The inhabitants of Ronda are principally employed in agricultural and horticultural pursuits, though there are several manufactories of coarse woollen cloths and hats, two or three tanneries, and numerous water-mills. It is a place, also, of considerable commerce; its secluded, and at the same time, central situation, making it a convenient *dépot* for smuggled goods, in which, indeed, the present trade of Spain mostly consists. A very large fair is annually held here in May for cattle, horses, sheep, and general goods: it collects an astonishing concourse of people from all parts of the country, and offers an excellent opportunity for observing the costumes and shades of character peculiar to the inhabs. of the different provinces. "The society of Ronda is particularly good, consisting of some of the most ancient Andalusian families; who, with all the polish of the first circles, are exempted from the demoralising vices which distinguish the fashionable inhabs. of Madrid and other large cities. On the whole," continues Captain Scott, "I scarcely know a place where, a few weeks more agreeably spent." (*L. 118.*) The climate of Ronda, also, is very delightful; neither oppressively hot nor disagreeably cold; and it is considered so favourable to longevity, that it has become a common saying,—"En Ronda los hombres de ochenta años son pollones" (at Ronda even men at eighty are chickens.)

The neighbourhood is not only extremely picturesque, but produces an abundance of wine, oil, and corn, as well as the fruits and vegetables peculiar to a more N. climate. Cattle graze in large herds on the plains, and the hills abound with many varieties of game, including deer and wild boars. About 3 m. S.E. of Ronda is the singular mountain, called *Cresta de Gallo*, consisting of two parallel ridges joined at the bottom, one red, the other white: both of them possess mineral riches, which, under a better system of national economy, might, probably, be turned to good account. Ronda has been supposed, though, perhaps, with little foundation, to owe its origin to the Romans. Nothing certain, however, is known respecting it prior to the domination of the Moors, who made it one of their principal strongholds. In 1331 it became the court residence of Abou-Melic, son of the emperor of Fez, who erected the castle and fortifications. It was finally taken from the Moors by Ferdinand of Castile in 1485. (*Scott's Ronda and Granada*, i. 99-129.; *Mod. Trav.*; *Mifano, &c.*)

ROSCOMMON, an inland co. of Ireland, prov. Connaught, having N. Leitrim and Sligo, E. and S.E. Longford, Westmeath, and Kilmag. County, from which it is separated by the Shannon, S.W. and W. Galway, from which it is separated by the Suck, and Mayo, Area 609,405 acres, of which 131,063 are bog and mountain, and 24,787 water. There are some mountainous tracts in the N. parts of the co., and elsewhere; but, speaking generally, its surface is nearly flat, exhibiting, for the most part, either green fields or bogs. Substratum principally limestone.

Pastures most luxuriant. Stone fences, so common in Scotland, are, in Ireland, nearly peculiar to this co. Estates very large; many of them, however, are let on perpetual leases, the holders of some of which form an intermediate class between the great proprietors and the occupiers. A large proportion of land in pasture; but latterly tillage has been rapidly extending. Several improvements have been introduced both in the plan of husbandry and in the instruments employed in carrying it on. "But the general system of agriculture, excepting on lands held by wealthy individuals, still remains (1832) a very imperfect state; and the smaller farms are cultivated in a manner as often slovenly and wasteful." (*Weld's Survey of Roscommon*, p. 654.) Tillage farms generally small. Oats and potatoes principal crops; but wheat is now rather extensively cultivated. A good deal of work is done by the *loy*, a species of spade. Cattle, long-horned; sheep, long-wooled; both breeds good; few dairies. Average rent of land, 13s. an acre. Some new cottages, on a few estates, are neat and comfortable, but the great majority continue to be as bad as possible. The same may be said of the farm buildings.

There are veins of coal and ironstone in the N. parts of the co., to the W. of Lough Allen. These had been occasionally worked to some extent for a considerable period, but in general to the heavy loss of those by whom the works were carried on. It was, however, contended that this happened from the want of capital, or want of skill on the part of those employed; and the most exaggerated and delusive accounts were, at the same time, published of the value of the mines. At length, during the memorable year 1825, three companies were formed for working the coal and iron mines at Arigna and other places in this co. One of these, after examining the ground, prudently declined proceeding any farther: the energies of another were paralysed by the fraud, jobbing, and mismanagement of some of its directors and agents; and the third (the Irish Mining Company), an enterprising and well-conducted association, ultimately abandoned the undertaking, their collieries having proved, if not absolutely worthless, not worth the cost of working them. (*Weld's Survey*, p. 33, 77, 682, &c.) The linen manufacture was at one time pretty extensively diffused over the co., but it has latterly very much fallen off. Being washed throughout its whole extent by the Shannon, few Irish cos. have greater facilities than Roscommon for the easy and convenient disposal of their products. It is divided into 6 baronies and 56 parishes, and sends 2 mems. to the H. of C., both for the co. Registered electors, in 1839-40, 2,062. Principal towns, Roscommon and Elphin. In 1831, this co. had 41,369 inhab., houses, 44,252 families, and 249,613 individuals, of whom 123,031 were males, and 126,582 females.

ROSCOMMON, an inland town of Ireland, prov. Connaught, cap. of the above co., 6 m. W. from Lough Ree, and 78 m. W. by N. Dublin. Pop. in 1831, 3,336. It has a par. church, a Rom. Catholic chapel, a public school, a market-house, a cavalry barracks, an extensive modern co. court-house and gaol, and an infirmary. Races are annually held in the vicinity. Under a charter of James I., in 1612, the corporation, which consisted of a sovereign, 12 burgesses, and a commonalty, returned 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. It principally occupies the S. slope of a gently rising hill; but it is straggling, ill-built, and poor, its hovels stretching along the principal lines of road by which it is approached. Latterly, however, it has been somewhat improved. In summer, it suffers from a deficiency of water. A manor court holds pleas for debts to the amount of 10*l*. The co. assizes are held here; as are general sessions twice a year, and petty sessions every Monday. It is a constabulary station, and has manufactures of coarse woollens, linens, and brown pottery, for the supply of the immediate neighbourhood. The trade in corn is increasing. Markets on Saturdays; fairs on Whit-Monday and 5th Dec. Post-office revenue, in 1830, 800*l*.; in 1836, 966*l*. Branches of the Agricultural and National Banks were opened here in 1836. The ruins of an old Dominican abbey, founded in 1257, has a fine monument of its founder, one of the O'Connor family. Here, also, are the remains of a fine old castle, built by the English soon after their entry into this part of the co. The town, and a considerable contiguous estate, which has hitherto been much neglected, is the property of the Earl of Essex. (*Statistical Survey*; *Fraser's Guide*.)

ROSCREA, town of Ireland, prov. Munster, near the N.W. extremity of the co. Tipperary, finely situated between the Slieve-Bloom and Devils-bit ranges of hills, on a branch of the lesser Brossa, 40 m. N.E. Limerick. Pop. in 1831, 5,512. It is of great antiquity, having been made the seat of a bishopric in the 6th century, united to Killaloe in the 12th. Some remains of the old cathedral may still be seen in the W. front of the par. church; it has also a fine stone cross, a pillar tower, an old castle built by the Ormonde family, and

the ruins of a Franciscan monastery. The town is irregularly built. Among the public buildings are the par. church, a Rom. Catholic chapel, meeting-houses for Quakers and Methodists, a school on the foundation of Erasmus Smith, a fever hospital, cholera hospital, and dispensary, market-house, bridewell, and barrack. A manor court, which holds pleas, to the extent of 10*l*. Irish, sits monthly; petty sessions are held on Mondays. It is a constabulary station. It manufactures coarse woollens, has several flour mills, two tanneries, two breweries and a distillery, and carries on a very extensive trade in grain; the retail trade is also considerable, the surrounding country having a more than usual number of resident gentry. Markets on Mondays and Thursdays; fairs on 25th March, 7th May, 21st June, 8th Aug., 9th Oct., and 29th Nov. Post Office revenue in 1830, 814*l*.; in 1836, 874*l*. Branches of the Agricultural and National banks were opened in 1835.

ROSETTA, or ROSSETTA (Arab. *Rashid*), a town and sea-port of Lower Egypt, on the W. branch of the Nile (the anc. *Robbitine* mouth), near its embouchure, 36 m. E.N.E. Alexandria. Down to a late period, it was one of the most important commercial towns in the country, and had a pop. estimated to amount to about 25,000, but since the opening of the Mahaloudi canal from Alexandria to the Nile, Rosetta has sunk into comparative insignificance; its pop. has dwindled down to about 4,000, and the principal traffic consists in the removal to Alexandria of the bricks, and other materials, of its buildings! It was principally constructed of red brick, plastered over and whitewashed. As elsewhere in the East, the streets are narrow, and the upper stories project, so as frequently to meet. Upon the whole, however, Rosetta is neater than many oriental towns, and its situation in the midst of date, banana, and orange groves, is distinguished for beauty. The inhabs. are principally occupied in the rice, cotton, sailcloth, and leather factories established by the Pacha, at a wretchedly low rate of wages. There are now no resident merchants in Rosetta, and its shipping, which was formerly considerable, is reduced to a few boats. The port, though tolerably secure within, is difficult of entrance, there being a shifting bar at the mouth of the river, which can only be passed with safety during favourable winds, and at certain times of tide. Rosetta is famed for the supposed salubrity of its air, which attracts visitors thither during the summer and autumn months. It was founded by one of the caliphs about 870, near the site of the anc. *Robbitum*, but has no antiquities of its own. Here, however, was discovered the famous *trilingual* tablet, called the "Rosetta stone," to which we are mainly indebted for the discoveries of Young and Champollion. (*Private Information*.)

ROSS AND CROMARTY, two cos. of Scotland, in the Highlands, forming together a maritime district of great extent, stretching quite across the island, and including Lewis, in the Hebrides. These cos., though in some respects distinct, are united under one sheriff, and Cromarty being a small co., consisting of several detached portions, most of which are wholly surrounded by parts of Ross, they may be most conveniently noticed under one head. They are bounded N. by the co. of Sutherland, E. by the Friths of Dornoch and Moray, S. by Inverness, and W. by the Atlantic. Area, 1,904,000 acres, of which 1,532,400 are mainland, and 375,200 islands; the freshwater lakes cover a space of 44,800 acres on the mainland, and of 12,800 in the islands. The E. parts of the prov., consisting of the districts called the Black Isle, or the Peninsula, between the Beaully and Moray Friths, the Frith of Cromarty; and Easter Ross, or the Peninsula, between the Friths of Cromarty and Dornoch, are comparatively flat and fertile. Easter Ross has a considerable extent of clayey loam, and of light sandy soil. The soil of the Black Isle is very various; much of it is poor, but the cultivated portion consists principally of clayey loam, good black mould, and sandy loam. In Strathpeffer, and the country round Dingwall, the soil is clay; but with these exceptions the rest of the co. is wild, dreary, rugged, and mountainous, interspersed with lakes, and narrow glens, that afford pasture for sheep and black cattle. Estates, for the most part, very large; but there are several that are not of much value. Farms of all sizes; but the number of small occupancies, though still very considerable, is much diminished. Native breed of cattle hardy, compact, and well suited to the country; but in the W. parts of the co., the Skye and Argyleshire breeds, or one closely allied to them, is most prevalent. Cattle were formerly much more abundant than at present. Sheep-farming has, for many years past, engrossed almost the whole attention of the principal farmers and improvers; so that, beside a decrease in number, it is also said, that the breed of cattle has deteriorated. This, however, has been denied by others; and, at all events, the baneful practice of overstocking is no longer carried to any thing like the extent to which it was formerly prac-

tised in this, as well as in other Highland co's. At no very distant period, oxen were extensively employed in field-labour; but they are no longer used for this purpose. All sorts of improvements, both in breeding and cropping, have been tried by the principal proprietors, and by many intelligent and enterprising sheep farmers that have immigrated thither from the S. Most part of Easter-Ross, great part of the Black Isle, with the country round Dingwall, and along the N.W. shore of the Inner Frith of Comarty, now ranks with the finest districts of Scotland. It is traversed in every direction by excellent roads, is well fenced, and has a more than usual number of seats and plantations. Agriculture has been wonderfully improved; and the crops of wheat and turnips are at present now inferior to those in the more S. co's. But exclusive of these districts, a great extent of mountainous country is still occupied by the old Highland tenantry. These are a brave and hardy race; but poor, and without either enterprise or industry. They occupy the straths or valleys between the mountains, and along the banks of the rivers, which in some places are so thickly tenanted, that there is a family for every Scotch acre of arable land. On this they raise oats, bear, or bigg (a species of barley), and potatoes; frequently cultivating the ground with a crooked spade (cachrom) instead of a plough. The mode of ploughing, which was formerly general over the whole country, and which is still practised by the smaller tenants, is barbarous in the extreme. The smaller tenants uniformly possess a considerable extent of grazing ground, which is commonly contiguous to, but sometimes at a considerable distance from, their arable possession. Their huts are for the most part wretched; few of them have either chimneys or windows; they prefer, indeed, living in the midst of smoke and filth; and in winter, the cattle are generally housed under the same roof with the family. Except for a few months, when sowing or reaping their crops, preparing and saving their fuel, &c., the greater part of their time is spent in the pursuit of game, in fishing, or in idleness.

Previously to the reduction of the duties on whiskey, in 1823, illicit distillation was very prevalent, and is still carried on, though to a comparatively small extent. "It cannot be said with truth that the class of people of which the great majority of the pop. consists enjoy the comforts of life in even a moderate degree. Poorly fed, scantily clothed, and miserably lodged, theirs is a life of penury and toil; exposed to the temptations of idleness, without its ease, and to the slavery of labour, without its rewards, they drag out a wretched existence, suffering under the continual fear of impending want, and uncheered by any prospect of amendment in their condition." (Art. *Parish of Glemsiel; New Statistical Account of Scotland*, No. 12., p. 200.) Under these circumstances, no reasonable person can doubt that the measures adopted by many landlords during the last half century for consolidating the small possessions held by the native tenants, and introducing farmers possessed of capital and skill, have been, in a public point of view, eminently beneficial. In some instances the change may have been hastily effected; and we hesitate not to say that it has, on the whole, been highly advantageous to the peasantry themselves. Having been obliged to repair to villages or to emigrate, they have also been obliged to lay aside their slothful habits; so that, in point of fact, not only the wealth and industry, but even the pop. of the country, has gained materially by the introduction and extension of that sheep farming system that has been the theme of so much ignorant vituperation. In proof of this, we may observe that the pop. of this district amounted, according to the enumeration of Dr. Webster, in 1755, to 47,466. In 1800, it had increased to 55,877; and, notwithstanding the increase of sheep-farming, and the prevalence of emigration in the interim, it amounted, in 1831, to 74,820. Minerals and manufactures of no importance. Average rent of land, including the Islands, in 1810, 1s. 1d. an acre. Principal rivers, — Conon, Orin, and Beaul. This district is divided into 33 parishes, and sends 1 mem. to the H. of C.; the bors. of Dingwall, Taln., and Cromarty being associated with others in the return of a representative. Registered electors for the co., in 1839-40, 713. In 1839, Ross and Cromarty had 15,039 inhab. houses, 16,837 families, and 74,820 inhab., of whom 34,927 were males, and 39,893 females. Valued rent, 87,940*l*. Scotch: annual value of real property, in 1815, 121,577*l*.

ROSS, a town and par. of England, co. Hereford, hund. Graytree, on the Wye, 15 m. W. by S. Gloucester. Area of par., 3,540 acres. Pop. of do., in 1831, 3,078, of which the bor. had about 2,000. The latter is finely situated on an embankment above the river; but its streets are steep, rough, and narrow. The church, in a conspicuous situation, has a lofty spire, and is partly in the perpendicular style, but, according to Rickman, it has been injured by alterations and repairs. The living, a rectory and vicarage, is in the patronage of the bishop of Hereford, is one of the best in the co., being

worth 1,284*l*. a year, nett income. There is a market-house, two charity schools, and an almshouse. In Camden's time Ross was celebrated for its cutlery and its cyder; the former, however, has entirely disappeared, but it continues to be distinguished by the excellence of the cyder made in its vicinity. It is governed by a serjeant and four constables. Market on Thursday.

The "Man of Ross," immortalized by Pope (*Moral Essays*, iii. lin. 250.), was a Mr. John Kyrle, a native of the town, where he died in 1724, at the age of 84. The splendid eulogium of the poet did not really go beyond Kyrle's merits. He expended his time and income in promoting objects of public utility and benevolence, by which the town continues to be benefited. His portrait is still preserved in his house, now an inn, near the entrance of the road from Gloucester.

ROSLIN, an inconsiderable village of Scotland, co. Mid-Lothian, near the N. Esk, 7 m. S. by E. Edinburgh. It is remarkable only for the ruins of its castle and chapel, and for the fine scenery along the river. The ruins of the castle, the extent and magnitude of which sufficiently evince its former strength and importance, stand on a peninsulated rock, accessible only by a lofty bridge. The era of its foundation is uncertain. It was for a lengthened period the residence of the St. Clairs, earls of Orkney and Caithness, some of whom lived here in almost regal splendour. It was taken and burnt by the English, under the Earl of Hertford, in 1544. The chapel of Roslin, at some little distance from the castle, is the most exquisite specimen of the florid Gothic in Scotland, and is in good preservation, having escaped, with comparatively little injury, the iconoclastic ravages of the Reformers. It was founded in 1445. The aisle is 69 ft. in length, 34 in breadth, and 40 in height, supported by two rows of clustered pillars, about 8 ft. in height, with an aisle on each side. The arches are Saxo-Gothic, and are extended across the side aisles; but the centre of the church is one continued arch, divided into compartments, and finely sculptured. The capitals of the pillars are enriched with foliage, and a variety of figures, most elaborately and minutely cut.

The Earls of Orkney and Roslin were interred in a vault below the floor of the chapel; and it is a curious fact, that down almost to the era of the revolution they were buried, not in coffins, but in complete suits of armour. This circumstance has been alluded to by Scott, in his fine ballad of "Rosabelle," in the "Lay of the Last Minstrel."

The glen in which the Esk runs from Roslin to Laswade is mostly narrow; has in parts high, precipitous, rocky, and well-wooded banks, and is celebrated for its romantic scenery. A little below Roslin, on the opposite side of the river, is Hawthornden, the seat of Drummond, the contemporary and friend of Ben Jonson, and one of the best poets of his age. The house stands on the brink of a precipice, overhanging the river, and, with the estate, is now in the possession of the descendants of the poet. Below the house are extensive caves, or apartments cut in the sandstone rock.

Roslin is much resorted to in summer by parties from Edinburgh; and most strangers who visit the latter, contrive also to visit Roslin (*Pennant's Scotland*, iii. 254, ed. 1790; *Chambers's Gaz. of Scotland*, &c.).

ROSSBACH, a village of Prussian Saxony, 16 m. S. Halle, celebrated in modern history for its being the scene of the great victory gained on the 5th of November, 1757, by Frederick the Great, with little loss to his own forces, over the French and Imperialists.

ROSTOCK, a commercial city and sea-port of N. Germany, being the largest town, though not the cap. of the grand duchy of Mecklenburg-Schwerin, on the Warnow, 9 m. above its mouth in the Baltic, and 40 m. N.E. Schwerin; lat. 54° N., long. 12° 12' E. Pop., in 1837, 18,067. It is surrounded with old walls, and divided into 3 parts; the old, middle, and new towns. It has several suburbs, which, with the city, are built in an old-fashioned style. It has been frequently the residence of the grand dukes, and has a ducal palace, numerous churches, a convent, 2 hospitals, a town hall, theatre, &c. The church of St. Mary's is interesting from its having a monument in honour of Grotius, the illustrious author of the treatise *De Jure Belli et Pacis*, one of the greatest men of modern times, who expired here on the 28th of August, 1645, far from his family and friends, an exile from his ungrateful country. In one of the squares, thence called *Blucher's Platz*, is a statue of the celebrated Prussian general, Blucher, who was a native of the town. The university of Rostock, one of the oldest in Germany, was founded in 1419. It has 4 professors of theology, 3 of jurisprudence, 5 of medicine, and 10 of philosophy; besides 1 extraordinary professor, and 10 private teachers, having attached to it a library of 45,000 printed vols., theological and other auxiliary schools, an anatomical theatre, laboratory, botanical garden, and various scientific collections. It is, however, but poorly attended, having, in 1836, only 86 pupils. Rostock has a society of natural history, and other learned associations, and a

commercial institute. It is one of the most active manufacturing towns in N. Germany, having numerous woolen factories, breweries and distilleries, vinegar and soap-works, &c. Rostock has a pretty extensive trade. The exports consist chiefly of good red wheat, barley, pease, rappedseed, and a few oats; with wool, rags of a very superior quality, oil cake, rape oil, bones, flax, horses, cattle, provisions, &c. The average export of all kinds of grain may be taken at from about 115,000 to 130,000 qrs. a year; and the total value of all sorts of exports may be estimated at about 280,000*l*. The imports consist of colonial products, spices, wine, manufactured goods, &c. There belong to the port nearly 200 vessels of from 150 to 250 tons, which trade with most European nations, the U. States, and Brazil. The output of Rostock is Warnemünde, at the mouth of the Warnow. The depth of water at the latter varies from 10½ ft. to 12½ ft.; but when the W. pier, now in process of construction, shall have been completed, it is expected that the depth of water will be from 12 ft. to 14 ft. The depth of water in the river from Warnemünde up to Rostock is usually from 8 ft. to 9 ft.; so that vessels drawing more than this, must be lightened to get up to the latter. The commercial weights here are the same as at Hamburg. The duties are extremely moderate; on most imported articles, their amount, in privileged vessels, to only 3 per cent., and in other ships to 4½ per cent., *ad val.* An export duty of about 5*d*. per quarter is charged on corn, and of about 4*s*. 8*d*. per hind. on wine: wool is not subject to any export duty.

Rostock having been formerly one of the Hans Towns, had, for a lengthened period, and till lately, some exclusive privileges. Its vessels bore the flag, not of the grand duchy, but of the city of Rostock; and it had its own separate jurisdiction, independent of the rest of Mecklenburg; appeals from its tribunals being carried to the central court at Lübeck. But it has now only a court of secondary jurisdiction, with appeal to the tribunal at Parchim; and its other privileges have been either curtailed or abolished. (*Berghaus; Allg. Länder, &c.; Stein; Comm. Dict.*)

ROSTOFF, a town of European Russia, on the Don, about 22 miles above where it falls into the Sea of Azoff. Pop., about 8,000. It and the contiguous town of Nakhitchevan are the principal entrepôts of the trade of the vast countries traversed by the Don. The inhabs. of the latter are the more commercial, but Rostoff would seem to enjoy the special favour of the government, the *dépôts* of provisions for the army, the fortresses of the Caucasus, and of the eastern coast of the Black Sea, being established in it. The fort St. Dmitri, near the town, is a *dépôt* for the munitions of war required by the above-mentioned places. During the proper season there is a great deal of bustle and activity both here and at Nakhitchevan.

ROTHENBURG, a town of Bavaria, circ. Middle Franconia, cap. distr., near the Tauber, 40 m. W. Nuremberg. Pop., 5,700. It is beautifully situated, but irregularly laid out, and has few edifices worth notice. It was anciently a free city of the empire, and is surrounded by old walls flanked with numerous towers. It has manufactures of woollen stuffs, and an active trade in corn and cattle. (*Berghaus, &c.*)

ROTHERHAM, a manufacturing town, par., and township of England, W. riding co. York, liberty of Hallamshire, wap. Strafforth and Tickhill, on the Don, crossed here by a handsome stone bridge, and close to its junction with the Rother (whence the name), 6 m. E.N.E. Sheffield, and 142 m. N.N.E. London. Area of par. (comprising eight townships), 12,810; do. of township, 2,140 acres. Pop. of town, in 1831, 4,082. The town, partly in a valley, and partly on the sides of two steep hills, has several steep, narrow, and irregular streets, lined with indifferently-built stone houses. Recently, however, great improvements have been made, the streets having been widened, new houses built, and gas generally introduced. The court-house, gaol, market-house, and public library, are handsome modern buildings. The church (chiefly built by Archbishop Rotherham, in the 15th century, and by him rendered collegiate) is a large cruciform structure of perpendicular architecture, with a central tower and spire fully enriched with pinnacles, canopies, and crockets: "On the whole," says Mr. Britton, "this is one of the finest par. churches in the N. of England, and deserves the most attentive examination, both as to its composition and most of its details." (*Arch. p. 274.*) The living, a vicarage in the gift of Lord Howard of Effingham, is worth 170*l*. a year. There is an episcopal chapel in the township of Tinsley; handsome churches have recently been erected at Greaseborough and Thorpe, and a church is in course of construction at Kimberworth. The town has a Rom. Cath. chapel, and places of worship for Wesleyan and Primitive Methodists, Baptists, and Unitarians; besides which, there is at Marborough, on the other side the river, an Independent chapel, with an attached academy for the education of young men intended for the ministry belonging to that

class of dissenters. There are seven Sunday-schools, a Lancasterian school for 400 children of both sexes, two endowed charity schools, and a grammar school, founded in 1584, slenderly endowed, but conferring certain advantages on its pupils at the English universities. A dispensary was established in 1806; and there are almshouses for poor unmarried females. An ecclesiastical college, founded here at the close of the 15th century, was suppressed by Edward VI.; a part of the building is now used as an inn.

Rotherham, from its position in the middle of a district abounding with iron and coal, has long been distinguished for its manufactures of cast-iron; and during the American and French wars it almost exclusively supplied the navy with cannon. The iron-work for Sunderland, Southwark, and other bridges, was also cast here. The manufacture is still carried on with great vigour, new establishments have sprung up; and at present fenders, engine-work, and every variety of hardware, are manufactured on an extensive scale. Glass, starch, naphtha, and soap are also produced; a flax-mill employs about 100 hands, and there are 2 extensive porter-breweries. The town enjoys great facilities for the transport of its manufactured produce. The Don was made navigable to Tinsley, above the town, in 1720, and is accessible to Rotherham for vessels of 50 tons. A railway to Sheffield was opened in 1838, and the distance between the two towns (54 m.) is performed in about a quarter of an hour. The North Midland railway, also, passes close to the town, and the Marston station is, in point of traffic, one of the most important on the line. The distance by railway to London is 171 m., and the journey is accomplished in about nine hours. Large markets for corn and cattle on Monday; fairs, Whit-Monday and Dec. 11. The town has no regularly constituted municipal authority; but a body chosen by the inhabs., called "the feoffees of the common land of Rotherham," employ the proceeds of certain rents for the improvement of the town. The midsummer quarter sessions for the W. riding, and weekly petty sessions, are held here by the co. magistrates; besides which, there is a court of requests for the recovery of small debts. It is, also, the chief place of a poor-law union.

ROTHERSAY, a royal bor. and sea-port of Scotland, co. Bute, of which it is the cap., at the head of a beautiful bay on the E. side of the island, 30 m. W. by S. Glasgow. Pop., in 1837, 4,924. Fort Bannatyne, a favourite sea-bathing residence, is 2½ m. N.W. Rothersay. Being protected on the land side by surrounding hills, and towards the sea by the opposite coast of Argyll, only 3 m. distant, Rothersay has a very mild climate, and is much resorted to by sea-bathers, as well as by invalids. Exclusive of its castle, the principal public buildings are the town-hall and county buildings (under one roof), in the castellated form, with an elegant tower; two places of worship (one of them Gaelic), connected with the established church; and chapels belonging respectively to the Associate Synod, Cameronians, Independents, and Episcopalians. The parish church is situated ¼ m., and Mount Stuart, the seat of the Marquis of Bute, ¾ m., S. from the town. The means of education are ample: there are six public libraries in the town, and two reading-rooms; with various friendly societies and charitable associations. A savings' bank was established in 1821.

The cotton manufacture has been introduced; and two cotton mills employ 455 hands. But the fisheries may be said to be the most important, as well as the oldest, branch of business carried on. The salmon fishery obtains to a limited extent, as also that of haddocks, whiting, and soles. But the herring fishery is more extensive than all these together. The fishery, however, is not carried on in the Bay of Rothersay; or if so, only in a small degree; it centres chiefly in the Kyles (straits) of Bute, and the adjacent salt-water lakes; but it is principally carried on with Rothersay capital. In the year ending 5th of April, 1840, 17,119 barrels herrings were cured at Rothersay. About 60 vessels, of 3,000 tons, exclusive of steamers, belong to the port. There are 2 small building-yards, and 3 branch banks.

The castle of Rothersay, a noble ruin, is of great antiquity. It was at one time a favourite royal residence, and Robert III. expired in it. It was John, Earl of Bute, the favourite of George III., and Matthew Stewart, the mathematician, father of Dugald Stewart, were both owners of this bor. Previously to 1832, it joined with other bors. in sending 1 mem. to the H. of C.; but it is now merged in the co. representation.

ROTTERDAM, a celebrated commercial city of Holland, being, in point of pop. and importance, the second in the kingdom, prov. S. Holland, cap. arrond., on the N. bank of the Maas, where it is joined by the Rotte, whence its name, 17 m. (direct distance) from its mouth, and 35 m. S.S.W. Amsterdam; lat. 51° 55' 19" N., long. 4° 29' 17" E. Pop., on the 1st of Jan., 1840, 78,098, having increased about 10,000 during the previous ten years. It is creased about a triangular shape, the base of the triangle extending along the river. It is surrounded by a moat, and, like

every other Dutch town, is intersected by numerous canals, only one public thoroughfare, the High Street, being without a canal in its centre. This street, which runs in a direct line E. and W. through the city, is somewhat raised above the rest, being built upon the dam by which the Maas is prevented from inundating the country behind the town. Being the principal seat of retail commerce, it is lined with shops throughout. Rotterdam has a striking appearance from the river.

The fine quay, called the *Boompjes*, from the rows of trees with which it is planted, extends along the river for nearly a mile: behind the trees is a line of well-built houses four or five stories in height, mostly of dark-coloured brick, and having an aspect of much grandeur. The quay being crowded with shipping, this part of the city is the great seat of business, and presents a scene of incessant activity. "In penetrating through the town from the Boompjes, we come to street after street, each having a canal in the middle, lined with trees on both sides, and exhibiting a mixture of city and country fronts of houses, trees, and masts of shipping. The canals, or havens, stretch lengthwise and crosswise, like the meshes of a net, through the city; and at every short interval is perceived a drawbridge of white painted wood, constructed with ponderous balancing beams overhead, and raised by means of chains, for the passage of vessels. The ground beneath the trees is paved with small yellow bricks, and is chiefly occupied as quays for the landing of goods. The space from the trees to near the houses is paved in the usual coarse manner for carts and carriages, and here the foot passengers are generally obliged to walk, for small outshot buildings, flights of steps to doorways, and such like interruptions prevent any regular thoroughfare on the narrow brick trotters close by the houses. The havens are in a few places protected by chains from the streets, so that there is a constant liability to accidents, particularly at night, when the darkness is but poorly relieved by oil lamps dangling, Parisian fashion, from the ropes stretched betwixt the trees and the houses. Latterly a portion of Rotterdam has been lighted with gas; but according to a parsimonious plan, the lamps are not lighted when the moon is expected to shine." (*Chambers's Tour*, p. 5, 6.)

The houses of Rotterdam are generally on a large scale, and lofty; in many of the streets they are really elegant. Mr. Chambers speaks as follows of a large class of residences. "Each house may be considered the castle of a merchant, who both resides with his family, and carries on the whole of his commercial transactions within the same set of premises. The front part of the building exhibits an elegant door of lofty proportions, 15 or 20 ft. high for instance, at the head of a flight of steps. On getting a glimpse into the interior, you see a lobby paved with pure white marble, and a stair of the same material leading to the story above, which consists of a suite of lofty rooms, and is the main place of residence of the family.

"Some of the rooms are finished in a style of great elegance, with rich figured cornices and roofs, silk draperies to the windows, smooth oak floors, and the walls most likely painted as an entire picture or landscape, in oil, by an artist of eminence. Near to the door of the house is a coach-house door, which, on being thrown open from the street, discloses a wide paved thoroughfare leading to an inner court, the buildings round which are devoted to the whole warehousing department of the merchant. The bulk of the edifices of this great trading city are of the kind I describe." The ordinary houses are badly heated, and are in other respects not very comfortable; but the poorest house in the city is as clean as scrubbing and washing can make it, both inside and out; in this respect, indeed, the Dutch have no equals. Among the minor peculiarities which strike an Englishman, are the small mirrors affixed outside to almost all the first-floor windows, which are placed so as to show the inmates whatever may be going on in the street below. The want of good potable water is a great inconvenience.

Rotterdam has few public buildings of interest. The town-hall, a large modern structure in the Grecian style, has a noble council-room, with rooms for the city library and philosophical apparatus; but, though superior to the generality of such edifices, it is much inferior to that of Amsterdam. The exchange, on the contrary, is a finer building than that of the capital; it is rectangular, with a court in the centre, surrounded with arcades, supported by 30 pillars, each of a single block. The Schiedam palace, occupied in 1811 by Napoleon and Maria Louisa, is perhaps the finest of the public edifices. The custom-house and the former East India House on the Boompjes present nothing remarkable. There are from 15 to 20 churches, including one for English Episcopalians, and one for Scotch Presbyterians. The principal is the church of St. Laurence, formerly the R. Cath. cathedral. It is a large Gothic brick building, with a lofty square tower, and dates as far back as 1412; but nearly all its ancient ornaments were swept away at the

Reformation. In it are the monuments of the celebrated Dutch admirals, De Witt, Kortner, and Brakel, each of which has an appropriate inscription. It has also a splendid organ, said to be superior in size to the great organ of Haarlem, generally considered the largest in Europe. This is 150 ft. in height, mounted upon a colonnade about 50 ft. in elevation, and has, according to Harrow, 5,500 pipes, the largest being 32 ft. in height, and 16 in. in diameter. In the market-place is a bronze statue of Erasmus, the most illustrious by far of the natives of Rotterdam. The house where this great scholar, "the glory of the priesthood and the shame," but (as *quantum mulatus!*) it has been degraded into a gin-shop! Rotterdam has a naval dock-yard; but it is on a small scale, and contains little worth notice. In the neighbourhood of the city are many places of entertainment, as tea-gardens, &c.; and in the town are several clubs, where English as well as continental newspapers are taken in. Rotterdam is the seat of the marine department for the Maas, of the superior judicial courts for the prov., and of a tribunal of commerce; the cap. of the 9th militia district of the kingdom; and the residence of a military commandant, a director of police, and numerous foreign consuls. It has a society of arts and experimental philosophy, founded in 1767, branches of the Societies of Public Good and the fine arts, a college, a Latin school; many superior intermediate and poor schools, in the whole of which, according to Chambers, about 8,000 children are instructed; and various private academies. The central prison of Holland for juvenile offenders is at Rotterdam; it has also various workhouses and charitable institutions, and a savings' bank, paying interest at 4 per cent. There are manufactures of tobacco, refined sugar, needles, and pins, glass wares, corks, dyeing and chemical products, spirits, &c.; large markets are also held weekly for corn, flax, hemp, and other agricultural produce; and the annual fair of Rotterdam is the largest in Holland. (*De Cloet*.) Rotterdam is more advantageously situated in a commercial point of view than Amsterdam, or any other Dutch town. She is easily accessible from sea by the largest class of merchantmen; and from her position on the principal embouchure of the Rhine, as well as of the Maese, she is the grand emporium of the foreign trade of the countries which they traverse. The imports and exports are similar to those of Amsterdam, which see. The white Zealand and Rhenish wheat shipped here is of a superior quality; and it is the best market for madder, Geneva, chess, &c. The imports, in 1846, comprised, among other things, 20,115 tons coffee; 20,057 tons sugar; and 5,032 chests indigo, mostly from Java; with 13,305 bales cotton, 17,411 kids tobacco, 21,012 slabs Banca tin, &c. During the same year there entered the port 1,671 ships of the burden of 329,584 tons. Rotterdam has a regular intercourse by means of steam-packets with London and other great over-sea ports, and with Dusseldorf, Cologne, Maestricht, and other ports on the Rhine, Maese, &c. The railway from Amsterdam to Haarlem is to be extended to Rotterdam.

Besides Erasmus, the great painter Adrian Vander Werf, was a native of Rotterdam.

ROUBAIX, a manufacturing town of France, dép. du Nord, arrond. Lille, cap. caution, on the canal of Roubaix, 7 m. N.E. Lille. Pop., in 1839, ex. com., 13,426, or with com., 19,435. Like most Flemish towns, it is well built. It formerly laboured under a want of water; but of late an adequate supply has been obtained by means of Artesian wells. After Lille, Roubaix is one of the chief towns in the dép. for the manufacture of cotton goods; it has been estimated that, in the town, and immediately adjacent country, about 30,000 hands are alternately employed in the manufacture of cotton and woollen goods; the latter from about June to September, and the former during the remainder of the year. Mr. Symonds says, "of the various weaving and spinning districts of this manufacturing dép., there is none more prosperous than Roubaix, which has increased prodigiously within the last 10 or 15 years. The articles chiefly manufactured are Thibets, waistcoat-pieces, and thick cotton goods. There are about 12,000 looms in this district, of which half are Jacquard looms." The looms are principally in the factories; the manufacturers finding it necessary to preserve the privacy of their patterns. A weaver will, on the cotton goods, earn at an average 30 sous (15s.) a day; on the second class work, from 30 to 40 sous (15s. to 20s.); and on the Jacquard loom, from 2 fr. to 5 fr. per day, the average being about 3 fr.: these are gross wages. Nett earnings will be, weekly, about 12 fr. or 13 fr. for the Jacquard weaver, and from 6 fr. to 10 fr. for the plain weavers. Women and children obtain plenty of employment at the mills. Wages had risen by above 15d. in the last few years. I inspected a woollen spinning factory; the spinners were earning from 20 fr. to 24 fr. per week nett, as a matter of course; and it is by no means uncommon for them to earn 30 fr. nett. The girls earned about 7 fr. 30 cents, and the children 3 fr. per week. The rooms were all high, clean, and well

ventilated; and the machinery, built by an engineer at Rheims, though not of the newest description, was extremely good. The yarn spun was fine and even, and superior to what I have sometimes seen in Scottish mills. (*Handloom Weavers' Rep.*, pp. 123, 130.) The working pop. of Roubaix is increasing by continual immigrations from Belgium. Some of the labourers live in the town; but the greater number reside in the neighbouring villages and hamlets, coming daily to and from the factories, in which they work from 14 to 15 hours a day. They live mostly on meat, soup, potatoes, and beer; using butchers' meat 4 days a week. Symons says, that the morals of the working classes here are decidedly worse than in most other districts; but, according to Villermé, who, in this respect, is a better authority, the work-people of Roubaix and Tullebecq, are, whether as regards morals, cleanliness, clothing, lodging, food, or health, decidedly superior to those of Lille. Drunkenness is here, and, indeed, every where else throughout French Flanders, a prevalent vice; but, in other respects, the conduct of the work-people seems to be good; and they have established numerous societies for their mutual support and assistance. (*Villermé; Tableau des Ouvriers; Hugo; Dict. Géog.*)

ROUEN (an. *Rothomagus*), one of the principal cities of France, and the great seat of its cotton manufacture, dep. Seine-Inférieure, of which it is the cap., on the Seine, 44 m. (direct distance) from its mouth, and 67 m. N.W. Paris; lat. 49° 26' 27" N., long. 10° 55' 59" E. Pop. in 1836, 92,083; but if the inhabs. of all its suburbs be included, the pop. will amount to upwards of 100,000. (*Villermé, &c.*) This city, which stands in a fine and fruitful country, is most admirably situated on a navigable river, by which it communicates with the cap. on the one hand, and with the flourishing sea-port of Havre on the other; and it is surrounded by a verdant and delightful country. Its numerous spires and towers, and the vessels that throng its quays, give it a very imposing external appearance, to which its interior presents in most parts a striking contrast. Generally it is ill built. Streets mostly narrow, crooked, and filthy; houses principally of wood, or rather of lathe and plaster, though in the W. and newer quarters of the city some are built of more solid materials, and have even considerable elegance. It is oval; or rather lozenge-shaped, and was for a lengthened period pretty strongly fortified; but its ramparts are now demolished, and their place is occupied by a series of boulevards, which separate the city proper from the *faubourgs* Cauchois, Bouvreuil, Beauvoisine, Martinville, &c.

The Seine, here crossed by a bridge of boats, and one of stone, divides it from its large suburb of St. Sever. The boulevards, which are planted with trees, like those of Paris, and the fine broad quays and *cours*, which extend along the banks of the river, are the favourite and almost the only public promenades; the squares or open spaces are shabby and irregular, and except the *Place Royale*, near the centre of the city, are all of insignificant size. Some, however, are ornamented with public fountains, with which Rouen is well furnished: the *Fontaine de Lisieux* is a curious piece of antique sculpture, representing Mount Parnassus, with figures of Apollo, Pegasus, &c. In the square of La Pucelle, an indifferent statue of Joan of Arc is erected on the spot where that heroine suffered martyrdom in 1431.

The central parts of the city are the chief seat of general commerce; the upper classes principally reside in the *faub.* Cauchoise, and the N. suburbs; while the lower quarters at the E. end of the town, and the *faub.* St. Sever, are almost wholly inhabited by the manufacturing classes.

By far the most celebrated and striking public edifice is the cathedral, one of the noblest religious structures in France, or even in Europe. It was constructed principally between the 13th and 16th centuries inclusive: entire length, 434 ft.; breadth, 103 ft.; length of transepts, 174 ft.; height of nave, 89 ft.\* Its richly ornamented front has three fine portals, over the central of which is a square tower, and spire of iron work, reaching to a height of 464 ft.; flanked by two lofty but dissimilar towers, the *Tours Rouin* and *Georges d'Amboise*. The former, which dates from a period long anterior to the rest of the building, is in a simple and unadorned style; but the latter, built at the end of the 15th century, is much admired for the beauty of its architecture. It is ornamented with numerous sculptures; and before the Revolution contained an enormous bell, with many others belonging to this cathedral, was then sent to the cannon foundry. The interior of the edifice is lighted by 130 windows, many of which are ornamented with stained glass; and contains a vast number of tombs, including that of Richard I. (Cœur de Lion) of England, many dukes of Normandy, and 17 archbishops of Rouen; and the fine mausoleum of the

two cardinals d'Amboise. The latter is very perfect; but many of the other monuments were much mutilated in the religious and revolutionary wars.

The church of St. Ouen in the *Place-Royale* belonged to the oldest conventual establishment in Normandy, and occupies a larger extent of ground than the cathedral. It is an admirable specimen of the pointed Gothic: its fine octagonal tower rising from the centre of the building, is 255 ft. in height. The town-hall adjoining this church was originally a portion of the conventual edifice; and, besides various public offices, is appropriated to the museum and public library, with about 80,000 volumes. Several of the other churches in Rouen well deserve notice, and some are of high antiquity. The great city clock is placed in a square Gothic tower, erected in 1839, in the High Street. The *Palais de Justice*, with a noble saloon, was built for the parl. of Normandy, at the end of the 19th century. The manuscript halls of Rouen, for the exhibition and sale of different articles, are well adapted to their destination. They occupy three sides of a square, the centre of which forms an open exchange. A special apartment is devoted to every different kind of goods; the cotton-cloth hall, where the most important branch of traffic is conducted, is 290 ft. in length, by 53 ft. 4 in. in breadth. Every Friday, from 6 a.m. till noon, these halls display great commercial activity. There is another exchange adjacent to the quay. The *exchequer* office, *chambre des comptes*, barracks, the *bicêtre*, a spacious general prison, another prison for accused but untried persons, prefecture, archbishop's palace, mint, custom-house, college, 2 theatres, *hôtels*, &c., the general infirmary, which, according to Hugo, has commonly 2,000 inmates, Protestant church, and the remains of an old fortress, are among the other principal public buildings. Rouen has some private houses worth notice, especially those in which Fouteulle and Pierre Corneille were born; others in which are some curious works of art, &c. It is the seat of a royal court for the depts. Seine-Inf. and Eure; of tribunals of primary jurisdiction and commerce; a chamber of commerce, and council *des prud'hommes*, royal and university academies, a royal college, and a mint established in the 9th century; the cap. of the 15th military division of France; the seat of an archbishop, whose diocese comprises the dep. Seine-Inférieure, and whose suffragans are the bishops of Bayeux, Coutances, Evreux, and Séez; the seat of a Protestant consistory; and the residence of many foreign consuls. It has a central society of agriculture; societies of public education, commerce, agriculture, medicine, &c.; a Bible society; schools of despatch and navigation; a botanic garden; savings' bank, and various charitable institutions.

Rouen is so eminent for its cotton manufactures that it has acquired the title of the French Manchester, and checked printed cotton cloths for women's dresses, are commonly known in France by the name of *rouenneries*. It was anciently celebrated for its linen fabrics, the manufacture and dyeing of which appear to have been carried on in it in the earliest times of the French monarchy. But so late as the middle of the last century, the workmen employed at Rouen were nearly all foreigners, Germans, Dutch, or Swiss; who remained in France only during a part of the year, returning to spend the remaining months in their native countries; and less than 50 years ago, the cotton yarn employed in the manufactures was wholly spun by hand. At present, however, both water and steam power are largely employed. The whole region round Rouen shares more or less in its branches of manufacture. Mr. Symons says there are 930 spinning mills in Normandy and the Seine, and 920,000 spindles. (*Handloom Weavers' Report*.) The prefect of the Seine-Inférieure, in 1835, estimated the weavers of cotton and woollen goods in that dep. to amount to about 130,000, 4-5ths of whom were resident in Rouen and its immediate neighbourhood; and Villermé (1840) states that 80,000 persons, men, women, and children, or about half the entire pop. of the city and suburbs, are engaged in the cotton manufacture. (*Tableau des Ouvriers*, l. 138-9.)

"The manufacturers of Rouen (says Mr. Symons) pride themselves greatly on the superiority of their products; and it is but justice to say that I have seldom seen printed cottons so good in colour and texture at 7d. per ell, as those of Rouen at that price. The goods produced by the Norman looms are in direct competition in third markets with those from the W. of Scotland. The wages of Norman weavers are, if any thing, lower than in Scotland, but provisions are at least 20 per cent. cheaper. So that no great difference is perceptible in the condition of the two classes; and were I to be forced to choose whether I would be a pullicate weaver in Scotland or in Normandy, I think I should be sorely puzzled which to select, or rather which to consider the greater infliction." (*Handloom Rep.* p. 125.) The nett wages obtained by country weavers working on their own account on pullicates, thick calicoes, &c., are about 1 fr. a day, or 5s. a week,

\* The dimensions are given by Hugo, and the Guide du Voyageur, in French ft., which are here converted into English feet.

and this may be taken as above, rather than below, the average. Children and women are both occupied in weaving at proportionate earnings. In the spinning mills, spinners get from 15 to 20 fr. a week, working from 80 to 84 hours; women and girls employed at the carding and drawing operations gain from 7 fr. to 10 fr. The power-loom weavers earn from 12 to 16 fr., and day labourers from 10 to 12 fr. a week. (*Hand-loom Rep.*)

In some branches, and especially that of spinning, wages diminished during the ten years preceding 1834; since which they have been somewhat augmented. According to Villermé, the working classes of Rouen are, upon the whole, in a much less depressed condition than those of Lille, and their health is also much better. Drunkenness is in both towns the prevailing vice among the lower classes; but it seems to be less prevalent at Rouen. The woollen manufactures of the city are unimportant; their chief seat in this dep. being at Elbeuf (which see). Broad silks, velvets, hardware, superior earthenware, chemical products, and confectionery, for which Rouen is famous, are the other principal products. Vessels of 200 tons ascend to the city, which carries on a considerable trade with the countries both in the N. and S. of Europe, the Levant, America, and the other maritime dep. of France; the greater part, however, of its foreign commerce is carried on through the intervention of Havre.

Rouen was of sufficient importance in the third century to be created a bishop's see; it afterwards became successively the cap. of the kingdom of Neustria, and of the duchy of Normandy. Prince Arthur of Brittany having been put to death in Rouen, in 1203, by John King of England, Philip Augustus besieged and took the city in the year following. It was retaken by Henry V. of England in 1417, and retained by the English till 1449, when it was finally annexed to the French crown. The Reformation made great progress here; and the city suffered much in consequence of religious feuds. But fewer individuals fell victims to the Massacre of St. Bartholomew and the frenzy of the Revolution in this than in most other large French cities.

Rouen has given birth to some of the most illustrious individuals of whom France has to boast: amongst whom may be specified Pierre Corneille, deservedly sur-named *le grand*, one of the greatest modern dramatists, born here on the 6th of June, 1606; his brother, Thomas Corneille; Fontenelle, the academical, born here in 1657; Bochart, the famous oriental scholar; Daniel the historian; Brumoy, the author of the *Théâtre des Grecs*, &c. (*Hugo, art. Rouen; Villermé, Tableau des Ouvriers*, i. 135—166; *Hand-loom Weavers' Rep.*)

ROVEREDO (Germ. *Roverett*), a town of the Tyrol, on the frontiers of Austrian Italy, cap. circ. of its own name, on the Leno, near its junction with the Adige, 13 m. S. by W. Trent. Pop. 7,300. It is well built, many of its edifices being of marble. The most remarkable building is the castle, on a height commanding the town. It has superior civil, criminal, and commercial tribunals for the circ., a gymnasium, and high school, and an English conventual establishment. In and round the town are un-acrons silk mills, with employ, according to the Austrian Encyclop., 8,000 hands. It has also tobacco and leather factories. (*Oester. Nat. Encyc.; Berghaus; Ramppold; Corografia*, &c.)

ROVIGNO, a sea-port town of Austrian Italy, circ. Istria, on the Adriatic, 39 m. S.S.W. Trieste. Pop. 9,800. It has numerous fine churches and other public edifices, high and female schools, and 2 hospitals. Its principal church is built after the model of St. Mark's at Venice. It is the seat of civil, criminal, and commercial tribunals; has 2 harbours, one of which is tolerably secure; and carries on a considerable trade in wine, olives, timber, anchovies, and tunny. Its inhabs. are principally sea-faring people, or engaged in the fisheries; they are, however, partly occupied in ship building and making cables. Near the town are some quarries of superior marble. (*Ramppold; Oester. Nat. Encyc.; Berghaus*.)

ROVIGO (an. *Rivigium*), a town of Austrian Italy, prov. Venice, cap. deleg. on the Adigetto, a branch of the Adige in the swampy tract of the Polesin, 36 m. S.W. Venice, and 17 m. N.E. Ferrara. Pop. in 1837, 5,699. It is fortified in the old style, with walls flanked with towers, a ditch, and a citadel; and is entered by 6 gates. According to Ramppold, it is rather a handsome town; but the *Austrian Encyc.* says, it is ill-built, and unhealthy. It has numerous churches, a seminary, and an hospital; 2 orphan asylums, a large and fine theatre, an academy of sciences and arts, and various superior public schools. The library of the Count Silvestri, comprising 36,000 vols., is open to the public. It is the seat of the superior courts for the deleg., and the residence of the delegate, and the bishop of Adria. Though much decayed, it has a considerable trade in corn, a large fair from Oct. 20. to 28., and 3 weekly markets. General Savary was created by Napoleon, Duke of Rovigo. (*Ramppold; Berghaus; Aust. Nat. Encyc.; &c.*)

ROULERS, a town of Belgium, prov. W. Flanders, cap. canton on the Mandelbecke, a tributary of the Lys,

26 m. W. by S. Ghent. Pop., in 1836, 9,982. It has a high school, manufactures of linen fabrics, leather, soap, oil, &c., and some trade in butter of a superior quality. (*Henschling; Dict. Géog.*)

ROXBURGH, an inland and frontier co. of Scotland, having N. the co. Berwick and a small portion of Mid-Lothian, E. and S. Northumberland and Cumberland, and W. Dumfries and Selkirk. Area, 457,920 acres, of which nearly a half is occasionally under the plough. It is partly intersected and partly bounded by the Tweed; and is traversed from its S.W. border, where it has its source, N.E. to Kelso, by the Teviot, whence it is sometimes called Teviotdale. It has every variety of surface, and soil. The low arable lands in the valleys of the Tweed and Teviot, consist principally of light turnip soil. The mountainous or pastoral district is principally in the S.W. parts of the co., along the Dumfries, Cumberland, and Northumberland border. The hills, however, like the Cheviots, to which they are contiguous, are mostly smooth, dry, and well covered with good sheep pasture. Property mostly in large estates; but there are several of the smaller class of proprietors. Farms generally large; and some farmers frequently hold three or more farms. Arable husbandry is as well understood and practised in the lower parts of this co. as in the most improved parts of the empire. It is also celebrated for having been the theatre where some of the principal improvements in modern farming were first introduced, and where others were first successfully practised in Scotland. Mr. Dawson, the great improver of Scotch husbandry, occupied the farm of Frogden, near Kelso, in this co.; and in it, soon after 1760, he set to work the first plough drawn by two horses, driven by the ploughman, that was ever seen in Scotland! And if Mr. Dawson was not the first to set the example of raising turnips, he was the first practical farmer by whom they were profitably cultivated on a large scale. (*Survey of Roxburgh*, pp. 69, 90.) Farmers for dressing corn were also made and used in this co. before they were seen in any other part of Scotland. (*Ibid.*, p. 59.) Large quantities of wheat are now produced. Cattle, a mixed breed. Sheep, principally Cheviots. Within the last 30 years many important improvements have been effected in this district. A large extent of land that was entirely pastoral now bears luxuriant crops; bone manure has been introduced; agricultural management has been materially amended; a good deal of waste land has been planted; farm-houses and buildings have, in numerous instances, been rebuilt on approved plans; thrashing-machines have been erected on most considerable farms; and the habits and accommodations of the people have been materially improved. (*New Statistical Account of Scotland, Roxburgh*, p. 23, 33, 40, 125., &c.) There are some very productive orchards in the neighbourhood of Jedburgh, Melrose, and Kelso. Average rent of land, in 1810, 10s. an acre. Marl is found in vast quantities in several parts of the co., and it is also well supplied with limestone and freestone. Various branches of the woollen manufacture have been introduced, and are prosecuted with considerable vigour at Hawick and Wilton; and in a lesser degree at Jedburgh, Melrose, and Kelso. The par. of Kirk Yetholm, in this co., is celebrated as being the residence of the largest colony of gypsies in Scotland. Roxburgh contains 31 parishes; and returns 1 mem. to the H. of C. for the co.; and the bor. of Jedburgh joins with other burghs in returning a mem. Registered electors for the co., in 1839-40, 2,227. Principal towns, Jedburgh, Kelso, Hawick, and Melrose. In 1831, this co. had 6,732 inhab. houses, 8,530 families, and 43,633 inhabs., of whom 20,761 were males, and 22,902 females. Valued rent, 314,653l. Scotch. Annual value of real property, in 1815, 254,186l.

RUBICON. See ITALY, ante, p. 58.

RUDGELEY, a market-town and par. of England, co. Stafford, and E. div. of hundred of Gutfrestone, on the S. bank of the Trent, crossed here by a fine aqueduct of the Grand Trunk Canal, 8 m. E.S.E. Stafford, and 122 m. N.W. London. Area of par., 7,120 acres. Pop., in 1831, 3,165. The town is well built, comprising many good houses, and a few that may even lay claim to elegance. The par. church, an ancient structure, with a handsome tower at its W. end, has recently been enlarged and almost rebuilt. The living is a vicarage in the gift of the dean and chapter of Litchfield. There are places of worship for different classes of dissenters, and several Sunday-schools. A free grammar-school was founded here by Queen Elizabeth: an endowed school furnishes clothing and instruction to 35 boys; besides which there is a national and infant-school. Hopkins's Almshouses afford relief to aged poor women, and there are several money charities. The principal manufacture of Rudgeley is that of hats and felts; but other articles are made here. A stream, which runs through the town to the Trent, turns several colour and corn mills, and there are some iron-forges. At Brereton, within the par., are extensive collieries, employing from 500 to 600 men. The town derives considerable advantages from its position on

the great line of canal communication between the N. and S. cos. Its government is vested in 2 constables, chosen by the inhabs. Markets on Tuesday: fairs April 17, June 5, and Oct. 21., for horses and cattle.

RUGBY (an. *Roccheville*, or *Rokby*), a market-town and par. of England, co. Warwick, hund. Knightlow, on the Avon, 28 m. E.S.E. Birmingham, and 75 m. N.W. London. Area of par. 2,190 acres: pop., in 1831, 2,501. The town, on an eminence S. of the river, consists of 3 streets, one of which, leading to the church, is broad, and lined with modern brick houses: indeed, great improvements have been made within the last few years, and the advantages derived by the town from its proximity to the Birmingham Railway seem likely still further to promote its prosperity: in the older part of the town, however, there are many houses of plaster and timber, denoting the former poverty of the place. The church is an ancient building, possessing little architectural interest, with a square embattled tower, having a turret at its S.E. angle: the living is a rectory, of the annual value of 510*l.*, in the gift of Earl Craven. There is also a district church, of very recent erection. The Wesleyan Methodists and Baptists have places of worship; and there are several Sunday-schools, a charity school for 30 children of each sex, with almshouses and other charities. The chief importance of Rugby, however, is derived from its great public school, to which the talent of several of its recent masters and the richness of its endowments have given a well-merited celebrity. It was originally a simple grammar school, founded in 1557, by Lawrence Sheriffe, citizen of London, a native of the neighbourhood, for the benefit of the town and neighbourhood of Rugby. Any person who has resided during 2 years in, or within 10 m. of the town, may send his sons to be educated free of expense; but if the parent reside out of the town, his son must then lodge at one of the boarding-houses of the school, paying the same rate for his board as those not on the foundation. The number of boys on the *foundation* is unlimited; but the masters may not receive more than 250 boys, not on the foundation. The number of scholars may at present average about 280, about 60 of whom are on the foundation. The school property consists of land within the par., and of about 8 acres of land, called the Conduit Close, in the neighbourhood of Lamb's Conduit Street, London; the value of which has so greatly increased, in consequence of the buildings erected upon it, that the annual revenues of the school, which, at the middle of last century, were under 120*l.* a year, now exceed 5,000*l.* The management is vested in 12 trustees; and the school is under a head master and eight classical masters, with subordinate teachers of writing, French, &c. The study of classical literature is carried quite as high as elsewhere, and the success of the boys at examinations for scholarships at Oxford and Cambridge, shows that their knowledge is of a substantial character; but at the same time, history, both sacred and profane, modern as well as ancient, physical and political geography, arithmetic, and mathematics (as far as conic sections) and French, constitute integral parts of the course of instruction. An annual examination is held at Christmas, and the names of the boys that distinguish themselves are published in a class-paper. The school has 14 exhibitions, established by the founder. Three exhibitioners are elected every year by the trustees on the report of examiners sent from the universities of Oxford and Cambridge. These exhibitions are of the value of 60*l.* a year, and may be held for seven years *during residence* in any college at either university. There are likewise six scholarships, of the annual value of 25*l.* each, supported by subscription: one scholar is elected every year, and his age must not exceed 14½ years at the time of his examination. The scholarship is tenable for six years. If the boy holding it remains so long at Rugby. The ancient buildings of this great seminary consisted formerly of a master's house, and two or three school-rooms, all of very limited size and shabby exterior, totally inadequate to the wants of the increasing establishment. In 1809, however, the erection of a large and handsome pile of buildings was commenced on the site of the old school-house at the S. extremity of the town. The edifice is of white brick, dressed with stone at the angles, windows, and cornices, the whole being of Tudor architecture. The principal front is 220 feet in length, and the schools are entered by a turretted gateway facing the street and leading to the principal court, a fine area, 90 ft. in length, by 75 ft. in breadth, having cloisters on three of its sides. The buildings on the S. side comprise the dining-hall of the head-master's boarders and three school-rooms; on the W. side is the great school-room, and on the N. side are schools for the French and writing classes. The apartments of the head master are handsome and commodious, communicating also with the various dormitories running round the quadrangle over the school-rooms. The school-chapel is a detached building. In the later pointed style, the interior being fitted up with stalls and handsomely carved

seats; the ceiling is decorated with paintings, and near the altar is the statue of Dr. James, a late head master, by Chantry. Rugby has no manufactures, and the inhabs. of the vicinity are principally agricultural. The trade of the town, however, has been greatly increased by the opening of the Birmingham Railway, which has one of its stations here; and it is now an important *entrepôt* between the surrounding country and the metropolis. The Oxford Canal passes, also, within a short distance of the town, connecting it with the principal inland navigation of England. On an eminence N.E. of Rugby are some slight remains of a castle, supposed by Dugdale to have been erected in the reign of Stephen. Large markets on Saturday for corn and provisions; a great horse fair Nov. 22., and 12 other fairs. (*Char. Comm. 29th Report*; *Journal of Education*, vii. 234–243; *Railway Handbook*, &c.)

RUGEN, an island in the Baltic, belonging to Prussia, opposite to Stralsund, and separated from Pomerania, by a strait varying from 1½ to 2 m. in width. It is of an exceedingly irregular shape, being deeply indented by bays and arms of the sea. Area, 361 sq. m. Pop., about 30,000. It is very fertile, and sends annually large quantities of corn, &c. to Stralsund. Rugen differs much in appearance from the mainland part of Pomerania, its coasts consisting mostly of high, precipitous, chalky cliffs. It is well wooded; and being intercepted by ravines, as well as deep narrow bays, its scenery is highly picturesque. This circumstance, and its facilities for sea-bathing, render it a favourite resort in summer. The inhabs. are primitive in their habits and manners, industrious, and frugal. They are principally of the reformed religion; and their language is a patois of low German intermixed with Swedish. The fishing in the adjoining seas and bays is very productive. Unfortunately the island has no good harbour, and its coasts are very dangerous. A lighthouse, having the lantern elevated 157 ft. above the level of the sea, has been erected on the most northerly promontory of the island, in lat. 53° 41' 12" N., long. 13° 57' 27" E. Bergen, the capital, situated in the centre of the island, has 2,700 inhabs. After being long in possession of Sweden, Rugen became part of the Prussian dominions in 1815.\*

RUNGPOOR (*Rangapora*), a distr. of British India, presid. and prov. Bengal, between lat. 25° and 27° N., and long. 88° and 91° E.; having E. Assam, S. Mymensing and Dinajpoor, W. the latter and Purneah, and N. Sikkim and Bootan. Area, 7,856 sq. m. Pop., in 1822, 1,340,350. It is wholly on the N. side of the Ganges, and is intersected by the Brahmaputra and Teesta. The climate is not so hot as in most other parts of Bengal; the soil is inferior to that of the Dinajpoor district. Tobacco is the staple product. Wheat is also a considerable crop; barley, oats, maize, cotton, and indigo, are little grown. A good deal of cotton-thread is, notwithstanding, spun in the district, the material being imported by way of Moorsheadabad, &c. Total land revenue, in 1825–30, 1,063,178 rupees. Hindus and Mahomedans are supposed to be nearly equal in point of numbers. Chief towns: Rungpoor, the cap. Mungul-haut, Chilmay, and Goalparah. Rungpoor, in lat. 25° 43' N., long. 89° 22' E., has been estimated to have a pop. of from 15,000 to 20,000. For copious information respecting this district, and that of Purneah, the reader is referred to the surveys by Dr. Buchanan Hamilton, in *Martin's British India*, vol. iii.; *Parl. Reports*, &c.)

RUPPIN (NEW), a town of the Prussian dom. prov. Brandenburg, gov. Potsdam, cap. circ., on the lake of its own name, 37 m. N.W. Berlin. Pop. in 1837, 7,925. It is well built, and has a council-house, high school, hospital, central prison, barracks, and a large covered military exercising ground; with manufactures of woollen goods, gloves, and leather. Its trade is greatly facilitated by the Ruppin canal between the Havel and the Rhin, forming a link in the communication between the Elbe and the Oder. (*Berghaus*, &c.)

RUREMONDE, or ROERMOND, a town of Belgium, prov. Limbourg, cap. arrond., of the Meuse, where it is joined by the Roer, 37 m. N.W. Maestricht. It was dismantled by Joseph II.; but is still surrounded by ramparts, and is the residence of a military commandant. It is well built; is the seat of a court of primary jurisdiction, and a college; and has manufactures of woollen stuffs, and considerable trade.

RUSSIA, the most extensive, and one of the most powerful empires, either of ancient or modern times. It comprises the whole northern portion of the eastern hemisphere, from the frontiers of Posen and the Gulph of Bothnia on the W., to the Pacific Ocean and Behring's Straits on the E., or from the 18th to the 190th deg. of E. long., being a distance, on the 60th deg.

\* It is very probable that Rugen was at one time joined to the mainland; but there is no foundation whatever for the statement that it was separated from it by a violent storm in 1509.

of lat., of nearly 6,000 m. Its extent, from N. to S., though less vast, is still very great, stretching from the 38th to the 70th, and in some parts to the 78th deg. of N. lat., exhibiting an average breadth of about 1,500 m. And, exclusive of this, Russia claims a very large tract in the N.W. part of America; and is mistress of Nova Zembla, and some other large islands in the Arctic Ocean, of the Aleutian islands off Kamtschatska, and of the Åland isles, &c. in the Baltic. Her superficial extent has not been determined with any thing like accuracy. It was estimated by Hassel at 372,935 geog. sq. m., viz. Russia in Europe, including Finland, 72,869 sq. m.; Russia in Asia, 275,767 do.; and Russia in America, 24,000 do.: and Schnitzler, in his *Statistique Générale*, has adopted this estimate. The latest, however, and probably the most accurate estimate of the extent of this vast empire is that given by M. Kœppen, of the Academy of Sciences of Petersburg, in the employment of government. According to this gentleman, the area of its different great divisions is as follows:—

	Geog. sq. m.
Russia in Europe, including the portions of the governments of Perm, Orenbourg, and Viatka, that extend into Asia	81,016
Northern Asiatic Russia, or Siberia	250,818
Southern Asiatic Russia, or Transcaucasian provinces	5,381
Grand-duchy of Finland	6,506
Kingdom of Poland	2,267
American colonies	17,500
Grand total	364,388

N. B. This estimate, with the pop., is subsequently given more in detail.

The reader may, perhaps, acquire a better idea of the vast extent of the Russian empire, when he is told that it includes nearly one seventh part of the terrestrial part of the globe, and about one twenty-seventh part of its entire surface. But by far the greatest proportion of this prodigious superficies is almost uninhabited, and seems to be destined to perpetual sterility; a consequence partly of the extreme rigour of the climate in the provinces contiguous to the Arctic Ocean, and partly of almost all the great rivers by which they are traversed having their embouchure in that ocean, and being, therefore, inaccessible either for the whole or the greater part of the year.

**Face of the Country. Mountains.**—Russia is, in general, level, and comprises some of the most extensive plains in the world. That part of the empire which is in the eastern hemisphere is naturally parcelled into the two great divisions of European and Asiatic Russia, by the Oural mountains, which stretch in a N.N.E. direction from the Caspian Sea to the Arctic Ocean; forming, through the greater part of their course, the boundary between Europe and Asia. The highest points in this chain have an elevation of about 6,500 ft. above the level of the Caspian. In all the vast country, extending on the W. side of this central chain to the confines of Poland and Moldavia, there is hardly a single hill. The Valdai hills, or elevated grounds, between Novgorod and Twer, where the Volga, the Don, and the Dnieper have their sources, are nowhere more than about 1,200 ft. above the level of the sea, the country exhibiting a waving surface, and without any considerable elevations. There is nothing, in fact, save the forests, to break or interrupt the course of the wind, in all the immense space interposed between the Oural and the Carpathian mountains. The only great chain of mountains in western Russia's that of Caucasus, between the Euxine and Caspian Seas, and this is almost at the southern extremity of the empire. Siberia, or Asiatic Russia, consists principally of a vast plain, slightly inclining to the N. Towards the S. and E., however, it is in parts mountainous, being separated from Mongolia and Manchouria by high and little explored ridges, in which the great rivers that flow through it to the Arctic Ocean have their sources.

The most distinguishing feature in the appearance of Russia is her vast forests. Schnitzler, who estimates the surface of European Russia at about 400 millions of dectines, supposes that 156 millions are occupied by forests. They are so very prevalent in the governments of

Novgorod and Twer, between Petersburg and Moscow, that it has been said a squirrel might travel from the one city to the other without ever touching the ground. The forest of Volkonski, at the source of the Volga, is the most extensive of any in Europe. In the government of Perm, on both sides the Oural mountains, containing 18 millions of dectines, no fewer than 17 millions are covered by forests! The forests of Asiatic Russia are, also, of vast size. In extensive districts, however, the surface is quite free from wood. This is particularly the case in the vast steppes or plains in the governments of Astrakhan and Omak, which in many parts, indeed, are a mere sandy desert.

**Rivers and Lakes.**—The rivers of Russia are usually divided into five groups or systems, corresponding to the seas in which they have their embouchure, viz., the Arctic Ocean, the Baltic, the Black Sea, the Caspian, and the Pacific Ocean. The first division is by far the largest. It comprises, in Europe, the Dwina, Mezen, and Petchora; while in Asia it includes, among a host of others, the Obi, Jenissei, and Lena, three of the largest rivers of Asia. All these rivers run from S. to N.; and the last three have a course of from 2,000 to 2,500 m. The rivers which fall into the Baltic, though of far greater importance in an economical point of view, are of very inferior magnitude. The principal are the Neva, which has Petersburg at its mouth, the Duna, and the Niemen. The rivers which fall into the Black Sea equal those falling into the Baltic in commercial importance, and far exceed them in length of course and volume of water. Among others are the Dniester, Dnieper, Bug, Don, and Kuban. The basin of the Caspian has, however, to boast of the largest and most important of the rivers of Russia, the Volga. This great river has its sources in the government of Twer, about 180 m. S. by E. from Petersburg: including sinuities, its course is about 1,000 leagues, while that of the Danube is only about 450 l. (See VOLGA.) It is of vast consequence to the internal navigation of the empire. The Caspian Sea, also, receives the Oural and the Emba. Owing to the flatness of the country through which they flow, and the vast length of their course, the rivers of Russia are but little interrupted by cataracts, flow with a tranquil stream, and afford great facilities to internal navigation. The severity of the climate no doubt prevents, during a considerable portion of the year, all intercourse by water; and, as already stated, renders the rivers falling into the Arctic Ocean of comparatively little value. Luckily, however, the frost, which interrupts navigation, affords the greatest facilities to land travelling. (See post.)

The lakes, as well as the rivers, of Russia are upon a gigantic scale. The lake of Baikal, in the government of Irkutsk, in Asiatic Russia, is one of the most extensive in the world. In European Russia, the lakes of Ladoga, Onega, Pelpus, Ilmen, and Biela Ozero, are also of great extent, particularly the first. The duchy of Finland is almost every where interspersed with lakes, and they are very abundant in other provinces, particularly in that of Olonetz.

**Soil and Climate.**—These, it is obvious, must differ exceedingly in so vast a country. Some provinces mostly consist of sandy barren plains, or vast morasses. But the most valuable portion of the empire, or that included between the Baltic, the Gulph of Finland, and the Volga, on the N. and E.; the Black Sea on the S., and Austria, Poland, Prussia, &c., on the W., has, speaking generally, a soft black mould, of great depth, mostly on a sandy bottom, easily wrought, and very fertile. In some places it inclines to sand or gravel; in many, from the want of drainage, it is peaty or boggy; in Livonia, and parts of Lithuania, it is clayey, but it nowhere inclines to chalk. The following statements by Plescheyéff, whose accuracy is well known, contain all the information with respect to the soil and productiveness of the country that seems to be required in a work of this description. "Russia," says he, "is divided into two great parts by the Oural mountains, which form an uninterrupted barrier through its whole breadth, and separate Siberia or Asiatic from European Russia."

"That part of Russia which lies on this side of the Oural mountains, presents an immense plain declining westward by an easy descent. This plain, from its vast extent, has a great variety of climates, soils, and products. Its northern part, which sensibly declines towards the White and Frozen Seas, is covered with forests, marshy, and but little fit for cultivation. The other, and more southerly portion of this vast plain, includes the whole district along the Volga, as far as the steppes or deserts between the Caspian and the sea of Azov, and constitutes the finest part of Russia: generally it has a fertile soil, the arable and meadow land preponderating over the woods and marshes."

"That part of the country which extends towards Voroneje, Tambof, Penza, and Simbirsk, as far as the deserts, is most remarkable for the superior quality of every kind of fruit and other produce. It has every where an ex-

cellent soil, consisting of black earth, strongly impregnated with salt-petre. But the tract which commences between the sea of Azov and the Caspian, and extends near the shores of the latter, and between the Wolga and Oural, as far as the Emba, is little better than a desert, being level, dry, high, barren, and full of salt lakes.

"The country lying on the other side of the Oural mountains, known by the name of Siberia, is generally a flat tract of vast extent, declining imperceptibly towards the Frozen Ocean, and rising thence by equally imperceptible degrees, towards its southern border, where at last it is lost in the immense mountain ranges which separate the Russian and Chinese empires. It is unnecessary to notice in detail the different great divisions of this vast territory. As we proceed farther E., the climate in the same latitude becomes more and more severe, the summers shorter, and the frosts more intense. In general it may be stated, that the more southerly portion of Siberia, or that between the S. frontier of the empire and the 57th or 60th deg. of lat., as far E. as the river Lena, has, for the most part, a fertile soil; and that, notwithstanding the severity of the climate, it produces most kinds of grain. But, owing to the increase of cold and the nature of the soil, the more northerly portion of the region now noticed, or that extending from the 57th or 60th deg. of lat. to the Frozen Ocean, and the whole country E. of the Lena, from the frontier of Manchuria northwards, is wholly, or almost wholly unfit either for cultivation, or for the grazing of cattle. In the E. a portion of this vast tract is mountainous, but it mostly consists of immense levels, full of swamps and bogs, covered with moss, which would be totally impassable were it not that the ice, which never thaws deeper than a few inches, gives a firm under footing." (*Eng. Trans.*, p. 5.)

A country which, like Russia, extends from N. to S. through about 40 degrees of latitude, might be supposed to have almost every climate; and this is, in some measure, the case. "When spring commences in one division of this vast empire, another experiences all the rigours of winter. Here the parched camel traverses arid burning deserts; there the rein-deer courses over heaps of snow, under which he finds a scanty supply of moss. The Samoidé sleeps in his cabin, where the days are short and cloudy, while the Kirghisian feeds his flock under a clear serene sky. This variety of the products and diversity in the manner of living, gives Russia advantages not enjoyed by any other European country. She possesses, in the greatest abundance, all the most necessary articles, and the greater number of those which are reckoned luxuries; and she either furnishes or may procure all the products of different climates." (*Storch, Tableau de la Russie*, i. 6.)

But notwithstanding the heats that usually prevail during summer, especially in the southern provinces, cold, speaking generally, predominates very decidedly in Russia. With the exception, indeed, of the Crimea and the transcaucasian provinces, no part of Russia can be said to be generally hot; and even in them the frost in winter is often very severe. The climate of Russia is, in fact, proverbial for its severity; and this increases not only as we advance towards the N., but also as we advance towards the E.; the cold being decidedly greater in Siberia than in the same latitudes in European Russia, a difference which is also sufficiently perceptible in the provinces on the E. and W. sides of the latter. This, no doubt, is owing to various causes; but principally, perhaps, to the greater cultivation of the western provinces and their proximity to the Baltic; and to the vast extent of frozen sea and land traversed by the winds from the N.E. Beyond the 65th degree of lat. the ground is covered with snow and ice for about nine months in the year; and during the other three months ice is always found at a little distance below the surface. Corn crops cannot be depended upon in European Russia beyond the 62d degree of lat.; and the great agricultural provinces lie to the S. of the 58th deg. The fruits of temperate climates are seldom met with beyond the 52d deg. At Petersburg, in lat. 59° 56', the mean maximum of cold is about 24°, and the mean maximum of heat 23°, Reaumur. The Neva is commonly frozen over before the end of November, and the ice never breaks up before the end of March. At an average of ten years it is calculated that there are annually at Petersburg 97 bright days, 104 rain, 72 snow, and 93 unsettled. At Moscow, in lat. 55° 45', the cold is more severe than at Stockholm in lat. 59° 20'. At Astrakhan in lat. 46° 21', nearly the same as that of Lyons, the Wolga is sometimes frozen over so as to bear loaded wagons. The sea of Azov is usually frozen over from November to the beginning of April. In Siberia, as already stated, the cold is much more severe than in the provinces to the W. of the Oural mountains. The breaking up of the ice on the Lena does not take place before the beginning of May.

But this severe cold is not unhealthy, and is much less inconvenient than might be supposed. While the frost lasts the air is pure and bracing, and its severity is

guarded against by warm clothing, and by having the houses properly constructed and heated. At Petersburg and Moscow the winter is, in fact, the finest season. The Inhab. seem to revive at its approach. Sledge-roads over the snow render travelling commodious and agreeable; and a winter journey in a moderate frost by moonlight is a high enjoyment. The Russian peasants care only for warm covering for their legs and feet. At Petersburg, in a frost of 25° Reaumur, it is common to see women standing for hours together washing their linen through holes dug in the ice over the Neva!

Spring can hardly be said to have any place in the Russian calendar. The transition from frost to fine weather is usually very rapid. In a brief period after the snow and ice have disappeared, the fields and trees are clothed in the livery of summer, and vegetation makes an extraordinary progress. At Petersburg the summer is as mild and agreeable as in the S. of France; but there and in all the N. provinces it is very variable. As we advance towards the S. it becomes steadier, and the heats increase. At Astrakhan the mercury in the thermometer sometimes rises to 103° Fah.; and in the transcaucasian provinces it rises still higher. The autumn, or the period of transition from summer to winter, is the most unpleasant season in Russia. The sky is generally cloudy, and rains and storms are very prevalent. The Crimea, from its high S. lat., and its being unsheltered in the Euxine, has the most agreeable climate in the empire.

*Divisions, Population, &c.*—The divisions of the Russian empire have differed materially at different periods. Peter the Great made some important changes in the distribution that had existed previously to his epoch. The whole, however, was remodelled and placed on a new footing by Catherine II. in 1775. She divided the entire empire into three great regions: those of the North, Middle, and South. Each of these regions was subdivided into governments, of which there were at first 42, and at the end of her reign 50. Paul made some ill-advised changes on this distribution, which were set aside on the accession of Alexander. The existing divisions were mostly fixed by the latter, in 1822, nearly on the basis laid down by Catherine. The empire, exclusive of the kingdom of Poland, is divided into governments, exclusive of certain territories called provinces, or *oblasts*, not formed into governments. Some of these divisions, particularly those in Asiatic Russia, are of vast extent; but neither their boundaries nor their population are well ascertained. But, as the best that can be had, we subjoin M. Kœppen's table of the area and population of the different provinces included in the empire. [See top of next page.]

*Animal and Vegetable Products.*—The animals of Russia include those commonly met with in the arctic circle, and in temperate climates, as well as some of those belonging more peculiarly to the intertropical regions. Exclusive of horses, oxen, sheep, &c., reindeer and camel are both met with. The latter is employed in travelling through the deserts in some of the S. provs., while the former constitutes the principal wealth of the Samoides, Tungusians, Ostiaks, Tchouktchis, and other tribes inhabiting the extreme N. parts of the empire. The dog is common everywhere; and in parts of Siberia, where there are neither horses nor reindeer, is of the very greatest utility; and besides being employed for draught and burden, is used as food. Bears are abundant; beavers and other fur-bearing animals are also common; and in many provs. the chase forms a principal part of the occupation of the people. The rivers and lakes swarm with fish.

All sorts of corn succeed in Russia; though, as already stated, the crops cannot be depended upon above the 62d deg., nor is cultivation attempted in any part of the empire beyond the 65th deg. Fruits of all sorts are abundant in the S. provs. The vine is cultivated in the vicinity of Astrakhan, in the Crimea, and in the Caucasian provs.; but the wine made from it is of a very low quality. Though meadows are not abundant in Russia, the pastures in most parts are excellent. The forests will be afterwards noticed.

*Minerals, Working of Metals.*—The mines of Russia are of considerable importance and value. The principal are situated in the Oural and Altai Mountains, and in the mountains in the vicinity of Nertschink, in Siberia. Gold and platinum are both found in considerable quantities in the Ouralian Mountains, especially in the mines in the neighbourhood of Catherineburg; the former being also obtained from the Krilatof mine, &c. in the government of Tobolsk, and from various stream works in the Oural. According to the official returns, the gold and platinum obtained from mines belonging to the crown, and to individuals in the Oural, in 1836, were:—

Gold: crown mines	Private	Poods lbs.	Platina: crown mines	Private	Poods lbs.
129	17	17	20	17	20
134	21	21	117	25	25
263	38	38	138	42	42

NAMES, Area, and Population of the different Great Divisions and Governments included in the Russian Empire in 1838:—

\* The pop. of the old prov. of Omsk, suppressed in 1838, is wholly included in that of Tobolsk; in point of fact, however, it was assigned in part to Tobolsk, and in part only to Omsk.

Classified Account of the Population of the Russian Empire in 1836, according to the Official Statement published by the Minister of Finance:—

	Males.	Females.		Males.	Females.
Russian priests	52,551		Greeks of Nijni, gunmakers of Tula, &c.	10,882	10,940
Deacons and sacristans	65,178		Citizens of Bessarabia	37,905	56,176
Male children of priests, deacons, and sacristans	138,548		<b>Inhabitants of Villages.</b>		
<b>Total</b>	254,057	249,718	Peasants (that is, slaves), the private property of the emperor and the imperial family, peasants annexed to the crown, &c.	10,441,399	11,022,594
<b>Priests of the United Greek and Catholic Church</b>	7,825	7,518	Peasants the property of nobles	11,105,722	11,958,875
Roman church	2,197		<b>Wandering Tribes.</b>		
Catholic priests	173	315	Caluicks, Circassians, and Mohammedans of the Caucasus	215,715	261,982
Ancient priests	1,005	955	<b>Territory beyond the Caucases.</b>	(Nearly)	(Nearly)
Lutheran do.	51	37	Georgia, Armenia, Moldavia, &c.	689,117	680,150
Reformed church	7,850	6,071	Poland	2,977,311	2,110,911
Mohammedan Mollans			Finland	665,658	608,481
Lanians (Tartars)	150		Russian colonies in America	50,761	50,292
<b>Nobles.</b>			<b>Total of population</b>	28,806,925	30,257,515
Hereditary	284,731	255,429	Grand total of both sexes	59,155,566	
By virtue of service, &c., with their sons	78,922	71,275	In this table, however, and in that given above, the private soldiers of the army and navy, with their wives and children, are not included; so that the sum total, in round numbers, may be estimated at sixty-one millions. In addition to which must be reckoned the inhabitants of the mountains between the Black Sea and the Caspian, amounting to 1,115,000. There are also some wandering tribes of Circassians and others, whom it is impossible to number.		
Petty officers who have left the army, and are employed in the civil service, &c.	187,017	237,145			
Foreigners of all classes	22,111	15,215			
Military colonies	950,698	981,167			
<b>Inhabitants of Towns.</b>					
Merchants	151,347	123,711			
Shopkeepers, artisans, &c.	1,539,434	1,455,982			
Citizens in the eastern provinces	7,555	6,966			

In 1837, the same mines produced 309 poods 23 lbs. gold, and 118 poods 28 lbs. platinum; and exclusive of the above, the Siberian mines produced in the same year 160 poods of gold, of which 30 poods were extracted from silver. On the whole, therefore, the produce of gold in Russia, in 1837, must have exceeded 470 poods; that is, taking the pood at 36 lbs., and the price of gold at 4*l.* per oz., it must have amounted to 1,082,800*l.*

Silver is chiefly found in the Altai Mountains of Kholvano Voskressenski, and in the Siberian Mountains contiguous to Nertschuk. The annual produce of the silver mines exceeds 3,000 poods, or 108,000 lbs. worth, at 5*s.* 6*d.* an ounce, 334,600*l.* And if we add to the value of the gold and silver that of the platinum, the aggregate value of the three cannot be estimated at less than 1,500,000*l.* a year.

Copper is found in the government of Olonez, and in the Oural and Altai Mountains. It is produced to the extent of about 210,000 poods a year. About 40,000 poods of lead are obtained from the mines of Nertschuk and Kholvano. The iron-mines furnish a supply more than sufficient for the wants of the empire. The works in the Oural Mountains only are said to employ above 50,000 labourers; and iron is also procured in the Altai, Caucasus, the Valdai Hills, &c. The total product of iron is said by Schuitler to amount to 9 millions poods; and may now, perhaps, be taken at from 10 to 12 millions poods, or from 160,000 to 180,000 tons. Wood only is

used in the iron-works and foundries of Russia. Mercury, antimony, zinc, cobalt, &c., are found in Siberia.

Cast-iron articles are prepared at most mines where there are forges. There is an important cannon manufactory at Petrozavohsk, in the government of Olonez, which was brought to a high state of perfection by an Englishman of the name of Gascoigne. But the principal hardware manufactures are carried on at Tula, in the government of that name. (*See TULA*.) A great variety of articles of cutlery are produced; and the royal manufactory of fire-arms is very extensive, employing, it is said, about 7,000 male and 9,600 female workmen. (*Schuitler, La Russie, la Pologne, &c.* p. 315.) Very different statements have been made as to the quality of the arms produced at Tula. Those of Dr. Clarke were speedily confuted by the exploits of the Russian forces; and no doubt the manufacture has been since materially improved. At present we are assured, on undoubted authority, that though the arms produced at Tula be inferior in point of finish to those made in England, they are of very good quality.

Russia is abundantly supplied with mines of salt and brine springs; but as most of them are at a great distance from the Baltic and western ports, there is a large importation of salt from England and Austria. The salt mines and brine springs in the government of Taurida (the Crimea), are the most extensive, and furnish annually about 16 millions poods (nearly 260,000

tons): those of Perm, which annually supply about 7 millions poods, are the next in importance; the mines of Ilotsk, in the government of Orenbourg, furnish about 300,000 poods, exclusive of what is furnished by the salt lakes, and additional supplies are obtained from various other mines and springs.

**Agriculture.**—Landed property in Russia is generally divided into estates belonging either to the crown or the nobility. Some of those belonging to the latter are very extensive; but, owing to the compulsory division of estates among the children of a family on the death of the father\*, this is not generally the case; and the too great subdivision of the land is, in fact, one of the evils with which Russia is threatened. The peasants occupying the crown estates are in a state of *predial*, and those occupying the estates of the nobility are generally in a state of *absolute* slavery. The value of a Russian estate formerly depended more on the number of labourers or slaves belonging to it, and which may be either sold, or let out by the proprietor, than on its extent, or the quality of the soil: but since the increase of pop. this, in many districts, is no longer the case; and the proprietor is sometimes burdened with the charge of supporting and maintaining labourers, and paying the tax on them to government, for whose services he has little or no use. Different proprietors adopt different methods in the management of their estates. In the principal part of Great Russia, comprising all the central provs. of the monarchy, the system is very simple. The proprietors rarely farm any considerable portion of their estates, or interfere with the mode in which they are cultivated. They usually content themselves with distributing them among the peasantry; their revenue consisting in the produce of an *obrok*, or capitation tax, imposed on each male peasant, by way of rent. In the Baltic provs., on the other hand, the owners usually retain a quarter, or some less proportion, of their estates in their own possession, managing them either directly, or by the intervention of stewards or agents. The peasants on such estates are allowed cottages, having pieces of ground attached, generally, perhaps, about 15 acres, sufficient for their support; their obrok or tax being paid by labour, or *corvée*, performed on the lands held by the proprietor, or let by him to others. In the Ukraine and other S. provs., the peasants are partly free; and these pay for the lands they occupy, sometimes money, but more frequently produce and labour rents. There is also a class of small proprietors who cultivate their own lands, but who have not the privilege of holding slaves.

It may seem at first sight that, provided its amount were moderate, the system of parceling out land to occupiers charged with an obrok or capitation tax, could not be fairly objected to. And when such is the case, and the landlord allows the occupiers to reap the fruit of increased economy and exertion, this is no doubt the preferable mode of dealing with slaves. But the vice of the system is that, except on the crown estates, every thing depends on the will of the proprietor, who, though occasionally enlightened and liberal, is too frequently ignorant of his real interests, careless, and overburdened. The occupier has, in fact, no security whatever. If he improve his farm, or have about him the appearance of getting rich, the chances are that his obrok will be immediately increased; or that a portion will be taken from his farm, and given to another family. Even the predial slaves on the crown estates, from whom only a certain amount of labour or of *corvées* can be legally demanded, are frequently exposed to the extortion of those to whom the lands are let, or of the officers employed to superintend them. Hence, in the generality of instances, the peasants invariably follow a routine system; they avoid labour by which they are not to be benefited; and it is seldom, except on the lands managed by the proprietors themselves, or on those occupied by the few free tenants to be found in the country, that any considerable improvements are ever attempted. When the pop. of an estate parcelled among peasants is increased, a new distribution of the land has to be made; and, if unoccupied land cannot be assigned to the new families, they are provided for by diminishing the shares apportioned among the old ones. On such occasions, if the occupiers complain that their obrok or tax is too heavy, it is usual to grant those on whom the proprietor can depend, license to leave the estate; and, though they still continue slaves, many avail themselves of this permission, and migrate to towns where they exercise some trade or profession, from the profits of which they frequently pay a much higher obrok than was imposed upon them in the country, and accumulate sums with which to purchase their freedom.

It is evident from these statements, and from the influence of the compulsory division of estates in preventing improvements by the proprietors, that agriculture in Russia must be at a very low ebb. But though this be its general condition, it differs materially in different

provinces; and some estates, even in the most backward provs., have been greatly improved. In Livonia and the provs. bordering on the Baltic, and also in parts of the Ukraine, the husbandry is very superior, and the implements quite equal to the best that are to be met with in most parts of Germany. But, with the exception of a few estates, it is quite otherwise in the rest of the empire. The plough is there a wretched implement drawn by one horse, and calculated rather to scratch than to turn up the soil. The harrow is made of wood; and rollers and hoeing machines are entirely unknown. Were it not that the soil is generally light, friable, and very easily wrought, it would be impossible to cultivate it by such means. But these suffice to make it produce more than enough for the wants of the inhabs.; There is not, indeed, as Mr. Loudon has truly stated, another country in Europe where corn crops may be raised at so little expense of labour as in Russia.

Exclusive of the forests, and the sandy deserts of the south, vast tracts in the northern parts of the empire are, and always must be, unsusceptible of cultivation. Taking the whole surface of European Russia at 402 millions of deciatines, M. Schnitzler supposes that the cultivated land does not exceed 614 millions, and the meadows (chiefly in Livonia and Courland) 6 millions deciatines. (*Essai Statistique de la Russie*, p. 34.) The products vary, of course, with the differences of soil and climate. All sorts of corn are raised; but rye being the common food of the peasantry, it is produced in much greater quantities than any other sort of grain. Next to rye is oats; and the value of the crops of these two, taken together, is supposed to be more than double the value of the crops of wheat, barley, and of every other kind of corn. Orel, Kasan, Nijni Novgorod, Penza, Tambouf, and Koursk are the most productive provs.; and it is in them that the greatest quantity of wheat is raised. According to the official returns, which, however, in these matters are little to be depended upon, there were sown in European Russia, in the latter part of 1831, 20,349,149 chetverts winter corn (rye and wheat); and in the following spring, 30,398,046 chetverts spring corn: the return to the former being, at an average, 4 for 1, and that of the latter nearly 4 for 1. But, in the best districts, wherever the land is moderately well cultivated, the produce is much greater; and is, indeed, nowhere inferior to that of the most favoured countries. Corn in Russia is very frequently kiln-dried in the sheaf, before it is either stacked or thrashed. Flax and hemp are very extensively cultivated; and, besides what is made use of at home, are very largely exported. Potatoes succeed almost everywhere; and this, also, is the case with hops. Tobacco is confined to the S. provs., where it is an important article. It deserves to be mentioned, to the credit of the government, that it has latterly been exerting itself in the most efficient manner for the improvement of agriculture. Professorships of agriculture have been established in the different universities; and an institution to which a model farm is attached has been established near Mohilev for educating 120 pupils, so as to fit them to act as stewards or managers of large estates.

Horses are very abundant in Russia. Speaking generally, they are coarse and ill shaped, but hardy and active. In the southern provinces, however, whence the cavalry horses are brought, the breed is very superior. The khans or chiefs of the nomadic tribes occasionally possess as many as 10,000 horses.

M. Storch states that there is no country in Europe where so many cattle are reared as in Russia, and none where they are taken so little care of. (*Tableau de la Russie*, ii. 155.) Exclusive of the numerous herds, which constitute a principal part of the wealth of the pastoral and nomadic tribes, every peasant has a few head, and even the beggar has a cow or a goat! The ordinary Russian ox is small, lean, and bony; but those of the Ukraine, Podolia, Volhynia, and some other provinces, are large and of a very fine breed. Many thousand head are annually sent from the Ukraine to Petersburg and other Russian towns, and also to Silesia and Germany. Tallow is at present, and has been for some years, the most important article of export from Russia: the increase of the exports of this article from Odessa within these few years has been quite extraordinary. The wool of the common Russian sheep is hard and coarse; but latterly considerable efforts have been made to improve the breed by importing fine woolled sheep from Germany; and wool, notwithstanding the increase of factories at home, is becoming an important article of export. Thus, during the period from 1814 to 1834, the annual average export of wool amounted to only 1,364,000 lbs., whereas, in 1838, it amounted to very near 13,000,000 lbs., valued at 552,000*l*. Hogs are everywhere abundant, and, in the northern provinces especially, furnish a principal part of the food of the people, while, in the south, are an article of export. Goats are also abundant. The rearing and management of bees is more attended to in Russia than in any other European country, and is,

\* One seventh of a man's landed property goes, on his death, to his widow for ever; one fourteenth goes to each daughter; and the residue is equally divided among the sons. (*Vendée's Russia*, 132.)

in fact, the principal occupation of several tribes. The wild bees, however, greatly exceed those that are domesticated. Their culture is principally attended to in the provinces of Kasaan and Ourfa. Individuals among the Bashkirs possess 100 hives in their gardens, and upwards of 1,000 in the forests! (*Storch, Tableau*, li. 349.) Honey is very extensively used in many parts in stead of sugar. The export of wax is very considerable. In 1834, it amounted to 22,248 pounds, or 800,928 lbs.

*Manufactures*—are not generally in an advanced state. Since the reign of Peter the Great, their improvement and extension have, it is true, been favorite objects with the government; and heavy duties and prohibitions have, in consequence, been imposed on such foreign articles as it was supposed might interfere with similar articles of native growth. This, however, was a very erroneous policy. The slavery of the peasantry is an all but invincible obstacle, in so far at least as they are concerned, to the formation of those habits of industry, perseverance, and invention, necessary to insure success in manufactures; while the thinness of the population, the variety of natural products, and the fertility of the soil, all concur in pointing out agriculture, including under that term mines and fisheries, as the natural and most advantageous employment that can be carried on upon a great scale, till civilisation be more generally diffused. In fact, considering the peculiar circumstances under which Russia has been placed, and the deficiency of her capital, the wonder rather ought to be that she has made so great a progress as she has done in manufacturing industry, than that she should still be so backward. Among the peasantry generally, there is little or no subdivision of labour. Each family commonly supplies itself with all the clothing and furniture which it requires. Sometimes, however, a person superadds some particular employment to his ordinary avocations; and sometimes this principle is carried farther, and the inhabs. of entire villages devote themselves to some particular trade. It is only in pretty large towns that the division of labour, such as it exists amongst us, is carried to any considerable extent; and even there it is a common complaint that the native products, though showy, are seldom satisfactory or good. "*Si le génie de l'invention lui manque*," says Schmitzer, "*le Russe possède en revanche, au plus haut degré, la facilité d'imiter ce qu'il a vu d'autrui produire; et un esprit actif et exercé lui fait deviner les procédés qu'il faut suivre. Mais, pressé de gagner, et manquant de persévérance, il travaille à la hâte, plutôt pour l'apparence que pour la durée, et les produits de toute espèce restent toujours infiniment au-dessous des ouvrages exécutés par des mains étrangères.*" (*Tableau de la Russie*, p. 125.) The versatility of the Russian peasant is astonishing. He is truly a Jack of all trades, and will turn his hand to whatever may be required. "He will plough to-day, weave to-morrow, help to build a house the third day, and the fourth, if his master need an extra coachman, he will mount the box, and drive four horses abreast as if it were his daily occupation. None of these operations, except, perhaps, the last, will be as well performed as in a country where the division of labour is more thoroughly understood. They will all, however, be sufficiently well done to *serve the turn*," a favourite phrase in Russia. The people are very ingenious, but perseverance is wanting; and though they carry many arts to a high degree of excellence, they generally stop short of perfection; and it will be very long before their products can come into competition, for finish, durability, or cheapness, with English goods." (*Venables' Russia*, p. 141.)

In certain departments, however, Russia is not merely equal but even superior to other countries. Her leather is excellent; and for some purposes, such as bookbinding, is decidedly superior to any other material. The process followed in the preparation of this important article has been often described; and foreigners have frequently engaged in the business in Russia, with the view of making themselves acquainted with the details, that they might undertake it at home. But, whether it be owing to something in the bark or the water, or to some other undiscovered cause, none of the attempts to produce Russia leather in foreign countries have ever succeeded, and Russia continues to enjoy a monopoly of this valuable product, and to export it in large quantities. The sail-cloth, cordage and canvass, tick, felt, mats, potashes, soap, candles, caviar, isinglass, spirits, and some other articles produced in Russia, are quite as good, or better, than those of any other country.

So late as 1788, almost all the cloth required for the clothing of the army was imported from abroad; but it is now wholly manufactured at home. Cloth of a superior quality is also made at Moscow and its vicinity, at Iamburg, near Petersburg, Sarapta, and other places; but, generally speaking, it is both inferior to what might be imported and dearer. Linen is principally manufactured in Vladimir, Kostroma, Moscow, and Kalouga; and sail-cloth and cordage in Archangel, Orel, &c. The silk manufacture of Moscow is extensive and thriving, and it is carried on to a less extent in other towns. Nu-

merous establishments for the spinning of cotton have been recently founded. Generally, however, they supply only the coarser descriptions of yarn, the finer sorts being almost wholly imported from England. The cotton manufacture has recently made a rapid progress. It is principally carried on in the government of Vladimir; Chouia and Ivanova being its chief seats. In 1828 they had 15,612 looms, and employed 24,257 workpeople. During the same year there were sold in the province 5,610,000 lbs. of foreign cotton yarn, and 660,000 lbs. produced by Russian spinners. (*Schmitzer, La Russie*, &c. p. 105.) The increase has been very great in the interval; for, it appears from the official returns, that there were in Vladimir, in 1830, 315 factories which gave employment to 83,655 workpeople. The glass manufacture has, also, made a very rapid progress. Single plates are made at the Petersburg glass-works, that cost 600*r.* each. The glass-works of the brothers Maltzoff, in Tula and Twer, are deservedly celebrated. The home consumption of glass is great, and is rapidly increasing. The manufacture of snuff and cigars, potash, and soap has, also, very rapidly increased. Paper, coarse and fine earthenware, jewellery, &c., are produced at Moscow, Petersburg, and other places.

Industry of all sorts has made an astonishing progress since the peace of 1815. In 1812 there were, in the entire empire, 2,332 manufacturing establishments, employing 619,093 workpeople; whereas, in 1836, the former amounted to 6,015, and the latter to 269,673, of whom about a half were free labourers. During the next three years the progress was still greater, there being, in 1839, 1,855 manufactories, employing 412,331 workpeople, exclusive of those engaged in mines, smelting-houses, furnaces, &c. In 1837, the total value of the manufactured produce of Russia was estimated at 509,574,397 roubles, and it is now (1841) probably not under 650 millions. Among the different manufacturing establishments, in 1839, 616 were appropriated to the production of woollens, 227 to that of silk, 467 to that of cotton, and 267 to that of linen.

The progress of industry is strikingly evinced by the fact that while, in 1820, there were only two steam-engines in the government of Moscow, it reckoned about 160 in 1839! The same government had, in 1839, 1,058 factories, and 83,654 workpeople.

With the exception of the formidable restraints originating in the slavery of the peasantry, industry is quite free in Russia. There are no internal monopolies, save those of salt, spirits, and playing cards. There is nothing in the guilds, or corporations, to check competition; and all who are free may exercise any art or profession, either in town or country, as may be most agreeable to themselves. Slaves who have obtained a passport, or license from their owners to leave their estates, are, in this respect, in the same situation. Since 1836, lectures have been instituted in all the Russian universities, for the instruction of manufacturers or handicraft-tradesmen in mechanics, chemistry, &c., and in the application of science to practice.

*Commerce*.—The commerce of Russia is already, notwithstanding the paralyzing influence of the prohibitive system, very extensive; and will, no doubt, continue to increase with the growing wealth and population of the empire, and according as more liberal principles may be expected to prevail. The principal articles of export are tallow, which is more largely exported from this than from any other country; grain, particularly wheat & hemp and flax; timber, potashes, bristles, linseed and hempen seed, linseed and hempen oils, furs, leather; fox, hare, and squirrel skins; canvass and coarse linen, cordage, wool, caviar, wax, isinglass, tar, &c. The principal imports are sugar, especially from the Havannah; cotton stuffs and yarn, the latter being by far the most important article sent from Great Britain to Russia; coffee, but not in large quantities; indigo, and other dye-stuffs; woollens, oils, spices, wine, salt, tea, lead, tin, coal, fine linen from Holland and Silesia, &c.

The principal trading ports are Petersburg and Riga, on the Baltic, but particularly the former; Archangel, on the White Sea; Odessa, on the Black Sea; Taganrog, on the sea of Azof; and Astrakhan and Baku, on the Caspian Sea. Moscow is the principal entrepôt of the interior commerce of the empire. The trade with China is mostly carried on through Kiachta; and the fair of Nijni Novgorod is celebrated all over Europe. There are also very large fairs at Irbit, Kharkoff, Koursk, and other towns. (*See these towns*.) The value of the goods offered for sale at the different great fairs, in 1839, is said to have amounted to 353,894,722 roubles. In 1839 the total value of the exports from the empire to foreign countries was estimated at 332,002,258 roubles (13,833,000*l.*); of which those from Petersburg amounted to nearly a half, or to 136,446,000 roubles. At an average of the six years ending with 1838, the real value of the articles of British produce and manufacture exported from this country to Russia amounted to 1,686,301*l.* a year, cotton-twist constituting three-fourths of their total value.

ACCOUNT of the Quantities of the principal Articles of Russian Produce and Manufacture imported into the United Kingdom from Russia in 1839.

Articles.	Quantities.	Articles.	Quantities.

**Water Communications.**—The great road from Petersburg to Moscow is justly said by Lord Londonderry to be a most magnificent public work. It is nearly 500 m. in length, quite level, about double the width of the Great North Road in England, and is macadamised throughout, and kept along the whole line in the most perfect repair. *Tour*, l. 141.) But, with the exception of this and of a few other principal lines, there is a great want of good roads in Russia. This, however, is productive of less inconvenience than might be expected, from the circumstance of the frost rendering the worst roads fit for sledge travelling for a considerable period of the year; and from the number of navigable rivers and the extension that has been given to their navigation by the construction of numerous canals. By these means a water communication has been effected between the great navigable river the Wolga, which has its embouchure in the Caspian Sea, and Petersburg and Archangel: the Wolga has also been united with the Don, which falls into the sea of Azoff. The Pripet, an affluent of the Dniepr, which falls into the Black Sea, has been connected with the Bug, an affluent of the Vistula, while the latter has been connected with the Niemen.

Few countries, in fact, have so extensive a command of internal navigation. Goods put on board in Petersburg may be conveyed to Astrakhan, a distance of above 1,400 m., or to any port on the Caspian, and *vice versa*, without once being landed. The iron and furs of Siberia and the teas of China are received at Petersburg in the same way; but owing to the great distance of these countries, and the short period of the year during which the rivers and canals are navigable, they sometimes take three years in their transit! Immense quantities of goods are conveyed during winter upon the ice in sledges, to the different ports, and to the nearest *pristans*, or places in the interior, where barks are built for river or canal navigation. They are put on board in anticipation of the period of sailing, that the barks may be ready to take advantage of the high water, by floating down with the current as soon as the snow and ice begin to melt. The cargoes carried up the river into the interior during summer are principally conveyed to their ultimate destinations by the sledge roads during winter. The conveyance by the latter is generally the most expeditious; and it, as well as the internal conveyance by water, is performed at a very moderate expense.

The barks that come from the interior are mostly of a very rude construction, flat-bottomed, and seldom drawing more than 20 or 30 inches water. When they arrive at their destination, they are sold or broken up for firewood. Those that leave the ports for the interior are of a superior description, and are comparatively few in number: the commodities imported being, at an average, of much greater value, relatively to their bulk and weight, than those that are exported.

As illustrative of the importance of the inland navigation of the empire, we may mention that, in 1839, no fewer than 46,850 boats and 17,469 rafts arrived from the interior at the different great ports and emporiums of the Russian empire, the goods so conveyed being worth 538,921,730 roubles. Of these, 22,842 boats and 781 rafts, value 156,574,901 roubles, arrived at Petersburg; 1,362 boats and 1,235 rafts, value 15,281,500, at Archangel; 1,365 boats and 1,373 rafts, value 32,437,378, at Riga, and so on.

Accounts in Russia are kept in roubles and kopeks; but the rouble is of two kinds, very different in value. The silver rouble is worth from 3s. 2d. to nearly 4s. Engl., varying according to the distance from the capital. The paper rouble, worth about 10d. Engl., and usually considered equivalent to a franc, is the basis of all mercantile calculations, and is divided into 100 kopeks. The kopek, worth consequently about a centime, is a copper coin. The only gold coin is the demi-imperial, value about 20 fr. Since 1828, platinum coins, worth about 12 sterling, have been struck; but they are not yet of any practical importance. The Russian lb. is rather larger than the avoirdupois lb.; the last = 13·8 quarters; the

*chetvert*, the measure for corn, = 5·75 Eng. bushels; the *deciatine*, land measure = about 2·7 acres; the verst of 104·5 to a Geog. degree = 1,167 yards, 3 versts being about equivalent to 2 Eng. miles.

**Native and Foreign Merchants, &c.**—Every Russian carrying on trade must be a burgher, and have his name registered in the burgher's book; he thus acquires an unlimited freedom of trade. All whose names are in the burgher's books are either townsmen who have property within the city, or members of a guild. There are three guilds. Those belonging to the first report themselves to possess from 10,000 to 50,000 roubles: these may follow foreign trade, are not liable to corporeal punishment, and may drive about the city in a carriage drawn by two horses. Those belonging to the second guild declare themselves possessed of from 5,000 to 10,000 roubles: they are confined to inland trade. A capital of from 1,000 to 5,000 roubles entitles its owner to admission into the third guild, which comprises shopkeepers and petty dealers. The rates paid by the members of these guilds amount to 12 per cent. upon their declared capital, the statement of which is left to the conscience of every individual. Burghers are not obliged to serve in the army, but may provide substitutes, or pay a fine. The *guests*, or foreign merchants who enrol themselves in the city, register on account of their commercial affairs, enjoy privileges nearly similar to those enjoyed by the members of the first guild.

Slaves but native Russians are allowed to engage in the internal trade of the country; and hence a foreigner, who imports goods into Russia, must sell them to Russians only, and at the port where they arrive. A few foreigners, indeed, settled in Russia, and having connections with the natives, trade with the interior: but it is contrary to law, and the goods are liable to be seized. In 1836, the merchants of the three guilds amounted, in all, to 128,854 individuals.

The merchants engaged in foreign trade are mostly foreigners, of whom the English are the principal. The peculiar privileges formerly enjoyed by the latter are now nearly obsolete, and their rights, in common with those of other foreigners, are merely those of *guests*. The English factory at Petersburg is, at present, little else than a society formed of some of the principal English merchants, several of whom, however, do not belong to it: its power extends to little else than the management of certain funds under its control.

Owing to the scarcity of capital in Russia, goods, the produce of the country, are frequently paid in advance; and foreign goods are most commonly sold upon credit. From the month of November to the shipping season in May, the Russians who trade in flax, hemp, tallow, bristles, iron, &c., either come themselves to Petersburg or Riga, or employ agents to sell their goods to foreigners, to be delivered, according to agreement, in May, June, July, or August. The payments are made according to the circumstances of the sellers and buyers; sometimes the buyer pays the whole amount, in the winter months, for the goods which are to be delivered in the summer or autumn; and sometimes he pays a part on concluding the contract, and the residue on delivery of the goods. The manufacturers and dealers in them usually come to Petersburg in March, and sell their goods for ready money.

Foreign goods were formerly almost entirely sold at a twelve-month's credit, and some at a still longer term; but of late years several articles, as coffee and sugar, are sold for ready money; still, however, the great bulk of foreign goods for the supply of the interior is sold on credit. Most of the Russians who buy goods on credit of foreigners, for the use of the interior, have no other connection or trade with Petersburg than merely coming there once or twice a year to make purchases; which, having accomplished, they set off with the goods, and the foreigner neither sees nor hears of them again till the bills become due. It is obvious, from this statement, that experience and sagacity are nowhere more requisite in a merchant than here. He has nothing, in fact, but his own knowledge of the native dealers to depend upon; and it is highly creditable to the Russians, that foreigners do not hesitate to trust them with immense sums on such guarantee.

**Governments.**—In Russia all power emanates from the sovereign, whose authority is uncontrolled, except by the respect he may yield to established customs, to the privileges of certain classes, and the prejudices of the people. The will of the monarch has no legal limits, so that he may be said to be absolute. The act of election of 1613, which conferred the crown on the house of Romanof, recognises the unlimited power of the sovereign. The empress Catherine and the emperor Alexander laboured to give order, simplicity, and regularity to the administration, and to reduce it to a system, so that it might be as independent as possible of the caprices of the sovereign. Alexander, indeed, proclaimed in 1811 that the law was in Russia superior to the sovereign, and gave to the senate the right of remonstrating against

any *ukase* (as an Imperial decree is called) they thought contrary thereto. This, no doubt, seeing the way in which the senate is composed, is a very feeble check on the despotic power of the emperor. But it may well be doubted, whether, in the actual state of Russia, the present form of government be not better adapted to its wants than any that could be substituted in its stead. It is sufficiently clear, as well from general principles as from what has actually occurred, that Russian princes cannot safely follow a course of conduct generally disliked by the nation. On the other hand, however, the extent and unity of the sovereign power is the best security for the progress of civilisation, and for the improvement and well-being of the mass of the people. The latter being, for the most part, slaves, without property, intelligence, or influence, would be tyrannised over to an incomparably greater extent than at present, had the nobles any share in the government, or were they able to control its proceedings. What Poland was Russia would be, were the nobility or superior classes participating in the sovereign power. But the interests of the monarch and those of the mass of the people are generally identical. Under his protecting and civilising rule daily extending, and a class of free labourers is gradually growing up. The emperor is afraid of the nobles, not a few of whom are supposed to be tainted with liberal opinions; but he has nothing to fear from their slaves. Hence the despotic power of the former over the latter has been materially reduced; very great changes for the better have been made in the condition of the peasantry on the crown estates; and the government has gone steadily on, with quite as much rapidity as circumstances would warrant, endeavouring to improve and advance the servile portion, that is, the great mass, of its subjects, and to pave the way for their ultimate emancipation. An enlightened despotism is, in fact, the most suitable government for such a country as Russia. A representative constitution would merely put additional power into the hands of a comparatively small class, and would be as little adapted to the wants of such a country as an absolute government would be to England.

The monarch is the central point of the administration: his decisions are law. Every thing emanates from him in the first instance, and every thing is referred to him in the last. The labour he has to undergo is great, and requires incessant activity.

The public business is transacted, under the emperor, by different boards, councils, or colleges, which have each separate, but sometimes not easily distinguished functions. The *Imperial Council of the Emperor* was established, on its present footing, in 1801. It consists of a president, and an indefinite number of members, of which the ministers always make a part. It is divided into the five departments of legislation, war, civil and religious affairs, finance, and the affairs of Poland; and has the superintendence of all matters connected with the internal administration of the empire. The second college, or senate, was founded by Peter the Great in 1711, and is reckoned the most important body in the state. It has various functions, partly of a deliberative and partly of an executive character, set forth in a *ukase* of 20th Sept. 1802. It is the high court of justice for the empire, and controls all the inferior tribunals. The members are nominated by the emperor; at present their number is about 100, and each receives a salary of 7,000 roubles a year. The senate is divided into eight committees or sections, of which five sit at Petersburg, and three at Moscow. Each committee is authorised to decide in the last resort upon certain descriptions of cases, brought either immediately before it, or by appeal from the inferior courts. In a few cases, however, parties dissatisfied with its decisions may petition the emperor. The senators are mostly persons of high rank, or who fill high stations; but a lawyer of eminence presides over each department, who represents the emperor, and without whose signature its decisions would have no force. In the *plenium*, or general meeting of the sections, the minister of justice takes the chair, as high procurator for his majesty. Besides its superintendence over the court of law, the senate examines into the state of the public revenue and expenditure, and has power to inquire into public abuses, to appoint to a great variety of offices, and to make remonstrances to the emperor. Monthly reports of its proceedings are published in the gazette.

The third college consists of the *Holy Synod*, and to it is committed the superintendence of the religious affairs of the empire. It is composed of the principal dignitaries of the church. All its decisions run in the emperor's name, and have no force till approved by him. The fourth college consists of the *Committee of Ministers*, of whom there are eleven, viz. the ministers of the imperial household, of war, finance, justice, interior, public instruction, imperial domains, post-office, roads and public buildings, and the vice-chancellor and comptroller-general. The ministers have frequently colleagues who supply their place when they are either

sick or absent. They communicate directly with the emperor, or with his *Chancellerie particulière*, in whose hands all the executive authority is centred.

The local administration differs in different provinces; government having always allowed conquered or annexed countries to preserve their own laws and institutions, except in so far as they were hostile to the general constitution of the empire. Finland, for example, has a special form of government; and the provinces wrested from Sweden by Peter the Great, Courland, and those formerly belonging to Poland, have peculiar institutions and privileges, which, however, have latterly been much modified. But, despite these exceptions, the form of the provincial government is, notwithstanding, sufficiently uniform.

The empire is divided into general governments, or vice-royalties, governments, and districts. There are, at present, 14 of the first, 50 or 51 of the second, and above 320 of the last. There are also, as already stated, extensive districts which, from the thinness of the population, otherwise, are not organised into regular governments, which are called *provinces*, or *oblasts*. The viceroys, or general-governors, are the representatives of the emperor; and as such command the forces, and have the supreme control and direction of all affairs, whether civil or military. All the functionaries within their jurisdiction are subordinate to, and make their reports to them. They sanction or suspend the judgments of the courts, &c. A civil governor, representing the general governor, assisted by a council of regency, to which all measures must be submitted, is established in each government or province. In case of dissent, the opinion of the governor is provisionally adopted till the pleasure of the emperor with respect to the matter be ascertained. A vice-governor is appointed to fill the place of the civil-governor when the latter is absent or unwell. There are also, in every government, a council of finance under the presidency of the vice-governor, who manage the crown estates, and superintend the collection of the revenue; a college of general provision, which has the direction and inspection of all charitable foundations, prisons, workhouses, schools for the instruction of the poor, &c.; and a college of medicine, which attends to all matters connected with the public health, appoints district physicians, inspects pharmacopœias, &c. The districts have each their local functionaries. The towns have a municipal body, elected once every three years by the different classes into which the free pop. is divided. And each town has, also, according to its importance, a commandant or bailiff, appointed by the crown, who has charge of the police, of the public buildings and magazines, and who executes sentences, pursues criminals, &c.

The Russian judicial system is complicated, and not easily understood, except by natives. There are civil and criminal courts in every circle; and a supreme court of justice, divided into civil and criminal sections, is established in every government. Cases decided in the inferior courts may be appealed to it. Its sentence is final in all criminal cases, and in all civil matters relating to sums under 500 roubles. Those involving property to a greater amount may be carried before the senate.

It is a curious fact that, notwithstanding the despotic nature of the government, all the provincial tribunals consist partly of elective functionaries. Thus, the superior court for a circle consists of a judge and secretary, and of two assessors chosen annually by the nobles, and two by the peasants; and the superior court of justice for a government, which is divided into a civil and a criminal chamber, consists of a president, secretary, and 4 assessors for each chamber; 2 of the assessors being chosen by the nobility, and 2 by the burghers. It is, in fact, a principle in Russia, that a portion of the judges in every court should belong to the same class as the party whose interests are under discussion, and be elected for that purpose by his peers. In the case of the nobility and burghers, this is a most valuable privilege; but in the case of the peasantry, who stand most in need of protection, this privilege is quite illusory; their slavery and ignorance making them utterly incapable of profiting by it.

Previously to the reign of the Empress Catherine II., the judges, particularly in the inferior courts, were wretchedly paid. That princess increased their salaries; but they are still far too low. And seeing that the judges are removable at pleasure, and owe their situation to favour rather than to merit, we need not wonder that the greatest abuses continue to exist in the administration of justice. The proceedings are dilatory in the extreme. The prohibition against taking fees from suitors is rarely complied with; and in most tribunals it is affirmed, that if justice cannot be altogether defeated, it may at least be indefinitely postponed, by dint of money. These abuses have, however, been, in part, at least, obviated by the publication, between 1826 and 1833, by the Legislative Commission, of an extensive digest (*Sveod Zakonov*, "Body

of Law") of all the laws then in force relative to the rights of citizens and the administration of public justice. This publication has greatly simplified the law; and it is of vast importance from its being, as it were, a charter of rights which may be appealed to on all future occasions, and which it will be very difficult for any succeeding sovereign to abridge. But it would, notwithstanding, be idle to expect any very material improvement in the ordinary administration of justice, until the judges be better trained, selected, and paid; and till the influence of public opinion, and of a comparatively free press, neither of which has at present any existence in Russia, be brought to bear on the administration of justice, and of public affairs generally. The latter, in fact, is the only security against abuse on which any reliance can safely be placed. Wherever judges are exempted from the control of public opinion, and the animadversion of the press, they are most commonly the obsequious instruments of government, and seldom scruple to commit injustice when they believe it will be acceptable to their superiors.

There is in Russia, particularly in the great towns, a very efficient system of police. The officers are empowered to discharge various functions besides those which come more peculiarly within their province; such as the decision of differences between masters and servants, &c. Crime is not frequent in Russia; and property is as well protected in it as in any other country. Houses being generally built of wood, fires in great towns are apt to be very destructive; and the most effectual precautions are taken to prevent their occurrence. All strangers arriving in Russia must produce their passports at the police office, and notify their arrival in the public papers.

**Punishments.**—Capital punishments are rare in Russia, treason being the only crime visited with death. In cases of murder, fire-raising, and other capital offences, the criminal, after receiving a certain number of lashes from the knout (a heavy thong whip), under the infliction of which his senses expire, is condemned for life to forced labour in the mines of Siberia. This part of the legislation of Russia has been the theme of much, though, as it appears to us, of little deserved eulogy. We agree with Mr. Cox, that the fear of death is to most men the most efficient check on the commission of crime; and though it were conceded that Russian malefactors undergo a much severer punishment, still, as people generally know nothing of it, it makes no impression on them, and has little or no influence in deterring others from committing similar offences. (See *Cox's Travels in Russia*, &c. iii. 116.) The nostrils of criminals used also to be slit, and their face branded with a red-hot iron previously to their banishment to Siberia; but this needless aggravation of punishment was put an end to by the Emperor Alexander.

Torture was formerly universal in Russia, and was inflicted at the discretion of the superior justices in all parts of the country, by whom, as was to be expected, the power was often shamefully abused. Russia is indebted to the Empress Catherine for the abolition of this atrocious practice. And it is a singular fact, and worthy of the attention of those who are so fond of recommending immediate changes, that the prejudice of the Russians, in regard to the necessity of torture, was so deeply rooted that Catherine had to proceed with great caution in bringing about its abolition, which was effected rather by indirect than by direct means. (*Cox, ubi supra.*)

According to an official return there were, on the 1st of Jan., 1835, 97,121 criminals in Siberia, of whom 23,264 were females. Of the convicts, about 10,000 are condemned to forced labour in the mines, and otherwise; the others being mostly employed in agriculture. The greatest criminals, or (according to the interpretation of the Russian government), those sent thither for political offences, are mostly confined in N.E. Siberia, the climate of which is especially severe. The desertions amount to about 2,000 a year.

**Division of the People into Classes.**—The people of Russia are divided into four classes, viz. 1. nobles, 2. clergy, 3. burghers, merchants, and other farmers, and 4. the peasants, or slaves.

1. **Nobles.**—Previously to the reign of Peter the Great, the Russian nobility consisted principally of the descendants of the ancient petty princes of the country, or of lords possessed of vast estates. They were in the exclusive possession of all situations of trust and emolument, to which they succeeded according to their rank. Peter, who early saw the disadvantage of this state of things, and the necessity of undermining the influence of the nobles, most of whom were violently opposed to his projects for the regeneration of the country, had recourse, in furtherance of his plans, to the scheme of creating a new order of nobility. In this view he divided all the civil and military functionaries in the service of the state into 14 classes, enacting, at the same time, that the 8 highest

classes should confer the distinction of personal nobility, or of nobility for life; and that those enrolled in the others should be deemed gentlemen, or *hien nés*. Some modifications were made in this arrangement by the Empress Catherine II.; but it is still maintained nearly as it was contrived by Peter the Great.

The creation of a new nobility founded on merit, or on services rendered to the state, was, no doubt, a material improvement at the time. By illustrating many new families, it has served to lessen the influence of the old nobility, and to liberalise the order, at the same time that it has opened a prospect to all enterprising individuals of rising to the highest dignities. On the whole, however, it would seem that the system having served its purpose, might now be advantageously abandoned. "*En grossissant,"* says M. Schmitzler, "*à l'infinité, le corps de la noblesse, ne doit-il pas à cette institution pratique nécessaire; et en dépassant le tiers état de tout ce qu'il a des citoyens distingués, n'affaiblir-il pas la considération dont il se voit justifié d'entourer la classe laborieuse? N'aurait-il pas à jamais occis l'art et l'industrie des hommes capables, qui auraient contribué à leurs succès, s'ils n'avaient pas eu à soutenir un rôle nouveau, et qu'ils ne craignissent de déroger à un rang auquel des longs efforts et les travaux de leurs pères les ont enfin élevés, en se voyant à des occupations qu'on regarde comme roturières?" (*Statistique Générale*, p. 241.)*

According to the official accounts, the order of the nobility comprised, in 1836, 691,355 individuals, of whom 538,166 enjoyed hereditary and the others personal dignities. In Russia, properly so called, the nobles are not numerous; but they abound in Podolia, Volhynia, and other provinces acquired from Poland, and especially in Poland itself, which, in 1837, had 243,420 nobles! Few, however, of the latter possess estates, and many of them are in a very destitute condition. In the Polish provinces, and in Prussia, Livonia, and Esthonia, none but nobles can inherit landed property; but this is not the case in Russia Proper, though, with the exception of the crown estates, they are, in fact, almost the sole proprietors. The titles of prince, count, and baron have superseded those formerly in use. In the government of Tula, there are said to be more than 100 families having the dignity of prince. All the members of noble families are noble, and have the same title as the head of the family. On the death of a noble person, his estate is divided, according to a fixed scale, (see *ante*, p. 610.), among his children of both sexes. Nobles are exempted from all personal charges, and from the obligation to serve in the army, but they are obliged to furnish recruits according to the number of their vassals. Nobles are also exempted from corporal punishment; have leave to distill all the spirits required for the consumption of their establishments; may engage in manufactures or trade; have a right to all the minerals on their estates, &c. Precedence is determined, in Russia, by military rank; and an ensign would take the place of a nobleman not enrolled in the army, or occupying some situation giving military rank. (*Schmitzler, Essai d'une Statistique*, &c., p. 112, &c.)

The property of a noble who has been condemned is not confiscated by the state, but goes to his family. The nobles also elect various local magistrates, assessors, &c., and deliberate at their meetings on various matters connected with the local administration. There is also in every government a committee of nobles to watch over the interests of the body, and to take care of the establishments that belong to it; and every circle has a committee of nobles who manage the estates and affairs of nobles who are under age. These privileges, which are obviously of considerable importance, were embodied and set forth in a ukase in 1762; and another ukase of the Emperor Alexander prohibits all government functionaries from interfering with the election of the assessors, and other functionaries chosen by the nobles.

It is not easy to form a fair estimate of the character of the Russian nobles. Generally speaking, their education is more superficial than solid; but many are, nevertheless, highly accomplished; they are all well acquainted with French, and numbers with the English and German languages; those who have travelled being distinguished by the superior polish and elegance of their manners. They are universally hospitable; and most of them affect, and many relish, the society of literary men and artists. That they are more sensual, more given to ostentatious display, and less distinguished by a gentlemanly bearing towards their inferiors, than the higher classes in England or France, is, no doubt, true. But the representations of their manners and conduct, given by Clarke, Lyall, and other travellers, of their caste, are, notwithstanding, mere vulgar caricatures, which though they may, perhaps, apply to a few individuals, are generally quite as wide of the truth as M. Pillec's accounts of our fair countrywomen. Considering, indeed, that the

that in most parts of the empire there is no middle class, and that the occupiers of their estates are not freemen but slaves, the wonder is not that their tastes and habits should be, in some respects, barbarous, but that they should have made so great an advance as they have done since the reign of Peter the Great, and that they should be so intelligent and refined as they are found to be.

The Russian nobles, like those of England and other countries in feudal times, are in the habit of keeping great numbers of vassals in their houses as servants. The number of such retainers in some great families exceeds all belief, amounting sometimes to above 500! They receive only a trifling pittance as wages, but that is quite enough for their wants, as they are fed and clothed by their masters. Several Russian noblemen have recently distinguished themselves by their attention to their estates, and by the efforts they have made to introduce the improved processes and implements in use in more advanced countries. In some instances they have brought land stewards and labourers from England. Latterly, also, many of the principal nobles have become extensive manufacturers, and some of the greatest manufacturing establishments of the empire are, at present, in their hands. They are driven, in fact, to adopt this course by the circumstances under which they are placed. All agricultural, and most out-of-doors employments being suspended during winter, the noblemen, who must provide for the subsistence of their slaves, whether the latter be employed or not, naturally endeavour to avail themselves of their services during the interruption of husbandry pursuits, by setting on foot some species of manufacture. The latter, indeed, is frequently carried on only during winter, the peasants being employed in agriculture during the rest of the year. When, however, a nobleman establishes a manufacture on a large scale, and keeps it constantly at work, the peasants are usually put on the footing of hired labourers, and instead of getting an allotment of land, are paid for their work, and left to supply themselves with necessaries. Some manufactures conducted in this way have been eminently successful; though it be hardly necessary to add, that if they be of the higher class, or require any peculiar skill, economy, or attention, they are not of a kind that can be successfully carried on by the agents of noblemen; and that the moment the protection afforded by oppressive custom-house duties, under which they have grown up, is withdrawn, they will straightway fall to the ground. (See *Fenables' Russia*, &c., p. 140.)

Mr. Cox and Dr. Pinkerton, among the best and most trustworthy of the English travellers who have visited Russia, speak very favourably of the Russian nobility. The former says, that though they have adopted the delicacies of French cookery, they neither affect to despise their native dishes, nor sensibly reject the solid joints which characterise an English roast. "The plainest as well as the choicest viands are collected from the most distant quarters. At the tables of opulent persons in Petersburg may be seen sturgeon from the Volga, veal from Archangel, mutton from Astrakhan, beef from the Ukraine, and pheasants from Hungary and Bohemia. The common wines are claret, Burgundy, and champagne; and English beer and porter may be had in perfection and abundance. It is usual to take a whet before dinner; but the stories engrafted upon this practice, of the prevalence of inebriety among the higher classes, are wholly without foundation. In this respect their habits have undergone a total change since the days of Peter the Great; and they are now remarkable for sobriety. The peasantry, however, often indulge to excess in their potations. (*Cox*, ii. 151.)

The lengthened stay of the Russian armies in the western and more civilised European states, after the defeat of Napoleon's invasion, made a large number of the nobles, and of the more intelligent classes (which in Russia consist of the military officers), familiarly acquainted with a more advanced state of society, and a better form of civil polity. This circumstance, also, gave an increased stimulus to the desire for travelling that previously prevailed among the nobility, many of whom withdrew to France, England, and Italy. It is not to be denied, that the influence of these concurring circumstances has since, on various occasions, made itself sensibly felt in Russia; and that the government has sometimes had reason to believe that a considerable portion of the nobility, and even some of the most distinguished regiments, would not be displeased to see some limits set to the powers of the czar. To counteract this feeling, various obstacles have latterly been opposed to the emigration of Russian nobles and to their residence abroad: the most vigilant measures have also been adopted to hinder the employment of foreign tutors and governesses; and to prevent the introduction of foreign works not approved by the censor. It remains to be seen whether these measures will be effectual to maintain the present order of things; but, at all events, it is sufficiently clear, from what has been already seen, that, under existing circumstances, such a revolution in Russia

as should materially modify the power of the czar, would not be for the advantage of the bulk of the people, but the reverse.

2. *Clergy*.—This body will be more fully noticed under the head Religion. It comprises, in all, about 274,000 individuals, of whom about 254,000 belong to the Established Church. Including the wives of the priests, it is supposed that about 540,000 persons may belong to this class. They are exempted from all direct taxes, and from corporal punishment, and may acquire all sorts of fixed property.

3. *Merchants, Burghers, &c.*—This comprises the class intermediate between nobles and peasants, and is thus alluded to by the empress Catherine in her instructions for a new code of laws:—"This class, composed of freemen, belongs neither to the class of nobles nor to that of peasants. All those who, being neither gentlemen nor peasants, follow the arts and sciences, navigation, commerce, or exercise trades, are to be ranked in this class. In it should be placed all those who, born of plebeian parents, shall have been brought up in schools or places of education, religious or otherwise, founded by us or by our predecessors. Also the children of officers and of the secretaries to the chancery," &c. Merchants and traders belong to this class; and they, as already stated, are distributed into their guilds according to the amount of capital they respectively possess (see *ante*), and enjoy various privileges on their paying a certain percentage on their declared capital. The burghers, or second division of this class, possess many privileges superior to the peasants; but they are distinguished from the merchants by being subject to the capitation tax and to enrolment in the army and navy. The Germans and other free colonists established in different parts of the empire, and the free cultivators and tenants found in certain districts, belong to this intermediate class. This class comprises about three millions of individuals.

4. *Peasants*.—Unhappily, however, the far largest portion of the people of Russia are slaves belonging either to the crown or to individuals; above 21 millions being the property of the former, and 23 millions of the latter. Count Cherenietief is proprietor of above 110,000 slaves, and the numbers of those belonging to some of the other great landholders are but little inferior. The nobles are obliged to pay a tax to government (at the rate eventually of about 4 roubles per male), and to furnish recruits to the army according to the slave population of their estates. The time and labour of the slaves belonging to private individuals are absolutely at the disposal of their masters, who may seize whatever property they may happen to acquire. The most common practice is for the latter to impose on their peasants an obrok or capitation tax, which may amount, at an average, for those resident in the country, to from 35 to 45 roubles per male, young and old; but those who have learned any profession, or have been successful, are charged far greater sums, sometimes even as much as 1,000 roubles a year or upwards! Others, instead of an obrok, perform task-work; others, again, deliver a certain portion of their produce; and from some all these are demanded. Run-away slaves are punished by imprisonment and hard labour.

Besides having power to dispose of his time and labour, the master may inflict corporal punishment on his slave; but he is forbidden by law (which, however, is often evaded) from treating him with any great cruelty, and he is guilty of a capital offence if death arise from his chastisement within 24 hours. When one class may exercise such power over another, very great abuses cannot fail to exist. The insecurity, too, under which the peasants are placed, is necessarily fatal to their industry. Oppression and ill-treatment are now, however, a good deal less common than formerly; and it is certainly true that the condition of the boors is by no means so bad as might, *a priori*, be concluded, and that, as respects their command over the necessities of life, they are in a much better situation than the peasantry of Ireland. Those on the estates of humane and enlightened landlords are in decidedly comfortable circumstances; while they mostly all have sufficient supplies of the articles they consider necessary to existence. Some licensed slaves have accumulated very large fortunes. One of this class of persons is mentioned as having 4,000 labourers in his employment; and another planned and built the finest church in Petersburg.

The peasants are of a sound constitution, stout and firmly built, and generally of a middle stature. They live in wooden cottages, formed of whole trees piled upon each other, and built together in villages, the gables to the road. Sometimes they consist of two stories, but more frequently only of one. They are heated by stoves, and though dirty, are not uncomfortable nor ill suited to the climate. Their furniture consists generally of wooden articles, with a pan or two. Beds are little used, the family generally sleeping on the ground, on benches, or on the stove.

The dress of the peasant consists of a long coarse druggot coat, fastened by a belt round the waist, but in winter they wear a sheep-skin with the woolly side inwards. Their trowsers are of coarse linen; instead of stockings, woollen or flannel cloth is wrapped round the legs, and boots or shoes of matted linden bark are frequently substituted for those of leather. The neck, even in winter, is bare\*, and the head is covered by a peaked round hat or cap. (*Voyage de deux Français dans le Nord de l'Europe*, tom. iv. p. 323.)

The Russian peasant considers himself well fed if he have rye-bread, which is the staple article of food throughout the empire, and sour cabbage soup, with a lump of fat, or hogs'-lard, boiled in it, by way of relish. He uses butchers' meat on holidays, and at other times eggs, salt-fish, bacon, lard, and mushrooms, which, at the proper season, are extremely abundant, onions, &c. His favourite dish is a hodge-podge of salt or fresh meat, groats, and rye-flour, highly seasoned with onions and garlic. Salted cucumbers are a constant dish at the peasant's table all the year round. These and salted cabbages form an important article of national commerce. They are brought in large rats from the southern provinces, where the climate favours their production, to Moscow, Petersburg, and other large towns, and here they are constantly on sale in the public markets. The preparation, in autumn, of a sufficient supply of these pickled vegetables forming, in every family, an important part of domestic economy. This dependence of the Russian peasant on vegetable diet is, no doubt, a consequence of the extraordinary number of fasts and fast-days, of which he is a careful observer, and which are multiplied to such an absurd extreme, that it is said there are only from 10 to 70 days in the year on which it is permitted to use butchers' meat. *Quas*, a fermented liquor, made by pouring boiling water on rye or barley-meal, is the common beverage of the peasant. But he is also very fond of mead, and still more so of corn brandy, and other spirituous liquors. The consumption of the latter is immense, exceeding 80,000,000 gallons a year, and furnishing annually a large revenue to government. The use of tea is becoming more and more extended. A substitute for it, called *izbitzen*, consisting of herbs, honey, &c. boiled together, is also extensively used by the peasantry.

The peasants are exceedingly superstitious. A vessel of holy water hangs from the ceiling of every room, and a lamp lighted on particular occasions. Every house is provided with a sacred corner, supplied with one or more pictures of their tutelary saints, coarsely daubed on wood, frequently resembling rather a Calmuck idol than a human head; but sometimes they are of a better quality, and neatly framed. To these they pay the highest marks of veneration. All the members of the family, the moment they rise in the morning, and before they retire to sleep in the evening, never omit their adoration to the saints: they cross themselves during several minutes, upon the sides and forehead, bow very low, and sometimes even prostrate themselves on the ground. Every person, also, on entering the room, pays his obeisance to these objects of worship previously to his addressing himself to the family.

The Russian peasantry have the vices incident to their situation. With a great capacity of endurance, and the most extraordinary talent for instruction, they have but little active vigour or steadiness of purpose. In accosting a person of consequence, or from whom they expect any favour or advantage, they prostrate themselves, touch the ground with their hands, and kiss the fringe of his garments. Their insecure position makes them anxious to enjoy the present moment; and their masters being obliged to provide for their support when they become old and infirm, they have little motive to providence or forethought. As they are accustomed to money, they most frequently bury it in the ground; a practice common to all countries where property is insecure.

The peasantry belonging to the richer nobles are, speaking generally, in all respects, much better off than those who belong to the class of poor and petty nobles; and, unfortunately for the peasants, the number of the latter is rapidly increasing by the subdivision of estates in every successive generation, and the constant augmentation of the nobility, from the influx into its ranks of individuals in the civil and military service. In 1822, however, the evil resulting to the peasantry from this state of things was partially obviated by restricting the right to purchase slaves to nobles possessed of a certain amount of property.

Previously to the reign of Peter the Great, it was customary for the Russians, of all ranks, to marry their children very early, even before the age of puberty. Though restrained by Peter and Catherine II., this custom of early marriage still prevails, and is said to be fraught with many pernicious consequences. A ukase issued in

1801, prohibits priests from solemnizing marriages, unless the man be 18 and the woman 16 years old.

The use of the vapour bath is universal in Russia, not being reckoned a luxury but a necessary; and public baths are met with in all parts of the country. They are resorted to by the peasantry, at least, once a week. Though the baths are highly heated, the bathers not unfrequently run out and in summer plunge into cold water, or, if it be winter, roll themselves in the snow! This sudden alternation of temperature is not found to be injurious to health. But, notwithstanding the frequent use of the bath, the boors are very deficient in cleanliness. (See *Coez*, 5th ed. i. 269.; *Schnitzler, Essai d'une Statistique Générale*, passim.; *Voyage de deux Français au Nord de l'Europe*, iv. 318-332.; *Pinker-ton's Russia*, pp. 69-80, &c.; *Foreign Communications on the Poor Laws*, p. 330, &c.)

**Army.**—The military power of Russia having been ridiculously exaggerated by some, and as ridiculously depreciated by others, deserves to be inquired into with some attention. The Strelitzes, the first regularly organized corps of infantry in the Russian service, seems to have had their origin about the middle of the 16th century; and continued, till their suppression by Peter the Great, to constitute the principal strength of the army. They enjoyed various privileges; were always about the person of the emperor; and, by their licentiousness and insubordination, as well as bravery, bore a close resemblance to the Praetorian bands of antiquity, and the Janissaries of the Ottoman Porte. The abolition of this formidable corps, and the reconstruction of the army on a plan similar to that followed in the more civilized countries of Europe, was undoubtedly one of the greatest services rendered by Peter the Great. At his death, the regular army amounted to about 110,000, exclusive of the imperial guard; and the success which attended his contest with the Swedes showed that this army was a match for the best troops that could then be opposed to it.

Under Catherine II., the army was greatly augmented and improved. This able and ambitious princess augmented the pay of the troops and officers, and gave them a new, more commodious, and elegant uniform than that formerly in use. She formed the Cossacks into a light cavalry, which, after being successfully opposed to the Spahis of the Turks, has since distinguished itself in the great contests of more modern times. During the latter part of the reign of Catherine the regular army amounted to about 250,000 men; and little was wanting to place it on a level with that of the surrounding powers, save the better organization of the commissariat department, and the choice of better educated and more skilful native officers.

It is, however, to the emperors Alexander and Nicholas that the Russian army is indebted for the more efficient organization, discipline, and power by which it is now distinguished. The momentous struggles in which the former was engaged called forth all the military resources of the empire; many abuses were rectified, and improvements introduced; and the armies of Alexander were at length enabled to contend successfully with those of the greatest captain of the age. Under the present emperor, the discipline and organization of the army have been still further improved; and it is, at present, in a comparatively high state of efficiency.

The Russian army has been newly organized, by a ukase of the 9th August, 1835. Down to that period, two large armies were maintained; but those were then consolidated, and the staff of one of them reduced. The army is now divided into six *corps d'armée* of infantry, each corps into three divisions, each division into two brigades, each brigade into two regiments, and each regiment into six battalions of 1,000 men each; four battalions take the field, and two remain as a reserve; so that each regiment, in fact, is 4,000 strong, and each *corps d'armée* 24,000 strong. To each of these six corps there is attached one division of light horse, in two brigades (Hussars and Muhlans) of two regiments each. Each regiment of horse consists of nine squadrons of 160 horses each, eight of which take the field, and one remains as a reserve; so that a regiment in the field has 1,280, and a division 5,120 horses. Besides this, each corps has a division of artillery united to it, consisting of three brigades, with four batteries each of eight guns, and one brigade of horse artillery, one reserved battery, one park of artillery, and three sapper battalions, together 6,000 men. This a complete *corps d'armée* is 60,000 men strong, with 120 pieces of artillery; and the whole active army 360,000 men, and 720 pieces of artillery. Then comes the corps of guards, in three divisions of infantry, three divisions of cavalry, and one division of artillery, with 120 guns; then the grenadier corps, equal in strength to an infantry corps; both together 114,000 men, and 240 guns. There are two reserved corps of cavalry, each of two divisions (Muhlans and Cuirassiers), each division of two brigades of two regiments each, with two brigades of horse artillery, and a dragoon corps in two brigades of two regi-

\* This, according to the intelligent author of the *Voyage de deux Français*, is a decisive criterion by which to distinguish the genuine Russian.

ments each, and one brigade of horse artillery; altogether this cavalry corps consists of 30,000 men and horses. Finally, there are two independent *corps d'armée*, of the Caucasus and Siberia, the first equal in strength to a whole corps, the latter to half a one; so that the entire strength of the regular army in time of peace amounts to 594,000 men; which, at present, is equal to one per cent. of the population, as the Asiatics, and particularly those tribes who serve as Irregular troops, are not included in this account. (*Suppl. to the Conversations Lexicon of Gegenwart*, Engl. trans. p. 198.)

But exclusive of the above, the troops not of the line, or those forming the Irregular army, constitute a very formidable force. They consist, 1st, of upwards of 50,000 men in garrison in different parts of the interior, and along the frontier; 2d, of above 100,000 veterans, mostly employed for the same purpose; and 3d, of the Irregular Cossack cavalry, and the colonized regiments.

The really effective force of the Russian army may, therefore, be reckoned at about 600,000 men; but from this various deductions must be made. Two out of the six battalions of the different regiments are almost always absent, constituting, in fact, *dépôts*, being employed in public works, in the conveyance and training of recruits, &c. It is believed, too, that the losses actually embodied rarely come up to the returns, the recruits being driven, by the insufficiency of their allowances, to add to their means of subsistence by keeping up a trade in the ranks. And if, in addition to the various causes of debilitation, we bear in mind that Russia must always, in the event of her being engaged in foreign war, keep a large amount of forces at home to guard the frontiers, and to maintain tranquillity in Poland and other disaffected provinces, it will be seen that, at present, she would have considerable difficulty in marshalling 200,000, or even 150,000 men across the frontier. When Napoleon invaded Russia in 1812, the entire force brought to oppose him scarcely exceeded 200,000 men. During the last war with Turkey, the invading army did not exceed 120,000.

Even if the troops really at the disposal of government corresponded with those in the official returns, Russia would find great difficulty in sending large armies into distant countries, and maintaining them when there. Her finances are far from being in a flourishing state; and owing to the abuses that prevail in her commissariat department, a great expenditure is incurred at the same time that the troops are often very ill-provided with the most indispensable necessities.

At home, however, Russia is all but invulnerable. The severity of the climate renders it next to impossible for an invading army to maintain any permanent footing in the country; whilst the nature of the ground, without roads, and intersected with forests, rivers, and marshes, opposes the greatest obstacles to the advance of an invading force, and still more to its retreat. Even though the army of Napoleon had not had to contend with the rigours of an unusually early winter, the result of his expedition could not have been materially different. He could not possibly have maintained himself during the winter at Moscow. Sooner or later he must have retreated; and a retreat through such a country, and in presence of a powerful enemy, ready to take every opportunity of attacking, could not fail to be most disastrous.

The troops of the Imperial Guard are a very fine body of men. Generally the Russian soldiers are, in respect of bodily vigour, inferior, perhaps, to those of England. They have no enthusiasm; and in respect of activity and intelligence, are very far below those of England, France, and Prussia. On the other hand, however, they possess, in the greatest perfection, the two first qualities of a soldier; the most unflinching courage, and the most implicit obedience. Subjected from birth to a master whose will is their law, the habit of prompt and absolute obedience becomes, as it were, a part of themselves. Regardless of dangers or difficulties, they will attempt whatever they are ordered; and will accomplish all that the most undaunted resolution and perseverance can effect. They also endure, without a murmur, the greatest hardships and privations, and support themselves in situations where others would starve. The Cossacks, *Buschkirs*, and other Irregular cavalry, are very useful troops, and are well calculated either to improve a victory or to cover a retreat. Contrary to what might have been expected, the artillery is the department in which the Russians have made the greatest advances; but it is said to be in excess as compared with the other descriptions of force. Were the officers as intelligent and skilful as the soldiers are brave and docile, the Russian army would be most formidable. But this is far from being the case. Latterly, however, great efforts have been made to improve the education of the officers, and exclusive of the establishments for that purpose mentioned below, a military academy was opened at Petersburg in 1832, where officers not above the degree of captain are instructed in military service; and in 1837 a school for 100 cadets for the artillery and engineers was opened at Woronesch. The pay of the officers, though

still miserably low, has been increased; and the present emperor has endeavoured to excite the martial spirit of the people, and to make the service popular, by instituting grand military spectacles. Some of these have been on a gigantic scale. At the grand military and religious festival in commemoration of the battle of Borodino, in 1839, no fewer than 120,000 troops were present! Marshal Marmont has spoken in high terms of the efficiency and discipline of the Russian forces he reviewed in the S. provinces in 1834.

**Recruiting.**—The army is recruited from the classes of peasants and artisans, every individual belonging to them being liable to compulsory service, provided he be of the proper age and stature. The levies are ordinarily in the proportion of 1 or 2 to every 500 males; but during war the proportion is at least as 2 or 3 to 100, and sometimes as much as 4 or even 5 to 100. This last proportion, however, of that of 5 to 100 males, may be taken as the *maximum* levy, and is rarely exceeded. The number of recruits to be furnished by the empire in general, and by each district in particular, is fixed according to the results of the preceding census. The nobles nominate such of their serfs as they please to complete their quotas, the only conditions being that they should have a good constitution, and be of the requisite size, and not less than 18 nor more than 40 years of age; and, as idle, ill-disposed individuals are sure to be nominated in preference for recruits, those who are averse from the service endeavour to distinguish themselves by industry and good conduct. The *minimum* standard height for infantry is not less than 1 mètre 594 millimètres; and for a cavalry, 1 mètre 600 millimètres. The recruits are first sent to the recruiting establishments, and thence forwarded to the corps to which they are assigned. Nobles, magistrates, clergymen, and students are exempted from the service. Merchants and traders enrolled in the different guilds are also exempted; the levies furnished by the Cossacks are regulated by particular treaties; and many half savage tribes are exempted, partly on account of their diminutive size, and partly because of their great aversion to a military life. Generally, it is found that a levy of 2 on every 500 males produces a supply of about 20,000 or 100,000 men. Substitutes are allowed, and may be effected by mutual consent, provided the noble be informed, and do not oppose it.

A ukase of the 3 (15) Sept. 1827 fixes the period of service at 20 years in the Imperial guard, and 22 in the other corps. Every individual, with his family, if he have one, becomes free the moment he is enrolled in the ranks of the army. In case of desertion, he is again enslaved; but desertion is exceedingly rare in Russia.

The guard is recruited from the gentry; the latter from the infantry of the line and light chassours.

**Promotion.**—After two years' service a soldier may become a *sub-officer*. The sub-officer who has served twelve years obtains of right the rank of sub-lieutenant or ensign.

Children of soldiers are educated at public military schools, or at schools belonging to the regiment; those who pass their examination with credit become sub-officers. There are at Petersburg schools for pages, engineers, officers of artillery, sub-officers of the guard, &c.; the rank of ensign being given to pages who have gone through a certain course, and to gentlemen cadets who have been two years in the service. But the principal establishment for the education of officers is that of the *Corps des Cadets* at Petersburg, founded in 1731. It has about 700 pupils, the sons of noble parents, that is, of those who have attained to the rank of captain in the civil or military service. The pupils are divided into five classes, and on leaving school become ensigns in regiments of the line. This school has materially contributed to diffuse information among the inferior nobility, and to supply the army with able officers. There are also schools for cadets at Moscow, Woronesch, Polotsk, Tula, Tamboff, and other towns. The pupils leave after a fixed time, and are ranked as ensigns.

During peace promotion depends upon seniority, from the rank of ensign to that of colonel; during war it is determined indifferently, by gallantry, selection, and seniority.

**Pay, &c.**—The Russian army is supported at very little expense. Exclusive of their pay, the higher class of officers receive considerable allowances, as mess-money, &c.; and they generally contrive to eke out their emoluments in various indirect ways. The pay of the subalterns is the most inadequate; and it is hardly possible for any one to serve as a subaltern in the cavalry, especially in the cavalry of the guard, unless he have private resources. Officers are allowed, according to their rank, one or more servants (*deutschkis*), maintained by government, but equipped at the expense of their masters. They are taken from among the recruits, the least suitable for active service. The pay of a common Russian soldier does not exceed 25s. a year; and various deductions are made even from this miserable

plittance. He gets a new uniform each year; and is allowed, in addition, 3 barrels of flour, 24 lbs. of salt, and a certain quantity of rye or oatmeal. On fête days the soldiers of the guard receive a certain allowance of butchers' meat, but this is very rarely tasted by their fellows. At home the soldier is paid in paper; but when he crosses the frontier he is paid in silver roubles; and as one of the latter is equivalent to four of the former, his pay, when abroad, is, of course, augmented in the same proportion. This may, perhaps, have been partly intended as a stimulus to the soldier to undertake offensive operations; but, besides having this effect, it was absolutely necessary, to enable him to subsist among foreigners without robbing. The cavalry horses are very good; and, fodder being very cheap, they are well kept.

Soldiers leaving the army on the expiration of their compulsory service are entitled to a small pension; and those who have been maimed or wounded are received and supported in some of the hospitals established in that view in different parts of the country. Soldiers who continue in the army after their term of compulsory service has expired acquire several advantages. They receive, exclusive of the retiring pension to which they are entitled, double pay; and after five years' voluntary service they are entitled to a retiring pension equal to three times their original full pay.

The inadequate pay of the officers and men is the grand evil in relation to the Russian army. It compels all classes to resort to underhand methods of making money; and hence the jobbing and corruption of the first, and the thievish habits of the latter. Government is plundered in every possible way; and while the army loses in strength and efficiency, it may be questioned whether it would not be more advantageous, even in a pecuniary point of view, for government to increase the pay of the officers and troops, so as to raise them above the necessity of indulging in practices injurious to the service, of the existence of which it is well aware, but at which, as matters now stand, it is obliged to wink.

Capital punishments are at all times rare in the Russian army, and are never inflicted except during war. During peace culprits are uniformly condemned to transportation to Siberia, and to forced labour in the mines. Corporal punishments may be ordered by the commanding officers of regiments, but they cannot be carried beyond twenty strokes of the knout, and are not to be inflicted except for very grave offences. Soldiers who continue in the army after their full period of compulsory service is exhausted cannot be corporally punished except by command of a council of war.

**Military Colonies.**—Exclusive of her ordinary forces, Russia has a considerable force of military colonists. These are a sort of agricultural soldiers established by a ukase issued in 1818, agreeably to the suggestion of General Arakcheyef. The object was to create a military force at the least possible expense, by engaging military service upon the agricultural labours of the peasants. For this purpose certain districts belonging to the crown were selected in the environs of the lake Ilmen, in the government of Novgorod, and in some of the southern governments, the territory of which was distributed among the peasantry, at the rate of about 15 desiatines, or 45 acres of arable land to each head of a family, villages on an improved and uniform plan being at the same time erected for their accommodation. The stock and implements necessary for the cultivation of this land are furnished to the colonist by the crown, and he is charged with its cultivation, with contributing to the common magazine of the village, keeping up the roads, &c.; the surplus produce, after these outgoings and the provision for his family are deducted, being at his disposal. A soldier is assigned to each colonist, to be maintained by the latter; but the soldier is, in return, obliged, when not absent or engaged in duty, to assist the colonist in the labours of his farm. The colonists, as well as the soldiers, are deprived of their beards, and wear uniform, every thing within the colony being subject to military regulation; there is no restraint on the marriage of the soldiers; and their male children, and those of the colonists, are all bred up to be soldiers. The girls are educated in separate schools; and, though there be no regulation to that effect, are generally married to the young men belonging to the colonies. Exclusive of the principal soldiers already alluded to, there is in every cottage a substitute or supplementary soldier, generally a son of the colonist, who is bound to take the place of the principal soldier in the event of his death or sickness, so that the regiments distributed among the colonies can never want their full complement of men.

The colonies may contain in all from 50,000 to 60,000 troops; but, notwithstanding what Marshal Marmonot has stated to the contrary, the experiment is now generally regarded as a failure. It will always, indeed, be found to be impossible successfully to combine the business of agriculture with the military service. The soldiers get attached to their farms and families, and be-

come unwilling to leave them and impatient of military restraint. Few, indeed, at all familiar with such subjects, will be surprised to learn that considerable discontent has, at different times, prevailed among the colonies in question. A dangerous mutiny, in which several officers lost their slaves, was not suppressed except by the presence of the emperor, who discovered on this occasion his usual courage and decision. Indeed, the general opinion is that the military colonies will be gradually abandoned.

**Navy.**—Russia has a very considerable naval force, the fleet comprising about 50 ships of the line, 25 frigates, 10 steam ships, and about 600 smaller vessels. She is indebted for her naval power, as she is for her ascendancy by land, her civilization, and, indeed, every thing else, to the creative genius of Peter the Great. Previously to his accession, Russia had no sea-port, other than Archangel, and did not possess a single gun-boat. As soon, however, as Peter had acquired a footing on the Baltic, he set about creating a navy; and the better to qualify himself for the task of its construction, he visited Holland, where he not only made himself acquainted with the principles of naval architecture, but with the practical business of a ship's carpenter, by working himself at this employment! The monarchs since Peter, and especially Catherine II. and the present emperor, have all exerted themselves to increase and improve the fleet; and it is now, perhaps, in as high a state of efficiency as it is likely to attain.

The truth, however, is, that though the naval force of Russia be sufficient to give her an overwhelming influence in the three inland seas connected with her empire, or in the Baltic, the Black Sea, and the Caspian, it is not in the nature of things that she should ever be able to cope with the maritime powers situated on the ocean. The Baltic, in fact, affords no proper field for the training and exercise of a fleet. Besides being limited in extent, it is frozen over for half the year; during all which time the ships have to be laid up; and the crews being on shore, cannot possibly attain that skill in seamanship, and dexterity in manoeuvring, that is attained by sailors constantly afloat. And, by a singular contradiction, instead of attempting to obviate this state of things, and sending squadrons into the open seas, and keeping them afloat all year, it is a rule of the Russian service, that every third year the seamen, if so we may call them, shall not go to sea at all! Nothing, therefore, can be more idle and unfounded, than the statements so frequently put forth as to the danger to be apprehended from the increasing naval power of Russia. Such dangers are wholly imaginary. The physical circumstances under which she is placed must always prevent her from becoming a great naval power. She is superior, by far, to any other power on the Baltic, the Black Sea, or the Caspian; but there her ascendancy naturally stops; and any attempt on her part to construct fleets to cope with the maritime powers, properly so called, would be a most absurd and improvident waste of the national resources.

Russian ships, both in the Baltic and Black Sea, last but a very short time, and, consequently, are very expensive. The great naval stations are Cronstadt, in the Gulph of Finland, and Sevastopol, in the Black Sea.

**Education** in Russia is at a very low ebb. There have for more than a century been schools in all the great towns; but these are but few in number; and the rural population is too much dispersed, even if it were not enslaved, and tied down to routine practices, to allow it to reap much benefit from country schools. But, notwithstanding the difficulties in its way, education is making progress, and has been much improved and extended within the present century. It has always been, and continues to be, an object of great solicitude with the government. A plan for a national system of instruction was laid down in a ukase of the Emperor Alexander, issued in 1802; which, though it has undergone various modifications, contains the outline of the system that is still followed. The empire is divided in respect of education into a certain number of districts, each of which has, or is intended to have, a university, with a certain number of lycæums (at which the young men intended to fill civil offices are mostly instructed), gymnasiums, high schools and elementary schools, varying according to its extent and population. At present the districts are those of Petersburg, Moscow, Kharkof, Kasan, Dorpat, Kieff, Helsingfors, Odessa, White Russia, the Transcaucasian provinces, and Siberia; but of these only the first seven have universities. A curator, or inspector, is placed at the head of each district, who is in constant communication with the minister of public instruction. The subjects and courses of study, the examinations to be gone through, the fees to be paid, &c. are all fixed by government. The sum placed annually at the disposal of the minister of public instruction amounts to above 3 million roubles.

The Report of the minister of public instruction to the emperor, at the close of 1836, gives various details as

to the then state of the higher departments of public instruction ; and has partly supplied us with the following information :—

1. *University of Petersburg.*—This university, founded in 1819, had, in 1838, 73 professors and subordinate functionaries, and 385 students. The six governments dependent upon it had eight gymnasiums.

2. *University of Moscow.*—At the above epoch this university, founded in 1755, had 99 professors or functionaries, and 611 pupils. In its library were near 45,000 volumes. It had nine governments within its jurisdiction ; and in these there were, in 1835, a lyceum, an institution for nobles, nine gymnasiums, five free schools, 75 central schools, and 152 parish schools. The surveillance of the system is committed to the care of an inspector and five sub-inspectors. A school has since been founded in Moscow for the gratuitous education of the sons of 50 decayed merchants.

3. *The University of Kharkof,* founded in 1803, had 81 professors, &c., and 315 pupils. The eight governments under its jurisdiction had, in December, 1835, seven gymnasiums.

4. *The University of Kasan,* founded in 1804, had, in 1838, 76 professors, &c., and 170 pupils. The nine governments under its jurisdiction had each a gymnasium. The Arabic, Persian, Turkish, and Mongolian languages are taught in this university.

5. *The University of Dorpat,* founded in 1822, one of the most celebrated in Russia, had, in 1838, 74 professors, &c., and 563 pupils. The university library had 58,436 volumes ; and there is attached to the institution a botanical garden and a museum. The three governments under its jurisdiction had, in 1835, four gymnasiums, and 156 public schools with 3,750 pupils.

6. *The University of Kieff,* called St. Wladimir, was founded in 1834, being intended to supply the place of that of Wilna, suppressed after the late Polish insurrection. It had, in 1838, 88 professors and subordinate functionaries, and 203 pupils. It is well endowed, its revenues having amounted, in 1835, to 250,000 roubles. There are four governments under the jurisdiction of this university, in which were one lyceum, seven gymnasiums, and 25 free schools with 461 pupils. Government provides for the education of 50 pupils at this university, of whom 26 are trained to be teachers, and 24 are to be instructed in the law, so as to enable them to fill judicial and other civil offices in the old Polish provinces.

7. *The University District of White Russia* includes five governments and a province. It has as yet no university ; but it had, in 1835, 12 gymnasiums and a high school.

8. *The University of Helsingfors,* in Finland, founded in 1827, instead of that of Abo, destroyed by fire in the course of that year. In 1832 it had about 40 professors, &c., and 425 pupils. There are in the grand duchy of Finland about 390 establishments for educational purposes.

9. *University District of Odessa.*—In this, as in the district of White Russia, no university has as yet been established. But there is a lyceum in Odessa ; and in the three governments and provinces subjected to its jurisdiction, there were, in 1835, 5 gymnasiums, and 13 high schools.

10. In the *Transcaucasian district* there is a gymnasium, a free school, and 12 central schools.

11. The number of schools in Siberia is not specified ; but there is said to be a great want of teachers there, as there is in most other divisions of the empire.

Besides the above there are various schools founded for particular objects, and not coming directly under the control of the minister of public instruction. Among others may be specified the military schools in Petersburg, Moscow, and other towns ; schools for the special use of the nobility ; the schools of the surgeon-medical academies of Petersburg, Moscow, &c. ; schools founded and endowed by individuals, and those founded by and placed under the control of the clergy.

The latter, or the theological schools, intended principally for the instruction of the sons of the clergy, are amongst the most ancient and important of any in Russia. They consist of 4 principal academies at Kieff, Moscow, Petersburg, and Kasan, which give instruction in the higher branches, and confer the degrees of A. M. and M. D. ; of 36 diocesan schools ; and of between 350 and 400 district schools, at which considerable numbers of the inferior classes are instructed ; and of a still greater number of parish schools. The total number of scholars in these 4 descriptions of schools may vary from 60,000 to 75,000. Though the sons of the clergy generally follow the profession of their fathers, this is not always the case. Occasionally they enter the civil service, and some of the most celebrated statesmen, historians, poets, &c. of Russia, have sprung from this class. (*Dr. Pinkerton's Russia*, p. 251.; *Schottler*, &c.)

Elementary instruction is in the most depressed state. According to the ukase of 1802, a grammar school should be established in every district, and an elementary school

should be established in every parish, or at least in every two parishes, according to the population. But these regulations have, in very many instances, not been complied with ; and when it is considered that the advantages of education are but little appreciated by the peasantry, and that it is frequently discouraged by the nobility, to whom it occasions some expense, it will not appear surprising that such should be the case. In despite, however, of every obstacle, education has made and is making a very considerable progress. This is seen from the following statement of the schools in existence in 1804, 1824, and 1835.

	1804.		1824.		1835.	
	Schools.	Pupils.	Schools.	Pupils.	Schools.	Pupils.
Schools under Imperial Public Instruction	499	33,481	1,411	69,629	1,681	85,707
Military schools	15	29,000	117	102,295	152	179,580
Ecclesiastical do.	109	15,000	544	50,000	601	67,424
Special do.	13	31,775	46	41,340	1,522	127,860
Totals	627	109,256	2,118	263,224	3,956	460,571

Of the total schools existing in 1835, 2,841 were maintained at the expense of government. Among the scholars, no fewer than 252,311 enjoyed bursaries, or were educated gratis. The total expense incurred that year by government for school purposes amounted to 28,734,141 roubles. Since 1835 the number of schools has been considerably increased ; and if we add to the pupils at school those receiving instruction at home, it will be seen that education has made a rapid progress in Russia ; and that though very backward, especially in the country districts, it is far more generally diffused than is generally supposed.

Since the epoch of the Polish insurrection, the government of Russia has discovered considerable jealousy with respect to education. In consequence all Russian subjects have been forbidden from studying at any foreign university ; a strict surveillance is exercised over all descriptions of schools ; no private schools are in future to be opened without permission from the proper authorities, and all masters and mistresses of such seminaries must be native Russians ; and it is further ordered, that no one shall be a teacher in a private family without being accredited by a university, and having a certificate of capacity and good conduct. The sciences principally taught in the universities are the history, literature, geography, and statistics of Russia.

Lectures on politics or political economy would be esteemed dangerous, and are forbidden. The object of these regulations is manifest ; and we are not surprised that some of them should have been adopted. But, whatever may be the case with the higher branches, the government has had sagacity to perceive that the diffusion of elementary instruction, including the principles of the useful arts, would not tend to shake the stability of the existing order of things, while it would do more than any thing else to raise the peasantry from the state of ignorance and debasement in which we now find them, and to develop the resources of the country. Great numbers of new schools have been opened within the last half dozen years ; and lectures on agriculture, and the application of science to art, have been established in the different universities.

The fact is, that a taste for instruction and reading is beginning to be widely diffused among the town pop. Many new works, some of them of distinguished merit, annually appear ; and many foreign works are translated into Russian. Numerous literary and scientific journals issue from the presses of Petersburg, Moscow, Niga, Odessa, &c.

The journals of a political caste being subjected to a severe censorship, afford no means of judging of the prevalent political feelings of the mass of their readers. All works and journals imported from abroad must also be submitted, under heavy penalties, to the inspection of the censors. This jealousy of whatever might tend to expand the minds of the people, and to make them acquainted with their rights and duties, is the grand obstacle to the civilisation of the higher classes and burghers. But, notwithstanding the censorship, about 300,000 volumes of foreign works, principally French and German, are annually imported.

Professors and teachers in universities and other seminaries obtain rank, and rise according to merit and seniority ; and when unfit for the active duties of their station, they receive a small pension. But their regular salaries, like those of almost all other Russian functionaries, are totally inadequate to support their rank and station in society. A professor has only about 800, a year, and his assistant 320 ; a professor of languages has 240, and each of the students, supported by the crown, 80, a year ! The institutions of Moscow and Tsarskoye-Zelo

are the most distinguished of those intended for the instruction of nobles. In the first there are about 300 boarders, paid for by their parents; the rest attending as day-scholars. The first class pay 32*l.* a year, and the second 24*l.* (*Pinkerton's Russia*, p. 256.)

The pedagogical institution of Petersburg is one of the most important and valuable in the empire. It is exclusively appropriated to the education and training of schoolmasters. In 1835 it had 45 functionaries and 144 pupils.

Young men belonging to great families used formerly to be, for the most part, educated at home by foreign tutors, of whom not a few were ignorant, unprincipled, and servile. But an edict of the emperor Alexander contributed to subvert this practice, by excluding all young men, not educated at a public seminary, from the higher class of public employments; and, as already seen, it has been still farther discouraged by the present emperor.

*Races.*—The Russian empire embraces at present an immense variety of different races; but the great bulk of the nation, or the Russians properly so called, with the Poles, and also the Bulgarians and Servians, belong to the great Slavonic family. The Slavonians are most generally supposed to be the descendants of the *Sarmatæ* of antiquity; but, though probable, this is by no means certain. At all events, they are radically distinct from the Goths, on the one hand, and from the Tartars and other Eastern nations, on the other. There is no foundation whatever for the common opinion that they were denominated Slavonians from their being originally slaves. On the contrary, when first known to history, the Slavonians were as free as the Goths. The practice of slavery was gradually introduced; and in Russia it was not completed till the beginning of last century. (See Dr. Pinkerton's *Russia*, p. 276., and the authorities there referred to.) The individuals of Slavonic origin at present within the limits of the Russian empire are supposed to amount to about 46,000,000, being about three fourths of the entire pop.

The next principal race is that of the Ouralians or Finns, inhabiting the grand duchy of Finland, Estonia, Lapland, and several districts in the north of the empire. The Finnish population is believed to amount, in all, to above 3,000,000 individuals. The Letto-Lithuanian race, amounting to nearly 2,000,000, is principally found in Lithuania and the W. provs. There are, also, about 2,000,000 Tartars; 2,000,000 Georgians, Armenians, &c. The Germans settled in various parts of the empire may be taken at about 450,000; and there are, besides, 1,064,000 Jews, with Sannoyeds, Mongolians, Kamchatskades, Americans, &c.

*Language.*—Those who are aware of the various races and the numbers of different people included within the Russian empire, need not be surprised that about forty distinct languages are in use, having attached to them an immense number of different dialects. The individuals belonging to the Slavonic race have two languages—the Russian and the Polish, both derived from the ancient Slavonic. This mother-tongue, augmented and modified by the influence of Christianity, which introduced into it a number of Greek words, and by the dominion of the Tartars, by whom it was loaded with Turkish and Mongolian terms, was gradually formed into the Russian. The primitive idiom continued, however, to be employed in the liturgy and the sciences till the reign of Peter the Great, when the Russian gained that ascendancy in religion and science it had already gained in conversation. The extraordinary advances that were then made in civilisation occasioned the introduction of an immense number of new words. At length the language became tolerably well fixed. The alphabet, which consisted originally of 45, has been reduced to 37 letters, some of them borrowed from the Greek and others from the Latin. Some characters are, however, quite unlike those of any other language, and can hardly be pronounced by any save Slavonians. The grammatical forms are not well defined, and the conjugations are exceedingly irregular. Otherwise the language is rich, sonorous, flexible, natural, and elegant. The variety of its terminations is very remarkable. There is very little *patos* in Russia; the language of the country differing but little from that of the towns. There are, however, three principal dialects; 1st, the *Great-Russian*, the pure or cultivated language of the nation, spoken in Moscow, and all the central parts of European Russia; 2d, the *Mal-Russian*, or language of the S.E. parts of Russia in Europe; and 3d, the *White-Russian*, or dialect spoken in Lithuania, Volhynia, &c. It is a curious fact, that the first grammar of the Russian language appeared at Oxford in 1696. The best grammar is that of Dobrowski, published at Vienna in 1822. The Russian Academy has published a dictionary of the language in 6 vols. 4to., 1806–1822.

*Literature.*—Russia has had several distinguished natural philosophers and mathematicians, but they have been chiefly foreigners (Germans principally) resident in the country. At present the literature of Russia occupies

a respectable place in that of Europe. The introduction of Christianity was marked by the growth of a taste for letters among the ancient Slavonians; but the only remains of that early literature are some fragments of chivalrous poetry, and the annals of the monk Nestor. The Tartar invasion arrested the progress of literature, and Russia fell back into the abyss of barbarism, whence she did not begin to emerge till after the accession of the house of Romanoff. The attempts of the restorers of literature were at first confined to some feeble dramatic performances; and towards the close of the 17th and the beginning of the 18th centuries to miserable imitations of French and other foreign works. In the course of the 18th century, however, Lomonossoff created, by his precepts and his example, a national literature. Soumarokoff carried the drama to a high degree of perfection, and since then a crowd of writers have distinguished themselves in all departments, from the *epopee* down to eclogue and fable; and the national literature continues to flourish with undiminished vigour. The History of Russia, by Karazin, now in course of publication, is a work of great merit. Numerous journals or periodical publications, in different languages, devoted to politics, literature, and science, appear in different parts of the empire; but so long as these are subjected to a severe censorship, and as the government looks with jealousy on anything approaching to the expression of a free opinion, the political and philosophical works of Russian writers can be but little deserving of attention. The first Russian press was set up at Kief in 1551. Previously to 1800, there had not been printed above 1,000 works in Russia; in 1807, the number of such works was about 4,000; in 1821, they amounted to 13,249, and at present (1840) to more than double this number, about a third part being translations from the French and other foreign languages.

Russia has some splendid libraries and museums. The imperial library at Petersburg contains about 400,000 vols. and 17,000 manuscripts; and the Romanzow Museum contains a large collection of national antiquities and of every kind of curiosities.

*Religion.*—Most religions to be found in the ancient continent have their adherents in Russia. The court, however, and the great body of the nation profess the Russo-Greek Christian faith, denominated by its votaries the orthodox or true Catholic faith. The points in which it principally differs from the Roman Catholic faith, are, its denying the spiritual supremacy of the pope, its prohibiting the celibacy of the clergy, and its authorising all individuals to read and study the Scriptures in their vernacular tongue. The prohibition of celibacy is carried to such an extent, that no priest can perform any spiritual function before he is married nor after he becomes a widower; and as he is not allowed to remarry, the death of his wife and the cessation of his functions as a priest (unless he be specially allowed by the bishop to continue them) are necessarily identical! The priests may, however, on the death of their wives, enter into a convent, and enjoy the barren privilege of becoming eligible to be dignitaries of the church. Pictures of saints are admitted into the Russo-Greek churches and houses; but all statues, bas-reliefs, &c., are rigidly excluded. There are several feasts, of which that of Easter, which continues for seven weeks, is the longest and strictest. Divine service is performed in the native tongue; and singing in churches is unaccompanied by any sort of instrumental music. The total pop. professing the Russo-Greek faith may be estimated at about 50,000,000. No country in Europe possesses such a number of fine churches as Russia. The meanest village is generally furnished with a temple ornamented with gilded domes and spires. These edifices are nearly all in the Grecian style of architecture, substantially built of brick, plastered and painted with much taste, forming a striking contrast to the huts or izbas of the peasantry by which they are surrounded.

There are in all Russia nearly 500 cathedrals and about 29,000 churches attached to the establishment of the latter employing about 70,000 secular or parochial clergymen. There are also about 550 convents, of which 450 are for men and 70 for women. Adjoining to each church or near it, there is always a *kolobadnia* or bellry, commonly of great height, and provided with large bells, which are tolled several times during every service, and on holidays kept ringing the whole day. The Russians are passionately fond of the sound of bells, and larger and finer ones are nowhere to be found; every church has in its steeple four or five of different sizes; and in many this number is doubled and even trebled. (*Pinkerton's Russia*, p. 268., &c.)

The Russian church was long subordinate to that of the Eastern empire, its metropolitans being nominated by the patriarch of Constantinople. But after the capture of the latter city by the Turks in 1453, the Russian clergy appointed their own metropolitans. This practice continued till the reign of Peter the Great, who declared himself the head of the Russo-Greek

church, appointing, at the same time, a synod for the management of its affairs. The clergy are either secular or regular—the former consisting of the parochial clergy, and the latter of the higher dignitaries, monks, &c. The hierarchy is composed of bishops, archbishops, and metropolitans. There are in all thirty-eight dioceses.

In Russia, as in most other countries, the piety, or superstition, of individuals, had conferred great wealth on the church, particularly on the monasteries. This having occasioned many abuses and irregularities, afforded a pretext, of which Peter the Great availed himself, not only to suppress various monasteries, but to deprive the church of the greater part of its wealth. In the reign of Catherine II., the degradation of the clergy was completed by the appropriation of the whole immovable property of the church to the use of the state, pensions being assigned, in its stead, to the different functionaries to whom it had belonged. But, with the exception of a few livings in Petersburg, Moscow, and other principal cities, the stipends of the clergy, even when increased by the offerings of the people, and by the perquisites on occasion of births, marriages, funerals, &c., are quite inadequate to provide for the ecclesiastical subsistence. The total number of established clergy, of all ranks and orders, may be taken at about 254,000; and the sum allowed as stipends by government is so very small, that they are almost wholly dependent on their flocks. The revenue even of the senior metropolitan, the highest dignity in the hierarchy, did not recently exceed 600*l.* or 700*l.* a year; and an archbishop, or abbot, the class next below a bishop, had not generally more than from 40*l.* to 50*l.* a year! (*Pinkerton's Russia*, p. 211.) Mr. Cox says, that "besides the surplice fee, which in the poorest benefices amounts to 4*l.* a year, and in the most profitable to but 20*l.*, they have only a wooden house, scarcely superior to that of the meanest among their parishioners, and a small portion of land, which they generally cultivate with their own hands; while the highest dignity to which they can ever attain, so long as they continue married, is that of a prototype of a cathedral, whose income scarcely exceeds 20*l.* a year." (*Travels in Russia*, &c. iii. 143.)

When such is their depressed condition, we need not wonder at the low state of learning and want of refinement among the great bulk of the Russian parochial clergy. Cox tells us, that when he was in Russia, many of the par. priests were so miserably ignorant as to be unable to read, even in their own language, the gospel they were commissioned to preach! But, though still very far behind, such gross ignorance is now much less common than formerly. The duties of the Russian clergy of all orders are very laborious. Dr. Pinkerton, whose authority is unquestionable, says, that we find in the family circles of the secular or parochial clergy, a degree of culture and good manners peculiar to themselves. This description of clergymen wear long beards, and form, in fact, like the priests of old, a kind of distinct class, or caste. None but the sons of clergymen are educated for the church; nor is there one instance in a thousand of any one belonging to any other class entering the ranks of the secular clergy. The regular, or dignified clergy, on the contrary, though often the sons of priests, not unfrequently receive recruits from among the nobles and other classes; and all the higher stations in the church continue to be filled up from their ranks. (*Pinkerton's Russia*, p. 250.) Orders, and other marks of distinction are conferred on the Russian clergy; and at present a bishop is little thought of unless he be decorated with the star and ribbon of some order of knighthood.

The Russo-Greek church has, from an early period, had its schisms and dissenters. The latter are said to be split into about 70 sects. They are classed under the common denomination of *raskolniks*. The ritual, or service of the Russian church is contained in *twenty volumes folio*, in the Slavonic tongue!

With the exception of the restraints laid on the Jews, who are excluded from Russia Proper, almost all religions may be freely professed anywhere in the empire. No member of the Russo-Greek church is, however, permitted to renounce his religion; and when a marriage takes place between one of its members and a person belonging to another faith, the children must all be brought up in the established faith. Catholics are very numerous in the Polish prov.; there are, also, large numbers of Lutherans, chiefly in the Baltic provinces, with Mohammedans, Jews, worshippers of the Grand Lama, Feteists, &c.

**Finances.**—Owing to the low state of civilization in most parts of the Russian empire, and the want of manufactures and great towns, the public revenue is by no means so great as might be supposed from the vast extent of the empire, and the magnitude of the pop. In consequence, however, of the cheapness of most necessary articles in Russia, and the small rates of pay of the soldiers and other public functionaries, her limited revenue goes a great way, and she is able to meet out-

goings that elsewhere could not be met with less than twice or three times the sum.

Most topics connected with the public revenue and expenditure, are involved in a mystery which it is not always possible to penetrate. The former is derived from a few sources, consisting of,

1. The capitation tax, charged on all the male boors belonging to individuals, and also on some descriptions of freemen. At an average it may be estimated at about 4 roubles a head; and estimating those subjected to it at 10,000,000, it will give 40,000,000 roubles.

2. The *Obruk*, or rent paid by all male boors on the crown estates. Imposing this tax at 10 roubles, and those subjected to it at 2,000,000, it will give a sum of 90,000,000.

3. The tax of 1*½* per cent. on the declared capital of the merchants. The amount of this tax may be taken at 8,000,000.

4. The customs' duties in 1839 produced very near 92,000,000 gross revenue. The expenses of collection amount to about 73 per cent. of this sum.

5. The spirit duties produce a very large sum. In Russia, properly so called, government reserves to itself a monopoly of distillation; but in the rest of the empire the produce of the distilleries, which any one may construct, is subjected to an excise duty. The consumption of spirits is very large; and the revenue thence arising may be estimated at 100,000,000. Among their other privileges the nobility may distil all the spirits required for their establishments free of duty.

6. The salt-mines and brine-springs are monopolized by government, which sells their produce at the rate of a rouble per peck. This monopoly is supposed to produce about 10,000,000 a year.

7. The crown mines, and the duties payable by the proprietors of private mines, produce together about 18,000,000.

8. The seigniorage on coin may be taken at 8,000,000. 9. Stamp-, licence-, &c., and the tax laid on the sale of immovable property, may be estimated at 100,000,000.

10. Miscellaneous items, such as the sums paid by the nobles to be exempted from furnishing recruits for the army, the rent of crown property let on lease, the profits of crown manufactures, &c., may be taken at 8,000,000.

Hence it may be concluded that the public revenue of the Russian empire amounts, in all, to 379,000,000 or 380,000,000 roubles a year, that is, to about 15,836,000*l.*

The taxes are partly farmed, and partly collected by government officers. There is, as already stated, in every government, a council charged with the administration of every thing relative to the finances.

Our information with respect to the expenditure is even less accurate than that respecting the income of Russia. In time of peace, however, they are understood to be nearly equal; but during war, or on extraordinary occasions involving an increase of expenditure, the ordinary revenue is quite insufficient to meet the outgoings, and it is usual both to increase the rate of taxation and to resort to loans. The expense of the army and navy (the latter being about one fifth or one sixth part of the former) amounts to more than half the revenue. The next great items are the interest and sinking fund on account of the public debt; the civil list; internal administration, public works, &c.; the diplomatic service, and various other items.

According to the report of the minister, M. Kankrin, the public debt amounted, in 1837, to 950,333,574 roubles. *Historical Sketch.*—The ancients had very little acquaintance with the vast countries included in the empire of Russia. The monarchy is usually regarded as having been founded by Rurik about anno 862, his dominions, and those of his immediate successors, comprising Novgorod, Kiev, and the surrounding country. In 980, Vladimir introduced Christianity, and founded several cities and schools. But, from this period down to 1237, when the country was overrun by the Tartars, Russia, with few exceptions, was the theatre of civil war. In 1328 the seat of government was transferred to Moscow; and in 1481 the Tartars were finally expelled. In 1613 the house of Romanoff, whence his present majesty is descended, was raised to the throne; and from this period the empire acquired strength and consistency. Under Alexis Mikhailovitch (1645—1676) White Russia and Little Russia were conquered from the Poles, and the Cossacks of the Ukraine acknowledged the supremacy of the Czar, various internal improvements were effected, and the power of Russia began to be felt and feared by all her neighbours. At length, in 1696, Peter the Great ascended the throne, and the destinies of Russia and of the northern world were immediately changed. This prince, who has, probably, a better claim than any other that ever existed to the epithets of "great" and of "father of his country," gave to the arms of Russia a decided preponderance in the north of Europe; he also gave her a fleet; conquered large provinces on the Baltic; laid the foundations of the noble city which bears his name; and introduced among

his people the arts, the literature, the customs, and, to some extent also, the laws and institutions of the more civilised European nations. The difficulties he had to encounter in his projects for remodelling and civilising his dominions were of the most formidable description; and could not have been overcome by any one possessed of less authority, or of a less stern decided character.

From this period Russia has progressively advanced in power and civilisation. Under Catherine II. (1762—1796), a princess of extraordinary talent, Russia acquired a vast accession of power by her acquisitions in Poland and on the Black Sea, where she has now the same ascendancy as in the Baltic. The history of Russia, during the present century, is known to everybody. The attempt of Napoleon to dictate a peace to the emperor Alexander, in the ancient capital of the Czars, led to the overthrow of his colossal power, and gave a vast accession of influence and consideration to Russia; which has been maintained and extended under the present emperor.

It would be idle to speculate upon the permanency of the present order of things in Russia. A great deal, in such an empire, depends on the personal character of the sovereign. The present occupier of the throne has every quality—good sense, undaunted courage, great decision, and the utmost vigilance and activity—required in the ruler of such a country. But should the government fall into less able and skilful hands, it is not improbable that Russia may become the theatre of revolution and change, for which, at present, she certainly is not fitted.

The following table gives a view of the extent of the Russian dominions at different epochs:—

	Germ. sq. m.
In 1553, at the accession of John the Terrible, his dominions comprised	37,200
— 1585, at his death	114,000
— 1613, at the accession of Michael Romanoff	148,000
— 1615, at his death	258,000
— 1725, at the death of Peter the Great	280,000
— 1741, at the accession of Elizabeth	325,000
— 1796, at the death of Catherine II.	356,000
And at present (1841)	561,000

Tables similar to this have been the theme of much silly declamation about the grasping, insatiable ambition of Russia. No doubt her rulers have the same desire to extend her territories as those of France, England, or any other power; but certainly they are not, in this respect, at all peculiar. In point of fact, however, by far the greater part of the territorial acquisitions of Russia have consisted of mere deserts, or of countries occupied by roving barbarians, and are worth little or nothing. Her really valuable acquisitions have been confined to those on the side of Poland and the Black Sea. Her conquests in this direction have added materially to her power; and it is but fair to add, that they have also added materially to the well-being and civilisation of the inhabitants.

**RUSTCHUK, or RUTSCHUK**, a fortified city of Turkey-in-Europe, prov. Bulgaria, cap. Sanjak, on the Danube, 56m. E. by N. Nicopolis, and 62 m. N.W. Shumla. Pop. variously estimated, but may probably be about 30,000. It is built on a steep bank, up which the streets ascend from the river. It is surrounded on three sides by walls, in the manner of Turkish fortifications; but towards the river it is partly open. At its N.E. extremity is a ruined citadel, on an abrupt height above the Danube. "The description already given of Belgrade applies, with very little modification, to this Bulgarian city, except that Rustchuk is not in such a state of dilapidation, and the Turks here appear more civilised than the Servians: they have schools for their boys; and several of the houses are furnished with glass windows. The comfort of fountains, simple as they are in exterior, and the luxury of coffee-houses, are not unknown to the Bulgarians; on the contrary, the one and the other abound in Rustchuk." (*Elliot's Trav.*, i. 180.) The streets are narrow and gloomy; on either side they present only dead walls; and as in all the rest of Bulgaria and in Roumelia, each of the larger houses is a fortress in itself. The governor's palace, some of the mosques, and some public baths are the only edifices worth notice. Many of the buildings are white-washed, and their tall chimneys are visible at a great distance. Woollen, silk, and cotton stuffs are made here; and there are many Turkish, Greek, and Armenian merchants in the town, who carry on considerable trade with Vienna, Wallachia, &c., in cloth, corn, and indigo. Mr. Quin observed in the shops of Rustchuk, "a rich display of military saddles and bridles, belts, and canteen-boxes, gaily ornamented; of Persian carpets, Broussa silks, ataghans, pistols, pipes, umbrellas, Greek caps, scarlet jackets, yellow slippers, gold-headed canes, fine cloths, woolen and cotton stockings, and every article of grocery, fruits, vegetables, meat, fowl, fish, hardware, and jewellery. The floors of these shops were usually elevated above the level of the street, and the owners and their assistants sat inside upon the floors, some

working as tailors, some as saddlers, and artisans of the ordinary trades." (*Voyage down the Danube*, 314-15.) In 1812, the Russians took and burned the citadel and a part of the town; and, in 1829, they entered the town after little opposition. (*Elliot's Trav.* i. 178—182; *Quin's Voyage*, 288—315; *Slade's Germany and Russia*, 187—189.)

**RUTHERGLEN** (pronounced Ruglen), a royal and parl. bor. of Scotland, co. Lanark, on the left bank of the Clyde, 2½ m. S.E. of Glasgow. Pop., in 1831, 4,741. It consists of one leading street, straight and well-paved, nearly ½ m. in length, 112 ft. broad, and of the parallel lane called the Back Row. From both sides of the main street, which lies in a direction nearly E. and W., cross a few cross lanes. There are no public buildings except the par. church, a *quoad sacra* place of worship connected with the establishment, a chapel belonging to the Kelfie, and the town-hall. A small cotton-mill employs about 80 hands; and there are two print-works in the vicinity, a Turkey red dye work, and a chemical work. About 500 hand-loom muslin weavers are employed by Glasgow manufacturers.

Rutherglen was created a royal bor. in 1126, at which time it was of more importance than Glasgow, the latter being included within its municipal boundaries. But in 1226, Alexander II. granted a charter to Walter, Bishop of Glasgow, relieving his town from certain servitudes previously due to Rutherglen. (*Mon. Corp. Rep.*, 1858, part ii. p. 371.) Previously to the passing of the Reform Bill, in 1832, Rutherglen, unimportant as it has been, enjoyed the same parliamentary privileges as Glasgow; being united with it and two other towns in sending 1 mem. to the H. of C. Glasgow has since that period had 2 representatives for itself; while Rutherglen joins with Kilmarnock and 3 other bors. in choosing a mem. Registered voters, in 1840, 1,170. Municipal councillors, 18; corporation revenue, 700*l*. (*New Stat. Ac. of Scotland*, sec. *Lanarkshire*, p. 373—398; *Ure's Hist. of Rutherglen*, 1793.)

**RUTHIN** (Welsh *Rhudd-dŷon*, or *Rhuthyn*, the "Red fortress"), a parl. and mun. bor., market-town, and par. of N. Wales, co. Denbigh, hind. Ruthin, in the vale of Clwyd, 17 m. W.S.W. Chester, and 43 m. N.W. Shrewsbury. Pop. of mun. and parl. bor., in 1831, 3,375. The town, situated on rising ground, chiefly E. of the town, consists of a principal avenue, entered by several other interior streets. At the summit is the market-place, in which is the town-hall, a substantial building, erected in 1663, but recently repaired. The town-hall, a fine modern stone structure, forms with the gaol an interesting feature in the town. The gaol, recently enlarged by the addition of a building for female prisoners, has suitable arrangements for the classification of the inmates. The church, originally conventual, belonging to a community of Bonhommes, is an ancient structure of mixed architecture; the tower, S. and W. fronts, being comparatively modern, and much inferior to the rest of the building. The interior is elegantly fitted up with stalls, tabernacle-work, &c., and the roof is of carved oak, panelled, and richly sculptured. It was made collegiate in 1310 by John de Grey, who formed an establishment for regular canons, and endowed it with valuable lands and numerous privileges. A part of the cloisters has been converted into a residence for the warden of Christ's Hospital, founded here by Dr. Gabriel Goodman, for the support of 12 decayed housekeepers. The warden and pensioners are inappropriators of the great tithes of Ruthin and Llan-Rhydd; and the warden, who is appointed by the dean and chapter of Westminster, is the vicar of both parishes, with an income of 263*l*. a year. The free grammar-school is endowed with a moiety of the tithes of Llan-Elidan, and is under the superintendence of the warden, though the appointment of the head-master rests with Jesus College, Oxford: the school ranks as one of the best in N. Wales, and is attended by about 50 boys. A national school is established here for 40 children of each sex; and there are Sunday-schools attached to the chapels of the Independents, Wesleyan and Calvinist Methodists. No particular trade or manufacture is carried on in the town, exclusive of what is necessary for the accommodation of the inhabs., who are principally employed in agriculture; and no change of any consequence appears to have taken place in it for several years, neither are any causes in operation or likely to operate towards the extension of the town beyond its municipal limits. (*Mun. Bound. Rep.*)

The corporation of Ruthin consists, according to the Mun. Reform Act, of a mayor, 3 aldermen, and 12 councillors. Corp. rev., in 1839, 145*l*. The bor. unites with Holt, Wrexham, and Denbigh, in sending one mem. to the H. of C., the right of election down to the Reform Act having been vested in the resident burgesses. The parl. limits, according to the Boundary Act, include, with Ruthin, parts of the pars. of Llan-Fawr, Llan-Rhydd, and Llan-Fair-Dyffryn-Clwyd. Reg. electors, in 1839-40, for the united bors., 911. Ruthin is likewise one of the polling places at elections for the co., and the

assize town; besides which the quarter sessions are held alternately here and at Deubigh. Markets, well supplied with corn, on Monday, and a provision market on Saturday. Fairs, March 19, Friday before Whit Sunday, Aug. 8, Sept. 30, and Nov. 10.

Ruthin, according to the Welsh historians, is of high antiquity; but we have no authentic information respecting it prior to the reign of Edw. I., who built here a magnificent castle, overlooking the Clwyd, on its W. bank, which he presented, in 1281, to Reginald de Grey. The ruins have been restored with admirable taste by the present proprietor. The manor of Ruthin belongs to the Lady Grey de Ruthin, daughter of the 19th baron of that name, who has been a great benefactress to the town.

RUTLAND, an inland co. of England, surrounded by Lincoln, Leicester, and Northampton. It is the smallest of the English cos., containing only 95,360 acres, of which about 90,000 are arable, meadow, and pasture. Surface, gently varied; air pure; and the soil almost every where loamy and rich. The W. par. of the co., in which is the Vale of Catmose, celebrated by Drayton, is under grass, and the E. chiefly in tillage. It is particularly celebrated for its wheat, cheese, and sheep. Estates and farms of various sizes. Average rent of land, in 1810, 20s. 9½d. an acre. The river Welland runs along its S.E. border, from Rockingham to near Stamford; and there is a canal from the river Soar to Oakham, the principal town. It is divided into 5 hundreds, and 25 parishes; and returns 2 mems. to the H. of C., both for the co. Registered electors, in 1839-40, 1,373. In 1831, Rutland had 3,935 inhab. houses, 4,191 families, and 19,385 inhabs., of whom 9,721 were males, and 9,664 females. Sum expended for the relief of the poor, in 1839-40, 7,246. Annual value of real property, in 1815, 138,216½; profits of trades and professions in ditto, 30,389.

RYDE, a town, sea-port, and watering place of England, on the N. side of the Isle of Wight, par. of Newchurch, and land of R. Medina liberty, 5½ m. E.N.E. Newport. Pop. of Newchurch, in 1831, 4,928, of which about 3,800 belonged to the town of Ryde. The latter has a peculiarly handsome appearance from Portsmouth, opposite to which it lies, at a distance of about 5 m.; its white houses, interspersed with gardens and plantations, being ranged in successive rows upon a tolerably steep acclivity, rising directly from the sea, backed by bold hills, and surrounded with cultivated land. It consists of a principal street, running upwards from the shore, and intersected by others, some of which comprise handsome detached residences, well adapted for the numerous visitors who flock thither during summer. It has two chapels-of-ease, one of which is a handsome modern structure, places of worship for Wesleyan Methodists, Baptists, and Independents, with attached Sunday-schools, and an endowed charity school; it has also a small theatre, assembly-rooms, libraries, baths, &c., and some good hotels. The accommodations for summer visitors have been greatly improved within the last few years, since Ryde has risen into favour; and a pier, constructed on wooden piles, runs ¼ m. into the sea, making the town accessible seaward at all times of the tide. Steam-boats run nearly every hour in the day, during summer, between Ryde, Portsmouth, Cowes, and Southampton; and the opening of the South-western railway has occasioned a great influx of visitors to this and its rival watering-place, W. Cowes. The air is salubrious, and in the environs are many agreeable walks commanding fine land and sea views; but as a bathing place, Ryde is inferior to Southsea, on the opposite coast of Hampshire, or to Cowes, on account of the shallowness of the water for a lengthened distance from shore. It has no manufactures, and its trade is principally confined to the supply of visitors and the inhabs.

RYE, a parli. and mun. bor., cinque port, market-town and par. of England, co. Sussex, hund. Godstow, rape Hastings, on the Rother, about 3 m. from its mouth, 38 m. E. by N. Brighton, and 53 m. S.S.E. London. Pop. of parli. bor. (which comprises with the par. of Rye that of Winchelsea and 6 others, with a portion of the par. of Brede), in 1831, 7,700. The town, which stands on the edge of an extensive tract of marsh land, running along the coast as far as Hythe, consists of several regular and well-formed streets, lined with old, but respectable-looking houses, many of which command fine views of the channel and surrounding country. In the centre of the town is the market-house and town-hall, with an old structure called the Ypres Tower, occasionally used as a gaol. A public library is supported by subscription, and there is a small theatre. The church is a large cruciform structure, with a central tower, partly of Norman and partly of early English architecture: the aisles of the choir have fine lancet windows, and there is a large and fine perpendicular E. window. The living is a vicarage, in the gift of the Earl of Burlington. The Wesleyan Methodists, Independents, and Baptists, have their respective places of worship, with attached Sunday-schools; and it has a small endowed grammar-school,

an English school, with several almshouses and other charities. "There is no manufactory in the town, which depends upon being the port and market through which the surrounding rich agricultural district is supplied. Some years since it is said to have been in a declining condition; the reverse, however, is now the case, and it appears to be, indeed, in an eminently thriving state. This is mainly attributable to the improvements lately made in the harbour and in the navigation of the river, which have made the town accessible to vessels of 200 tons. By means of the Rother and its branches it supplies the surrounding country to a distance of 8 m. with coals and other articles; and there is a project in contemplation to extend the navigation as far as Robert's Bridge, a distance of 15 m. in a straight line. This, if carried into execution, will be a source of considerable advantage to the town, which will then become the port through which the country, as far as Battle, will be supplied." About 90 vessels of the aggregate burden of nearly 5,000 tons belong to the port; and in 1840 the gross customs' tons duties amounted to 6,790. The exports are chiefly wool, oak timber, and bark. A considerable quantity of hops is raised in the neighbourhood, for the drying of which large quantities of Welsh coal are annually imported. (*Mun. Bound. and Corp. Rep.*)

Rye is a bor. by prescription, and is governed under the Municipal Reform Act, by a mayor, 3 other aldermen, and 12 councillors, styled "the mayor, jurats, and commonalty of the ancient town of Rye." Corp. revenue in 1839, 429½, exclusive of 86½ accruing from the sale of property. Courts of session are held under a recorder; and there is a court for the recovery of debts under 40s. Rye returned 2 mems. to the H. of C. from the 42. Edw. III. down to the Reform Act, which deprived it of one of its members, and at the same time enlarged the electoral limits, so as to comprise with the old bor. the rest of the par. of Rye, the town and par. of Winchelsea, with six other entire parcs, and a small portion of the par. of Brede. Reg. electors in 1839-40, 524. Markets on Wednesday and Saturday; fairs, Whit-Monday and Aug. 10.

Rye is very ancient, but its early history is little known. It appears to have been an original Cinque Port, and is mentioned as a member of these ports in a charter granted by Henry III. In the reign of Edward III. the town was so considerable, that it sent 9 armed vessels to the royal fleet when the king undertook the invasion of France. In the next reign, A.D. 1377, it was plundered and burnt by the French, but it soon recovered its consequence. The rise of other ports on the same coast during the last century, and the filling up of its port, occasioned a considerable decrease of its importance, which, however, as above seen, it has now a fair prospect of in some measure recovering.

## S.

SACKETT'S HARBOUR, a village or town and port of entry of the U. States of N. America, state New York, co. Jefferson, on a bay at the E. end of Lake Ontario, at the mouth of Black River, 41 m. N.E. Oswego, and 150 m. N.W. Albany. This is a prosperous, rapidly increasing town: in 1835 it extended a mile along the bay, and had three places of worship, several schools, stores for all goods in ordinary demand, a steam-engine factory, saw and other mills, barracks for the accommodation of 2,000 men, and many dwellings substantially built of limestone, &c. We have no late account of the pop., which, however, we understand may be taken at about 7,000. The harbour is the best on the Lake, and is used by the American government for ship-building, and as a naval dépôt. A peninsula juts out from the lower extremity of the town, forming an inner and outer harbour, the latter of which has water sufficient to float the largest ships of war, within 2 fathoms of the shore. Near the mouth of Black River is another equally good port; and vessels of the largest class are built at both. A considerable trade is carried on from this port by the Lake and the St. Lawrence; and by the Oswego, Erie, and Welland canals. Numerous vessels for the navigation of the lake are built here; and water sufficient to work machinery has been brought to the village by a canal from Black River, 1 m. in length, and constructed by the inhabs. at a cost of 25,000 dollars. (*New York Gaz.*)

SAFFI, AZAFFI, or ASFI (sm. *Saffi*), a city and seaport of Morocco, prov. Abda, on the Atlantic, near Cape Cantin, and 96 m. N.W. Morocco. Pop. estimated at 12,000, including about 3,000 Jews. (*Græberg of Hemsö*.) It is built in a sterile ravine between two hills; being very hot in summer, and disagreeable in winter, "as the waters from the neighbouring mountains, occasioned by the rains, discharge themselves through the main street into the ocean, deluging the lower apartments of the houses." (*Jackson*.) It has thick and high walls, and a

neat palace, formerly the occasional residence of the emperor's sons; a little way N. of the town is a small fort. Its roadstead is safe in summer, but in winter, when the winds blow from the S. or S.W., vessels are obliged to run to sea; which they have been known to do several times in the course of a month, while taking in their cargoes.

Saïd was formerly an emporium of the European trade with Morocco, but its commerce has declined with the rise of Mogadore; on the foundation of which, in 1760, the emperor ordered the removal thither of all the merchants of Saïd. The Moorish and Bedouin inhabs. are fanatical and intolerant, and said to be inimical to Europeans, with whom, however, they have now little intercourse. In the environs are many Mohammedan sanctuaries. This city is supposed to have been founded by the Carthaginians. In modern times, it belonged to the Portuguese, from 1508 till 1641. (*Graberg of Hems, Specchio di Morocco; Jackson's Morocco, &c.*)

SAFFRON-WALDEN (an. *Saffron-weald-den*, "the woody hill abounding with saffron"), a municipal bor., market-town, and par. of England, co. Essex, and hund. Uttlesford, 23 m. N.W. Chelmsford, and 37 m. N.N.E. London. Pop. of mun. bor., in 1831, 4,350. The town, in a valley close to a tongue of high land, surmounted by the church, comprises several good streets and a spacious market-place, with a neat town-hall. Many of the houses are good, and the place generally bears an appearance of neatness and comfort. The church, which stands so high as completely to overtop the town, is an elegant structure in the perpendicular style, with an embattled tower at its W. end; the living, a vicarage in the gift of Lord Braybrooke, is worth 237*l.* a year. The Independents, Baptists, Unitarians, and Friends, have each places of worship. A free grammar-school, endowed by Edward VI., has an exhibition at Queen's College, Cambridge; but the education is now conducted on the national plan, and connected with it is a girls' school, the whole furnishing instruction to about 250 children of both sexes. There are likewise several Sunday-schools, some almshouses lately rebuilt, and various other money charities. Saffron-Walden has several large malting establishments, and enjoys a good retail trade for the supply of the numerous wealthy families in its vicinity; besides which it has well-attained markets for corn, cattle, and provisions. The neighbourhood is extremely productive, and well cultivated; but the growth of saffron (whence the name of the town) has been abandoned. The bor. was incorporated by Edward VI., in 1542, and is governed, under the Mun. Reform Act, by a mayor, 3 aldermen, and 12 councillors. Corp. rev., in 1839, 147*l.* 19*s.* Petty sessions for the hund. are held every alternate week, and there is a court for the recovery of debts under 10*l.* Saffron-Walden is also one of the polling places at elections for the N. div. of Essex, and the principal town of a poor law union, embracing 24 pars. Markets on Saturday; fairs, for horses and cattle, Saturday before Midlent Sunday, and Nov. 1.

SAGHALIEN. See JAPAN.

SAHARA, or the great central Desert of Africa. (See AFRICA, I. 22.)

SAID (an. *Sidon*), a town and sea port of Asiatic Turkey, celebrated in remote antiquity as one of the greatest emporiums of the Mediterranean, and as being the parent city of Tyre. Its modern representative is seated on the N. side of a cape extending into the Mediterranean, 22 m. N.N.E. Tyre, 20 m. S.S.W. Beyrouth, and 55 m. W. Damascus; lat. 33° 34' 50" N., long. 34° 22' 40" E. Pop. estimated by Mr. Robinson at from 4,000 to 5,000 only, of whom more than half are Christians of the Greek church. Olivier says, "Sidon may be compared with Beyrouth as to its pop. and extent, and its streets are equally irregular and filthy; but its situation is more pleasant and advantageous, its houses are better built, and it has *khans* (hotels or private residences) of considerable extent, and which would not disgrace any city of Europe. Most of these have their own fountains, independent of those distributed through the town. The Aula supplies Said with water, which is brought from it by a channel kept in ill repair, for a distance of more than a league." (*Voy. dans l'Emp.*, Oth. iv. 58 transl.) The streets in the upper town, which stand upon an acclivity, are narrow and gloomy, being arched over in many places, like those of Jerusalem. The lower part of the town is more cheerful. The bazaars are well supplied, especially with leather goods. (*Robinson's Syria, &c.*, i. 269-270.) Most of the houses have gardens attached. On the land side the town is defended by a high wall, now partly in ruins, as well as by a fortress, on a hill to the S., said to have been constructed by Louis IX. of France. There are several mosques, both within and without the town. It has been generally supposed that the ancient city was about 2 m. further inland, and, like many other maritime cities of antiquity, at some distance from the sea-shore, on which its port was situated. The non-existence of any antiquities worth notice at Said seems to favour this opinion; while, at a place

called Old Sidon, at about the distance above stated, some traces of ancient walls and other buildings are still discoverable.

There can, however, be no doubt that the harbour on the N. side of the present town was the port of the ancient as well as the modern town. Here is a quay formed of very thick walls, in parts of which a tessellated pavement of variegated marbles, with representations of animals, festoons, &c., still exists in tolerable preservation. Many granite columns are also wrought into the walls, and others stand as posts to a bridge of several arches, which runs from the main quay to a castle built in the sea, by Fahr-ed-Din, the celebrated emir of the Druses, in the 16th century. The latter, aiming to render himself independent of the Porte, not only fortified Said, but, in order to make its harbour inaccessible to Turkish galleys, choked it up by sinking boats filled with the debris of ancient buildings. This measure gave a severe blow to the commerce of the town, the roadstead being so insecure that scarcely a fisherman's skiff can lie in it safely. (*Bowring's Report*); but even at the end of the last century, the French merchants of Said had a considerable trade with Marseilles, to which they exported cotton, silk, and woollen goods, fruits, corn, oil, scammony, galls, soda, and wax. At present the principal resources of the inhabitants are derived from dyeing, and from the manufacture of leather and silk goods.

Sidon is first mentioned in Gen. x. 15, 19; and appears to have risen into importance at a very early period, since it is spoken of in Joshua as the "great Zidon;" (ch. xi. 8.; xix. 28.) In the division of Palestine it was allotted to the descendants of Asher, but we learn from Judges, i. 31, that it never came into the actual possession of that tribe. Its inhabitants were anciently eminent in ship-building, and were employed by Solomon in the construction of the Temple, there being, among the Jews, none who had "skill to hew timber like unto the Sidonians." Pliny states that it was also famous for its glass manufactures. In its commercial importance, it appears, however, to have been early eclipsed by Tyre, and afterwards generally followed the fortunes of that city. In the middle ages, during the Latin kingdom of Jerusalem, it was a lordship, and an episcopal see under the Tyrian primacy. The crusaders, who lost it in 1111, recovered it from the Saracens in 1150; but were finally obliged to surrender it to the latter in 1289. In its neighbourhood is the convent of Mar-Elias, the residence of the late eccentric Lady Hester Stanhope. (*Robinson's Syria and Palestine*, i. 268, 273.; *Olivier, Voyage en Syrie*, ch. ii.; *Bowring's Report on Syria*; *Mod. Trav.*, vol. ii., &c.)

SAI-GON, a city, river-port, and the chief emporium of the empire of Anam, prov. Tsiampa, of which it is the cap., on the river of its own name, about 50 m. above its mouth; lat. 10° 47' N., long. 107° 5' E. Pop. loosely estimated at 180,000, among whom are many Chinese. It consists of two distinct towns, about 3 m. distant from each other, though the intermediate road be lined all the way with straggling houses. Pinghe, which has the citadel, and is the seat of the governor, is on the W. bank of the great Sai-gon river; whereas Sai-gon proper, the main seat of commerce, is on a smaller river, which, however, is navigable for good sized boats. The two towns are nearly of like size. The streets, which are regular, and intersect each other at right angles, are in some instances of great width. Along these, or along canals, many of which traverse the city, the houses are disposed in straight lines, and close to each other. They are built chiefly of mud, enclosed in bamboo frames, and plastered; sometimes they are tiled, but more frequently thatched with palm-leaves or rice-straw; they have seldom more than one story; but some of the better sort are surrounded with an open court-yard, with a gate towards the street. In Sai-gon proper, some of the streets are paved with flags; and quays of stone and brickwork extend nearly a mile along the river. The citadel, in Pinghe, constructed by a French engineer in 1799, has not been completed. It is a quadrilateral fortress, with earth ramparts, bastions, horn-works, a regular glacis, esplanade, and dry ditch. When Mr. Crawford visited the city, no guns were mounted on it, though there were several French cannon in the arsenal; and at present it is not capable of a regular defence. The interior, which is neatly laid out, has barracks, officers' quarters, and the governor's residence. In the N.E. part of the city, on the bank of a deep creek, are the naval yard and arsenal, one of the most complete establishments in the empire, where many good junks and war-boats have been built. The rice magazines, the naval arsenal, and the royal palace, a brick edifice, are the other principal public buildings. Sai-gon communicates with the Cambaja river by a canal 23 m. in length, about 80 ft. in width, and 12 ft. in depth. Its foreign trade, which is principally with China and Siam, is much less considerable than that of Bangkok. The principal articles exposed for sale in the shops are Chinese earthenware,

gills, paper, tea, &c. A few glass bottles and some bread coats may be met with, but scarcely any other European goods. The markets are well supplied with poultry, hogs, oxen, &c.; and the flesh of other animals less suited to a European taste, as dogs and alligators. Fruit is in great abundance, and the variety and excellence of the fish can hardly be surpassed. According to Mr. Crawford, Sal-gou is far preferable as a place of residence to Bankok. Its vicinity is well cultivated with rice, areca palm, &c. (*Crawford's Embassy to Cochinchina*, i. 317—348; *White's Voyage*, &c.)

SAINTES (an. *Mediolanum* aff. *Santonnes*), a town of France, dep. Charente-Inferieure, cap. arrond., on the Charente, here crossed by a stone bridge, 39 m. S.E. La Rochelle. Pop. in 1836, ex. com., 7,823. Its situation is good, and it is entered from the S. by a finely planted promenade; but it is ill laid out, and is for the most part, badly built. It has, however, some remarkable public buildings, and antiquities. The cathedral was founded by Charlemagne; and the tower, with the principal entrance, is said to have belonged to the original edifice; but the rest of the structure dates principally from the 16th century. The church of St. Eutrophius has a fine steeple, constructed under Louis XI. A celebrated abbey was founded here in 1043, into which Eleanor of Guenne retired, after her divorce from Louis-le-Jeune; its buildings are now converted into cavalry barracks. The sub-prefecture, formerly the bishop's palace; the hospital, originally the seminary; the Protestant church, hall of justice, public library, and theatre, comprise the other chief public buildings. It has cabinets of natural history and antiquities, a communal college, and departmental nursery grounds; and manufactures of hosiery, earthenware, dyeing-houses, tanneries, &c. Saintes is in the centre of a district, furnishing the best Cognac brandy; in which, and in corn and wool, it has a large trade.

Under the Roman, *Mediolanum* was one of the chief cities of Aquitaine. Some Roman baths exist on the banks of the river; and without the walls, are the remains of an amphitheatre, almost as extensive, though not nearly in such good preservation, as that of Nîmes; adjacent to the bridge is a triumphal arch dedicated to Tiberius Drusus and Germanicus (*Guide du Voyageur*); and the ruins of an aqueduct, a circus, &c. are still traceable. Saintes was the cap. of the dep. Charente-Inferieure, from 1790 till 1810. (*Dict. Géog.*)

SAINT HELENA. (See St. HELENA, and so for all the other articles having the prefix of Saint.)

SALAMANCA, (an. *Salamanca*), a celebrated city of Spain, kingd. of Leon, and prov. of its own name, on the Tormes (a trib. of the Douro), crossed here by a handsome stone bridge of 27 arches, 92 m. S. by W. Leon, and 119 m. W.N.W. Madrid. Pop., according to Miliano, 13,918, not including the clergy and university. It stands on three small hills, and is surrounded by walks: streets generally steep, narrow, and crooked, extremely dirty, and with a decayed melancholy aspect. There are numerous public places and fountains; but the only one worth notice is the *Plaza mayor*, a fine square, each side of which is 293 ft. in length, surrounded by houses of three stories, all of equal height, and exact symmetry, with iron balconies, surmounted by a stone balustrade: the lower part is open, forming a colonnade running all round the square. Bull-fights are exhibited here in June. Among the public edifices, by far the largest is the cathedral, a Gothic building with a superfluity of carving on the exterior; it is 378 ft. in length, and 181 ft. in breadth, the height of the nave being 130 ft. In the interior are some good paintings, and a fine organ with horizontal pipes. The chapter comprises a bishop, 10 dignitaries, and 26 canons. The city has also 25 par. churches; but few of them merit description. The church of St. Stephen, however, which was formerly attached to a Dominican convent, may almost vie in splendour of decoration with the cathedral itself. Salamanca has, for many centuries, been celebrated as the seat of a university, and the numerous buildings belonging to the various colleges constitute a principal feature in the city: indeed, so proud are the Spaniards of the collegiate edifices of Salamanca, that they somewhat pompously termed it *Roma la chica* (little Rome). The university was founded in 1239, and enjoyed a revenue, in 1826, of 1,200,000 reals, or 12,500 sterling; though this has since been much diminished by the suppression of the convents, and the application of their funds to secular purposes. In the 15th and 16th centuries, the university of Salamanca was attended by from 10,000 to 15,000 students; but its former glory is departed, and we question whether it have now 300 pupils. Nor is this to be at all regretted, for what advantage could any one derive from the prelections of Spanish churchmen on monkish literature, the philosophy of Aristotle and Thomas Aquinas, Roman jurisprudence, and the canon law? Attached to the university is a large library, furnished with a few modern books and piles of scholastic divinity.

Vol. II.

Formerly there were 4 public and 25 private colleges connected with the university; but many of these have now fallen to decay, and the buildings are little better than mere ruins; indeed, but few of them retain any traces of their former magnificence, their most valuable effects having been carried off during the Peninsular war, and the monastic libraries were burnt by wholesale in 1808. Before the suppression of the monasteries, Salamanca had 580 clergymen; and before the coffers of the churches and convents were emptied to supply the wants of the state, ample provision was made for the support of idleness. Every street swarmed with vagabonds, not merely those who were proper objects of compassion, but those also who, if compelled to work, would have been found abundantly able to maintain themselves. Mendicancy still prevails; but the want of public support must eventually compel the mendicants to apply themselves to industrious callings.

The manufactures of Salamanca are inconsiderable, comprising some fabrics of broad-brimmed hats (*sombreros*), several tanneries, two or three establishments for weaving woollen cloth, and a few others for making starch, glue, earthenware, &c., besides a pretty large manufacture of shoes. A weekly market is held here, and an annual fair in September. The suburbs abound with well-planted walks; the *huerta*, or irrigated tract near the river, is planted with fruit trees; corn, and leguminous plants abound throughout the neighbourhood (the husbandry of which, according to Townsend, is superior to that in most parts of Spain), and the hills, clothed with oak trees, are depastured by oxen, sheep, and goats, celebrated for the delicate flavour of their meat.

Salamanca, though mentioned by the classical writers under the name of *Salmantica*, appears to have been of little importance under the Romans, though a Roman road and some other monuments are still extant. Salamanca is celebrated in the history of the late Peninsular war for the victory gained in its vicinity on the 22d July, 1812, by the Anglo-Portuguese army, under the duke of Wellington, over the French, under Marshal Marmont. The struggle was most severe; but the British were successful at all points. (*Twiss's Spain and Portugal*, p. 58—63; *Townsend's Spain*, ii. 73—88; *Milano; Dict. Géog.*; *Encycl. Metrop.*; *Napier's Peninsular War*, iv. 168.)

SAANKEMENT, a small village of the Austrian dominions, prov. Slavonia, on the Danube, nearly opposite to the embouchure of the Theiss, 23 m. E. by S. Neusatz. It deserves notice from its having been the spot where the first decisive check was given to the progress of the Turks. A powerful army of the latter, commanded by the justly celebrated Vizer Kuperli, was encountered here on the 19th of August, 1691, by the Imperialists, under Prince Louis of Baden. After an obstinate and well-contested action, without any decisive advantage to either party, Kuperli fell; when the Turks, panic-struck by his loss, were totally defeated, leaving above 20,000 men on the field of battle. The loss of the Imperialists did not exceed 8,000 men. (*La Croix, Abrégé de l'Histoire Ottomane*, anno 1691.)

SALEM, a town or city, and sea-port of the U. States of N. America, state Massachusetts, co. Essex, on a tongue of land projecting into the sea, and forming two inlets called N. and S. rivers, 18 m. S.E. Newbury Port, and 18 m. N.E. Boston, with both of which it is connected by railways. Lat. 42° 34' N., long. 70° 54' W. Pop., in 1821, 13,886. Though not regularly laid out, it is well built, and healthy; and, with respect to pop., commerce, and wealth, is one of the first towns in New England. It has an Athenæum, with a good library, a valuable museum, belonging to the E. I. Marine Society, numerous banks, insurance offices, charitable institutions, schools, &c., a custom-house, and various public buildings, most of which are substantial brick edifices. The goal is of stone, commodious and spacious. In the centre of the town is an enclosed common, comprising about 10 acres, partially planted with trees. The harbour, formed by South River, has good anchorage; but vessels drawing more than 12 or 14 ft. water have to be lightened at a distance from the wharfs. On Baker's Island, at the S. side of its principal entrance, are two light-houses, the being 117 ft. and the other 126 ft. above the level of the sea. The town and harbour are protected by two forts. The inhabs. of Salem have long been very largely engaged in the India and China trade, and both their foreign and coasting trade is still considerable. They have also recently engaged in the whale fishery. There belonged to the port, in 1839, 34,468 tons shipping. A bridge, upwards of 1,500 ft. in length, across N. river, connects Salem with Beverly, a town of about 5,000 inhabitants, engaged in similar pursuits. Next to Plymouth, Salem is the oldest town in Massachusetts, having been founded in 1626. (*Encyc. of Geog.*, Amer. edit.; *Blunt's American Coast Pilot*; *Offic. Tables*.)

SALEM, a district of British India, presid. Madras, between the 11th and 13th degs. of N. lat., and 77° and 80

degs. E. long.; having N.E. and E. N., and S. Arcot; S. E. and S. Trichinopoly; S.W. and W. Coimbatore, from which it is separated by the Cavery; and N.W. the Mysore territory. Area, 6,518 sq. m. Pop., in 1836-7, 905,190. Its whole surface is above the E. ghauts; and its climate is cool and bracing, which makes it be much frequented by European Invalids. It comprises the Barramahli districts, a rich table-land forming its N. portion. Except the Cavery, and Ponlar, it has few rivers, and no lakes. In 1836, of 4,178,870 acres, 1,118,720 were estimated to be under culture; exclusive of 661,500 ft. for cultivation, and 2,391,650 acres that were barren and mountainous. About three fourths of the land is assessed under the ryotwar, and the remainder under the zemindar system. Rather more than half the pop. is supposed to be actively employed in agriculture. Maize, rice, and a little cotton are grown, and great quantities of teak, sandal, and black woods grow on the hills; but the principal exports are cloth, ghee, tamarinds, turmeric, jagghery, oil seeds, and iron. Iron ore is very abundant, and good steel is made. Cloth is, however, the staple commodity, and is manufactured for export to the W. Indies and America. The chief imports are areca nuts, silk, and black pepper. Total revenue of the district, in 1837-8, 1,950,563 rup.; of which sum, 1,625,32 rup. were contributed as land tax. Salemi, the chief town, and residence of the British authorities, stands in about lat. 11° 37' N., long. 78° 13' E. It has some trade in cotton cloths, saltpetre, &c. (*Madras New Almanack; Hamilton, E. I. Gaz.*)

SALEMI, a considerable town of Sicily, intend. Trapani, cap. cant., on a hill, 20 m. E. Marsala. Pop., in 1831, 12,162. It is finely situated, but has a most abject appearance. Its inhabs. are indolent, and the town has no trade, being, according to Russell (*Trav.*, p. 61.), distinguished only by filth and superstition. Salemi occupies the site of the anc. *Halycia*. Sir R. C. Hoare supposes that it derives its present name from a Saracen chief of the 9th century. (*Classical Tour in Sicily*, ii. 85.)

SALERNO (an. *Salernum*), a celebrated city and sea-port of S. Italy, in the Neapolitan dom. prov. Principato Citra, of which it is the cap.; at the foot of a hill on the N.E. shore of the Gulf of Salerno, 17 m. S.S.W. Avellino, and 28 m. S. E. by E. Naples, with both of which cities it is connected by good roads. Lat. 40° 41' N.; long. 14° 46' E. "The modern city, with 16,000 inhabitants, is by no means well built; and the narrow and dirty streets, running on different levels from the immediate edge of the sea, some way up the mountain, give its interior a gloomy appearance, and afford but inconvenient residences; but its situation is most happy, and a marina, or promenade, which skirts its whole length along the shore, was added by the French, and contributes to render its aspect from the sea extremely imposing. There is no port; though a broken mole, affording protection to the smallest vessels only, offers the semblance of such an accommodation." (*Craven's Tour*, &c., pp. 369, 370.)

The principal square has a good public fountain, and is surrounded with several Gothic edifices, including the intendancy, the new theatre, and the cathedral. The houses are lofty, and the streets paved with lava. Ancient Gothic walls, in tolerable repair, enclose the city; and on the hill above, amid the principal remains of the ancient Salernum, is a ruined citadel. The cathedral, a heavy Gothic structure, is the most interesting of its public edifices. It was erected by the Normans on the site of an ancient building, and is dedicated to St. Matthew, who is said to be buried within its walls. "The atrium, or court before it, is spacious, and surrounded by a portico of antique columns of porphyry, granite, &c. (said to have been brought from Pæstum 23 m. S.E.E., by Robert Guiscard); upon which the Normans constructed a range of brick arches, bent more after the Saracenic than the Gothic or Grecian manner; these support a regular set of apartments. In the centre is a basin of granite, 15 ft. in diameter, constantly filled by a fountain of excellent water. Many excellent sepulchres are placed in the colonnade, and the church contains also some monuments of remarkable personages, as Roger and William, dukes of Apulia, Margaret of Durazzo, and the restless pontiff Gregory VII., who died of chagrin at Salerno, in 1085. On each side the entrance of the choir is a pulpit raised upon pillars. Their pannels are formed by rich mosaic of many colours, disposed in knots and stars. The choir is inlaid with square and oval plates of verde-antique, porphyry, and serpentine; the great altar is decorated in the same barbarous, but splendid manner." (*Swinburne's Tour*, ii. 119.) Though the cathedral has but few paintings, it has, luckily, an ample supply of miraculous images! There are numerous other churches, one of which is said, but on doubtful authority, to be the burial-place of John of Procida, a native of Salerno, celebrated as the principal contriver of the conspiracy against the French in Sicily, which terminated on the 30th of

March, 1289, in the massacre known by the name of the "Sicilian Vespers." Salerno has two hospitals, a work-house, three government pawn-banks, a seminary, a royal lyceum, and a university. To the last belongs a school of medicine, which was once among the most famous in Europe, but which has, for a lengthened period, lost its pre-eminence. But the lyceum in this town is said to be superior to most others in the kingdom.

Salerno is an archbishop's see, the residence of the provincial intendant, and the seat of a superior criminal court, and of a civil tribunal. Previously to the period when Naples attained to a decided lead among the cities of S. Italy, Salerno carried on a considerable commerce by sea; that, however, has now wholly disappeared, though it continues to possess a pretty extensive inland trade, and has two large annual fairs.

Its climate is mild; but it is unhealthy from the proximity of marshes and rice-grounds, the culture of which occupies many of the inhabs. It is doubtful whether the ancient Salernum was contiguous to or at some distance from the sea; but, on the whole, the probability seems to be that it did adjoin the sea, or that it was within such a short distance of it as to justify its being reckoned among maritime towns. (*Celtariz, Geographia Antiqua*, l. 860.) After the fall of the Roman Empire, Salerno became the cap. of a flourishing republic, the sovereignty of which was contested by the Greeks, Saracens, Lombards, and Normans; the latter of whom obtained possession of the city in 1076. Having been mostly burned down by the emperor Henry VI., it subsequently became a feudal possession of the Colonna, Orsini, and Sanseverini families, till it was re-annexed to the royal domains by the emperor Charles V. (*Rampoldi; Craven; Swinburne; Eustace, Classical Tour*, iii. 85.)

SALINS, a town of France, dép. Jura, cap. cant., in a narrow valley on the Furieuse, 26 m. N.E. Lons-le-Saulnier. Pop., in 1836, ex. com., 6,185. It is walled, and commanded by two forts on adjacent heights. Its principal street is paved, and lined with substantial houses. There are several churches, a spacious college, a public library, good barracks, a theatre, hospital, and prison; these buildings are nearly all new, the town having been almost wholly destroyed by fire in 1825. Salins has several iron-forges, stone works, and brandy distilleries; but its name and principal importance are derived from its brine springs, which were wrought in the time of the Romans. They occupy a large space in the middle of the town, inclosed by turreted walls. According to Hugo, the produce amounts to 140,000 cwt. of salt a year; in addition to which a considerable quantity is made at Arc, about 4 leagues distant, to which an aqueduct conducts a portion of the water of the Salins springs. (*Hugo; Dict. Géog.*)

SALISBURY, or NEW SARUM, a city, parl. bor., and market-town of England, co. Wilts., of which it is the cap., hund. Underditch, on the Avon, here crossed by 3 stone bridges (one of which has 10 arches), 21 m. W. Winchester, and 80 m. W.S.W. London. Parl. bor., which includes, with the city, the extra-parochial district of the Cathedral Close, and parts of par. Fisherton and Milford, in 1831, 11,672. It is built with great regularity, having 6 principal streets running from N. to S., crossed by the same number, intersecting them nearly at right angles. The houses generally are large and respectable, some, also, laying claim to considerable architectural elegance. It is well paved, lighted with gas, and kept remarkably clean by means of brooks running down the middle of the streets. The market-place, a large open square on its W. side, has, at its S.E. angle, the council-house, a brick structure, with a Doric portico, erected at the close of the last century at the expense of the Earl of Radnor, and since greatly enlarged. The interior is divided into court-rooms, offices, &c. for the business of the assizes, quarter-sessions, and corporation, and it has several good modern portraits. On the opposite side of the market-square is a curious old hexagonal-shaped building, having a conical roof supported by pillars; it is called the Poultry or Butter-cross, and was probably built in the reign of Edward III. In another part of the same square is the public library and reading-room, founded in 1819, and supported by subscription. The most striking feature in Salisbury, however, is its cathedral, which stands in the large open space called the Liberty of the Close, on the S. side of the city. The situation is remarkably good; the precinct or close is kept in the best order, and comprises some very fine trees, which, as well as those in the palace-grounds, serve to embellish the views of the cathedral. The W. front, the N. side, and the E. end of the latter are all open, and may be seen from peculiarly favourable distances: indeed, the N.E. view is perhaps the best general view of a cathedral to be had in England, and displays the various portions of this interesting edifice to the best advantage. Salisbury cathedral has the advantage of being built in one style, the early English, and on

a uniform and well-arranged plan. The centre tower and spire (the entire height of which is estimated at 404 ft.) are of later date, but admirably accommodated to the style of the building. The plan is that of a complete cathedral, having spacious cloisters, an octangular chapter-house, and a tower for a library and muniment room: there are 2 transepts: each of which has an aisle eastward, and the nave has a large N. porch. The extreme length of the church (including the Ladye chapel) is estimated at 474 ft.; breadth of nave and aisles, 78 ft.; height of nave, 30 ft.; and width, including the great transepts, 210 ft. Modern alterations have taken away the altar-screen, and thrown the Ladye chapel open to the choir: the organ-screen, also, as well as a large portion of the tabernacle-work in the choir, is of modern construction. The E. window is filled with a beautiful painting on glass of the Resurrection, from the designs of Sir Joshua Reynolds; another window exhibits a painting on glass of the Elevation of the Serpent in the Wilderness: there are other painted windows, and in various parts of the church are several ancient monuments, some of which are extremely curious. The W. front is a beautifully enriched specimen of the pointed architecture, peculiar to this church: the angles are terminated by tolerably massive square towers, surmounted by spires and pinnacles; and over the grand central entrance is a series of canopied arches, beneath the great W. window, which is formed in three divisions. The exterior of the church is enriched with a number of recesses situated in tiers at different heights all round the building. Many of the statues still remain, and it is supposed that originally there must have been at least 200. The cloisters are remarkably magnificent, forming an exact square, each side of which is 182 ft. in length. The cathedral library is built over the E. side of the cloisters, and adjoining them, in the same direction, is the chapter-house. "On the whole," says Mr. Rickman, "the cathedral presents an object for architectural study hardly equalled by any in the kingdom: the purity of its style and the various modes of adapting that style to the purposes required, deserve the most minute attention." (*Rickman's Gothic Architecture*, p. 257, 258.)

Within the close, formerly surrounded by a wall, and still entered by several ancient gates, deserving admiration, are the residences of the bishop, dean, canons, &c. The deanery-house is opposite the W. front of the cathedral; and at a little distance S.E., surrounded by gardens, is the bishop's palace, a very irregular building, in different styles of architecture, having been enlarged and repaired at various periods, from the middle of the 15th century down to a recent period. The gardens are on a large scale, comprising an area of several acres, well planted with fine, large old trees. The episcopal see was removed from Old Sarum to Salisbury under the authority of a papal bull, in 1217, about which time the cathedral was founded, the expense of its erection, exclusive of the chapter-house, tower, and spire, being estimated at 40,000 marks, or 26,667l., an enormous sum in those days. The chapter comprises (besides the bishop) a dean, precentor, chancellor, and six canons residentiary, dividing among them a net revenue of 2,800*l.* annually, and having residences and separate revenues, with the patronage of 18 benefices. There are likewise 31 prebendaries, better called vicars, &c. At an average of the three years ending with 1831, the revenues of the bishopric amounted to 3,939*l.* a year; but it either has been, or is to be augmented to 5,000*l.* a year. The bishop has also a large portion of the cathedral-patronage, besides that of 36 benefices; his diocese extends over the whole of Wiltshire and a portion of Shropshire. Salisbury has three other churches, one of which, St. Edmund's, is in the gift of the bishop, and that of St. Thomas's in the patronage of the dean and chapter. St. Edmund's is a perpendicular structure, with large windows and good tracery, the chancel having been modernized. The tower fell down, and was rebuilt in the 17th century. St. Thomas's is a large perpendicular church of good composition, with its tower standing on the S. side of the S. aisle: it has a nave and chancel, with aisles and a clerestory. St. Martin's is a large church, in the early English style, with some more recent parts. The church at Fisherton is small and of mixed architecture. The Roman Catholics have a handsome chapel; and there are places of worship for Independents, Baptists, Wesleyan-Methodists, and Unitarians, with attached Sunday-schools. A grammar-school is attached to the cathedral for the instruction of the choristers, and there is another in the city, founded by Queen Elizabeth, in the patronage of the corporation. The bishop supports a good school; and there is also an orphan school; and the different parishes have their respective national, infant schools, &c. There are several charities, among which may be mentioned that of Bishop Le Poor, near Harlham Bridge; Trinity Hospital, founded in the reign of Richard II., for 12 aged matrons; and Bishop Ward's college for clergymen's widows; with several other almshouses, money charities, &c. An infirmary,

founded near Fisherton bridge in 1768, is liberally supported by subscription; a mendicity society has been established with considerable success, and there are various minor benevolent institutions, bible, and tract societies, &c.

A county-gaol has been recently erected in Fisherton, and there is a small, but neat theatre, little patronised, with Assembly and Concert rooms. A weekly newspaper, called the "Salisbury and Winchester Journal," has a pretty extensive circulation. Races are annually held near the town in August. "The town of Salisbury cannot be considered as increasing, or in a state of improvement, having very little trade. An extensive woollen manufacture was formerly carried on here; but it is now confined to a single factory; and cutlery, for which this town was once famous, is now brought for sale from Birmingham." (*Parl. and Municipal Board. Report.*) It has hitherto derived some benefit from its position on one of the great roads to Devonshire; but the opening of the Western railway has deprived it of this advantage.

Salisbury received its first charter from Henry III., which was afterwards renewed by several monarchs. According to the Municipal Reform Act, it is divided into 3 wards, and governed by a mayor, 6 aldermen, and 18 councillors. Quarter and petty sessions are held under a recorder; besides which the assizes and quarter sessions for the co. are held here. A court for the recovery of debts to any amount is held monthly by the bishop's bailiff, who also holds courts-leet for the lord of the manor. Salisbury has returned 2 mems. to the H. of C. since the reign of Edward I., the right of election down to the Reform Act being vested in the corporation, consisting, in 1831, of 56 members. The limits of the par. bor. were enlarged by the Boundary Act, so as to include, with the old bor., the cathedral close, and certain parts of Fisherton and Milford parss., as before mentioned. Registered electors, in 1839-40, 698. Salisbury is also the chief election town for the S. division of Wiltshire. Markets on Tuesday and Saturday, with large cattle fairs on alternate Tuesdays. Fairs, Tuesday after Jan. 6.; Tuesday after March 25.; Whit Monday and Whit Tuesday for horses, and Oct. 29. for butter and cheese.

Salisbury owes its foundation to the removal of the ecclesiastical establishment from the once important but now decayed borough of old Sarum, the Roman station of *Sorbidunum*, about 2m. N. from the modern city. The quarrels between the troops of Henry II. and Roger Le Poor, the turbulent prelate of that day, induced the latter to establish his clergy in a more peaceful and advantageous situation: a city soon arose round the cathedral, and by the influence of the monarchs and clergy, soon became an important place, while the other fell to decay, and was ultimately deserted by its inhabs. Henry III. granted the city a charter, entitling it to the same privileges as Winchester, and conferring extensive local powers on the bishop of the see. Parliaments were occasionally held here during the 13th and 14th centuries. The city became celebrated, after the death of Charles I., for the abortive attempt of the royalists under Colonel Wyndham, to proclaim Charles II. Two large monasteries existed here prior to the Reformation; but there are no extant remains of these foundations. Among other distinguished individuals to whom Salisbury has given birth, may be specified James Harris, the author of the "Hermes," and of other learned and ingenious philological and metaphysical treatises, born here in 1709. Thomas Chubb, a clever, but not very learned, deistical writer of the last century, was also a native of this city. N.W. from Salisbury stretches the vast tract of downs and heaths, called Salisbury Plain; and about 6 m. N. of the city is the stupendous monument of Stonehenge, which see. (*Parl. and Mun. Reports; Rickman's Architecture*, &c.)

SALON, a town of France, dép. Bouches du Rhone, cap. cant., in a fertile plain within about 3 m. of the canal de Crapeanne, and 29 m. N.N.W. Marseilles. Pop., in 1836, 4,446. It is divided into an old and a new town, separated from each other by a planted boulevard. It has, according to Hugo, an air of opulence, of which many larger towns are destitute: its streets are regular, and it has many good houses and public buildings; including a church built by the Templars, the par. church, with several curious sculptures, town-hall, &c. On a rocky height, at the extremity of the town, is an old castle, now converted into a house of correction (or, according to Hugo, a barracks). It has manufactures of silk twist, hats, soap, and olive oil; and a brisk general trade. The remains of a temple in honour of Tiberius have been discovered here. (*Hugo, Dict. Géog.*, &c.)

SALONICA (an. *Thessalonica*), a celebrated city and sea-port of European Turkey, cap. sandjak of its own name, at the N.E. extremity of the gulph of same name, 185 m. N.N.W. Athens, lat. 40° 30' 47" N., long. 22° 57' 13" E. Its pop. was estimated by Mr. Walpole at about 42,000, by M. Beaujour at 60,000, and by later

though, perhaps, less cautious authorities, at 70,000, of whom about three fifths are Turks, and the rest chiefly Jews and Franks, with a few Greeks. Its appearance, when approached from the gulph, is very imposing, as it is seen from a great distance, placed on the acclivity of a steep hill, amid cypress trees and shrubs, surrounded by lofty white-washed walls ascending in a triangular form from the sea, and surmounted by a fortress with seven towers. The domes and minarets of numerous mosques rise from among the other buildings, and, being surrounded with cypresses, give an air of splendour to its exterior.

The circ. of the city walls probably exceeds 5 m.; but, according to Dr. Clarke, "a great part of the space within is void." (vii. 443. 8vo. ed.) Its interior presents the same irregularity, and many of the deformities common to Turkish towns; but, on the whole, as respects cleanliness and internal comfort, it may contrast favourably with most other places in Turkey of large size and pop. "The houses are generally built of unbaked bricks, and are, for the most part, little better than so many hovels." (Clarke.) Those of the principal inlubs, Greeks and Turks, have here, as in Yania, small areas connected with them, generally occupied by a few trees. The bazaars, at the lower end of the town, are very extensive, forming several long, but narrow streets shaded either by trellises with vines, or by projecting wooden sheds, with branches of trees thrown across. The dealers are principally Greeks and Jews; and the shops are well filled with manufactured goods and colonial produce; but in jewellery, shawls, and the richer articles of oriental dress, they appear inferior. Some of the mosques are worth notice from their size and antiquity, especially two which were formerly Greek churches. Another remarkable edifice, called the Rotunda, after having successively served as a heathen temple and Christian church, has been converted into a mosque: it has evidently been built on the model of the Pantheon at Rome. The cupola is adorned with mosaic work, appearing like a frontispiece of fine buildings, and in the dome is a circular aperture, as in that of the Pantheon. A fourth mosque has been formed out of a fine temple of the Thermæ Venus. This was originally a perfect parallelogram, 70 ft. in length and 38 ft. in width, supported on either side by 12 columns of the Ionic order, of the most exquisite proportions. The Greeks spoiled this beautiful building by endeavouring to make it cruciform; but the six columns of the *pronaos* remain; and M. Beaujour says, that if the Gothic disfigurements were stripped off, the original edifice would be found in the highest state of preservation, and would be reckoned one of the finest remains of antiquity. Among the other ancient structures are two triumphal arches, one of which, now forming a part of the city walls, was erected to Augustus after the battle of Philippi, and the other, of brick encased with marble, in honour of Constantine: on the piers of the latter are some fine groups in bas-relief, having a great deal of spirit. The Augustan gate, however (now called the Vardar gate, because it leads to the river of that name), is said by Dr. Clarke to be a work of superior taste. Its original height appears to have been 43 ft.; but the lower part, to the depth of 27 ft., is below the present surface: the span of the arch is 12 ft., and the masonry is of squared white marble blocks, having inscriptions and appropriate bas-reliefs. In the middle of the city is a magnificent ruin, called *Incantadas* by the Spanish Jews resident here, supposed to have been the *propylæum*, or entrance to a circus, consisting of 5 Corinthian columns, supporting an entablature on which are several figures much defaced, as large as life, and still exhibiting the traces of a master's hand. The castle, which forms a large area, separated by a rampart from the city, has lofty and well-built walls; and, at its highest point, stands the fortress surmounted, like that of Constantinople, by 7 towers, called by the Turks *Yedi-koule*, and by the Greeks *ἑπτὰ πύργους*. These towers, however, though occupying the site of the old acropolis, are comparatively modern, having been built by the Venetians.

Salonica, during that period of the late war, when the anti-commercial system of Napoleon was at its height, became an important depôt for British goods, whence they were conveyed to Germany, Russia, and other parts of Europe. They were transported on pack-horses, by long and laborious journeys, into the centre of Europe, through Bosnia into Austria, and through Bulgaria into different parts of Hungary, Transylvania, &c.; the time occupied in travelling from Salonica to Vienna being about 35 days. At all times, however, it has had a considerable trade, which, of late years, has rather increased, particularly as regards the importation of British cotton manufactures. The exports principally consist of silk and tobacco, wool, raw cotton, wheat, and other species of grain, linseed and hempseed, timber, nuts from Mount Athos, &c.; the entire value in 1837 being estimated at 136,614*l.*, while the imports for the same year (consisting principally of British manu-

factures, and colonial produce), were valued at 90,810*l.* The import-trade of the rayahs, most of whom are Jews, who purchase by firms the same commercial privileges as the Franks, is carried on by credits on Vienna, few of the importers having any capital; and orders to England are commonly paid for by drafts on Vienna, where the charge for credit is at the rate of 4 per cent. per annum. Goods are generally sold in the interior at an advance of 10 or 14 per cent. on the invoice cost, leaving a profit varying from 4 to 8 per cent. for the importer. We subjoin

AN ACCOUNT of the Number of Ships, with their Tonnage, and the Value of their Cargoes, that entered and left Salonica in 1837, specifying the Countries to which the Vessels belonged.

Countries.	Entered.			Cleared.		
	Vessels.	Tons.	Value of Cargoes.	Vessels.	Tons.	Value of Cargoes.
British	5	546	17,755	5	546	50
Maltese	3	393	17,755	5	393	1,305
Ionian	4	183	1,517	4	183	370
French	6	1,124	5,123	6	1,097	20,312
Austrian	15	2,299	9,096	15	2,629	6,452

Turkish	38	5,151	27,168	29	4,768	41,711
Total	329	25,192	90,809	306	23,275	136,614

The intercourse with England was a few years ago principally carried on through Malta by Maltese or Greek vessels; but the trade is now almost exclusively carried on in English bottoms. The ordinary import and export duties are those common to foreign trade in Turkey, viz. 3 per cent. *ad valorem*, being farmed by the Porte under certain restrictions to the pacha, or governor of the city. Salonica has no port; but there is excellent anchorage in the roads opposite the town, which, from the confinement of the gulph, are nearly landlocked. Accounts are kept in piastres of 40 paras, or 120 aspers, and the coins are similar to those of Constantinople (which see). The weights and measures are the same as those of Smyrna, except that the *kizloz*, or corn measure of Salonica, = 378 kizloz of Smyrna.

The commercial classes consist chiefly of Jews and Franks, the Greek pop. having greatly diminished since the war of independence. Salonica, however, is a metropolitan city, with 8 attached bishoprics, and there are numerous Greek churches. The Jews form an important section of the pop.: they are chiefly of Spanish descent, and obtain a livelihood by commerce and retail trade in the bazaars, those of the lower orders being employed as porters on the quays or in similar offices. The Franks, most of whom reside in the lower part of the city, consist almost exclusively of French and Genoese, who have establishments for the management of the transit trade. The situation is said to be unhealthy, especially in autumn, owing to the vicinity of the marshes at the head of the gulph: intermittent fevers are then exceedingly common, as well as chronic visceral complaints, the result of repeated attacks of those diseases.

Thessalonica was at first an inconsiderable town under the name of *Therma*, by which it was known to Herodotus, Thucydides, and Æschines. Xerxes stayed here some days with his army (*Herod.* vii. 128.), and it was occupied for a short time by the Athenians during the Peloponnesian war. According to Strabo (lib. vii.), Cassander changed its name to that of his wife Thessalonica, the daughter of Philip, and sister of Alexander the Great. After the conquest of Macedonia by the Romans it was made the capital of the second of the four districts into which that country was divided; it was the residence of Cicero during a part of the time he continued an exile. Valerian rested it to the rank of a colony; and it had an amphitheatre, a hippodrome, and numerous splendid public buildings. It is also extremely interesting from its connection with the early history of Christianity; having been visited by St. Paul, who made many converts, to whom he addressed the Epistles to the Thessalonians. (*Holland's Travels; Clarke's Travels*, vii. 441-478; *Morning Chronicle* for July 14., 1836; *Celtic*, *Geog. Antiqua*, i. 1044.)

SALOP, or SHROPSHIRE, an inland co. of England, having N. Denbigh, a detached portion of Flint, and Cheshire, E. Stafford, S. Worcester, Hereford, and Radnor, and W. Montgomery. Area, 859,520 acres, of which about 790,000 are supposed to be arable, meadow, and pasture. Aspect much diversified. No part of the surface is quite flat; but the great plain of Salop, or Shrewsbury, is comparatively level. It extends, lengthwise, from Whitechurch, on the confines of Cheshire, S. to Church Stretton, a distance of about 80 m.; and from Oswestry, on the confines of Denbigh, to Colebrook

Dale on the E., about 28 m. The Wrekin hill rises out of this extensive plain on its E. side. The S., or rather the S.W. parts of the co., contain several ranges of flatish square-shaped hills, divided by beautiful valleys. Soil various, but generally fertile. In the E. it consists of a red sandy loam, like that of Cheshire; in the S., a mixture of clay and loam is most prevalent; and in the W. there is a good deal of gravelly light soil. The harvest is said to be a fortnight earlier on the E. than on the W. side of the co.; a difference depending partly, no doubt, on the greater elevation of the ground on the W. side; but partly, also, on differences of soil. Salop is principally under tillage; but, in the S. and W., breeding and dairying are carried on to a considerable extent. A good deal of cheese, sold under the name of Cheshire, but inferior to the genuine article, is made in this co. The wool of the hilly tracts used to be of a peculiarly fine quality, but it has deteriorated during the present century in consequence of the efforts of the farmers to increase the size of the weight of the fleeces. The total stock of sheep in the co. is supposed to exceed 420,000; producing annually about 7,000 packs of wool. Hops are produced on the borders of Hereford. Property variously divided; some estates being very large, while there are many of very inferior degree of size. On the borders of Wales, farms very small, many not exceeding 20 acres; but on the E. side of the co., in the vicinity of Shifnal, Wellington, Newport, &c., they vary from 100 to 500 acres or more.

The district of Chlu Forest, in the S.W. part of the co., is divided into small freehold properties, varying in value from 5*l.* to 150*l.* a year, the majority being of the smaller class. Their occupiers, who, in most cases, are also the owners, employ few labourers, the principal part of the work on their farms being executed by themselves and their families. Leases less common now than formerly, and farms generally held from year to year. Agriculture improving; but, owing to the want of leases of a reasonable length, and with proper conditions as to management, it continues to be very defective. The number of corn crops, taken in succession, has been materially diminished since 1820; but two wheat crops still not unfrequently follow each other. These remarks do not, however, apply to the district on the E. side of the co. mentioned above; where the farms are large; for there the tenants are active and enterprising, and agriculture highly improved. Turnips extensively cultivated, and, for the most part, in drills; few oats grown. Cattle of mixed breed, and rather inferior. Pork and bacon much used by the people. Large flocks of turkeys raised by some farmers. Drainage in some places much wanted. Average rent of land, in 1810, 17*s.* 2*d.* an acre. Principal mineral products, iron, coal, lead, limestone, and freestone. With the exception of S. Wales, Staffordshire, and Lanarkshire, more than double the quantity of iron is made in this co. that is made in any other co. of the empire; the Salop furnaces having produced above 73,000 tons of iron in 1830, and above 100,000 tons in 1839. The furnaces are principally in Colebrook Dale, between Wellington and Witley. Excellent china ware, and a very superior species of pottery, are made at Coalport on the Severn and its vicinity; pipes, nails, &c., are made at Broseley; carpets at Bridgnorth; gloves at Ludlow, &c. Some branches of the flannel manufacture are carried on in Shrewsbury and its neighbourhood; but by far the largest portion of the flannel sold in its markets is brought from Merioneth and Denbigh. The Severn, which becomes navigable at Poole, co. Montgomery, traverses this co. in a S.E. direction, dividing it into two not very unequal portions; and it is besides intersected by very important canals. Roads formerly very bad, but now a good deal improved, though still susceptible of much amelioration. Salop is divided into 15 hundreds, or districts answerable to that denomination, and 216 pars. It returns 11 mems. to the H. of C., viz. 4 for the co., and 2 each for the bors. of Shrewsbury, Bridgnorth, and Wenlock, and 1 for Ludlow. Registered electors for the co., in 1839-40, 8,815, of whom 5,039 were for the N., and 3,776 for the S. division of the co. In 1831, Salop had 42,633 inhabited houses, 46,427 families, and 222,938 inhabitants, of whom 111,017 were males, and 111,921 females. Sum expended for the relief of the poor, in 1839-40, 55,022*l.* Annual value of real property, in 1815, 1,083,702*l.* Profits of trades and professions, in do., 279,933*l.*

SALSETTE, an island on the W. coast of Hindostan, prov. Arungabad, immediately N. of Bombay island, with which it is connected by a narrow causeway. Length 18 m., with an average breadth of about 13 m. Pop. loosely estimated at 50,000, about 1-5th of whom may be Portuguese Christians. There are two towns on the island, Tannah, and Gorabunder; the first being neat and flourishing, with a small fort, several churches, and a considerable British cantonment. The more remote interior parts of the island are inhabited by wild tribes, having no intercourse with the Hindoos of the coast; but who, being occupied as burners of charcoal,

bring it down to particular spots, whence it is carried away by dealers in the article, who deposit in its place a payment, settled by custom, of rice, clothing, and iron tools.

The most remarkable objects of Salsette are the cave-temples of Kennerly, among the most remarkable Buddhist excavations in India. They are of various sizes and forms, being scattered at different elevations over both sides of a high knoll, belonging to a range of hills which divides the island into two nearly equal parts. The largest, and most remarkable cave, bears a great resemblance to that of Carlee (which see I. 539.), and was converted by the Portuguese into a church. It is entered through a fine and lofty portico in front, a little to the left hand of which is a detached octagonal pillar, surmounted by three lions seated back to back. On either side of the portico is a colossal statue of Budh, nearly 20 ft. in height. The screen which separates the vestibule from the temple has in its centre a large door, above which are three windows in a semicircular arch; elsewhere, it is covered with carved figures. The apartment within is 91*ft.* in length, and 38 in breadth, semicircular, and surrounded on every side, but that of the entrance, with a colonnade of octagonal pillars. Of these, 12 on either side nearest the entrance have carved bases and capitals; the rest are not finished in this manner. In the semicircular end is a dome-shaped rock, the *daggos* of Buddhist temples, traditionally said to have once supported the *tee*, or sacred umbrella. The roof, like that of the Carlee temple, is a semicircular arch, supported by slender ribs of teak-wood. The various other caves in this hill are square, or flat-roofed, and attached to many are deep and well-carved cisterns. There are other cave-temples in the island, at the villages of Mompzeiler, and Ambowlee; and at the former are ruins of a very handsome Portuguese church and Jesuit monastery. (*Forbes & Lord Valentia; Heber, &c., in Mod. Trav.*)

SALTA, a city of S. America, cap. of the prov. of its own name, republic of La Plata, on the high road from Buenos Ayres to Potosi, 820 m.N.W. the former city; lat. 24° 30' N., long. 64° 17' 30" W. Pop. from 8,000 to 9,000. "Upon the whole it has a neat appearance, and boasts of a cathedral and many churches. It is, however, badly situated in the bottom of a valley, through which flow the rivers Arias and Silleta (tributaries of the Salado); the latter of which has, of late years, abandoned its ancient bed, and seems to threaten, at no distant period, to burst over the low marshy grounds upon which the city stands." (*Parish's Buenos Ayres*, p. 273.) Its air is unhealthy; but its vicinity abounds with wheat, rice, cattle, &c., in which, and in salt, wine, hides, and mules, the city has an active trade. It was founded by Don Philip de Lerma in 1582.

SALTASH, a decayed bor., market-town, and par. chapelry of England, co. Cornwall, S. div. hund. of East, 17 m. S.S.E. Launceston, and 4 m. N.W. Plymouth. Pop. of bor., in 1831, 1,637. It stands on a steep rock, near the Tamar, from which the principal street runs at right angles, the houses rising one above another to the hill-top, on which stands the chapel and town-hall. The latter is supported by pillars, the open space beneath being used for a market. Streets narrow and ill-built; the houses being, for the most part, little better than cottages, though chiefly of stone from the rock on which the town stands. The chapel is small; and the living is in curacy subordinate to the vicarage of St. Stephen, value 45*l.* a year. There are also two places of worship for Dissenters, with attached Sunday-schools, and there is a small free-school. Saltash, which appears to have been formerly of more importance than at present, is principally inhabited by fishermen, or persons connected with the docks and shipping of Devonport; and in summer is a favourite resort for holiday-people from Plymouth and the surrounding neighbourhood. It is likewise one of the chief entrances into Cornwall from Devonshire, and is approached by a ferry over the Tamar, the revenues of which belong to the corporation. Saltash was made a free bor. in the reign of Henry III., and returned 2 mems. to the H. of C. from the reign of Edward VI. down to the Reform Act, by which it was disfranchised. It was considered of too little importance to be included in the provisions of the Municipal Reform Act. Markets on Saturday; fairs, Feb. 2, July 25, and the Tuesdays before each quarter-day.

SALT COATS, a sea-port town of Scotland, co. Ayr, partly in the par. of Ardrossan, and partly in that of Stevenston, 24 m. S.W. Glasgow, and about 1 m. S. Ardrossan. Pop. in 1836, about 4,000. It has some good houses; but, on the whole, is indifferently and irregularly built, and mean looking. It has a town-house, with a handsome spire, clock and bell. Its name is derived from the salt-works, established in the town for the production of salt, by the evaporation of sea water; but since the repeal of the duty on salt, they have been nearly abandoned. Magnesia, however, still continues to be produced to some extent. The principal

dependence of the inhab. is on the weaving and sewing of muslins, for the Glasgow manufacturers. There may, in all, be about 500 looms so employed; principally on lapetts, gauzes, shawls, trimmings, silks, &c. About 30,000 tons of coal are annually shipped here for Belfast, Dublin, &c. A good deal of ship-building was formerly carried on; but latterly it has declined. Two congregations belong to the United Associate Synod, and one to the Relief; and there is a Gaelic chapel. It has a subscription library, a parochial school, a free school, managed by a committee of ladies, and other schools, a savings' bank, and some friendly societies, a branch of the Ayrshire Banking Company, &c. The harbour is very defective; and in this respect it labours under great disadvantages as compared with Ardrossan. (*New Statist. Acc. of Scotland, Ayrshire, parishes Ardrossan and Stevenston.*)

**SALUZZO** (*Fr. Saluces*), a city of the Sardinian dom., div. Coni, cap. prov., at the foot of the Alps, on an affluent of the Po, 30 m. S.S.W. Turin. Pop., in 1838, 14,426. It consists of two portions, one on the summit and declivity, and the other at the foot of a hill. The upper town is walled, tolerably well built, and has a castle, which was, for three centuries, the residence of the Marquises of Saluzzo; one of whom, between 1478 and 1490, constructed the gallery through the Col de Viso. (*Murray's Handbook for Piedmont*, 344.) The lower town is the more populous, and continues on the increase. The cathedral, a handsome building, is in a suburb. Saluzzo has several convents, an intendency, a court of primary jurisdiction, and a royal college. It is a bishop's see. Its chief manufactures comprise silk, leather, hats, and hardware: and it has some trade in wine, corn, and cattle. Under the French, Saluzzo was the cap. dep. Stura. (*Rampoldi, Couv.*, &c.)

**SALZBURG**, a city of Upper Austria, cap. of the circ., as it formerly was of an archbishopric of the same name, on the Salzach, a tributary of the Inn, 67 m. S.W. Linz, and 70 m. E.S.E. Munich. Lat. 47° 48' 10" N.; long. 13° 1' 25" E. Pop., in 1834, about 12,000, having decreased considerably since Salzburg ceased to be the cap. of an indep. territory. The Salzach, which here flows impetuously between two masses of rock, divides the city into two portions, connected by a stone bridge, 370 ft. in length. It is walled, and entered by eight gates; and on a lofty point, commanding the town and adjacent country, is the *Hohen Salzburg*, formerly the feudal citadel and residence of the prince-archbishops, but now used as a barrack. On the opposite side of the river is the *Capucinerberg*, a similar height, surmounted by the Capuchin convent. Owing to the number of its churches, the profusion of marble statues, and flat-roofed houses, Salzburg has the aspect of an Italian city. According to Turnbull, one of the principal hotels, which, he says, forms a fair specimen of the general style of building, "is a heavy pile of masonry, five stories in height, and composed of walls, floorings, and internal divisions, from the basement to the roof, entirely of stone." Generally speaking, the city is dull and gloomy, and its streets narrow, irregular, and grass-grown. The cathedral, constructed in the 17th century, on the plan of St. Peter's at Rome, is large and imposing, and has numerous monuments, sculptures, paintings, and other works of art. It has a fine facade of white marble, occupying the whole side of a public square, with three entrances, flanked by two rows of marble statues. Several of the other churches are highly gilt, and decorated. Monasteries are numerous, but the number of their inmates has been much reduced. In the church of the Benedictine convent is the tomb of Michael Haydn, the musical composer, who, as well as Mozart, was a native of Salzburg. The Mirabel palace is a handsome modern edifice. One of the greatest curiosities in the city is a gateway or tunnel, 420 ft. in length, cut through the solid rock (*Spencer*), though for what purpose we are not informed.

Salzburg has a military and three civil hospitals, several charitable institutions, a government pawn-bank, and a prison. It had formerly a university; but this is now reduced to a lyceum of two faculties, medicine and jurisprudence, with a library of 20,000 vols., and probably of 120 MSS., some of the 8th and 9th centuries, a botanic garden, zoological museum, &c. In the Benedictine convent is another extensive library, with collections of coins, &c. It has, also, a gymnasium, Ursuline female school, a spacious public cemetery, a public museum, and a theatre. Salzburg is still the residence of an archbishop, who has five suffragans; and is the seat of the superior courts for the circle, &c. It has manufactures of cotton yarn, leather, starch, gunpowder, iron wire, and files, and some transit trade, though this has very much diminished. It is well and cheaply supplied with provisions; but the prevalence of gold is a drawback to its advantages. All travellers agree that it is hardly possible to exaggerate the romantic beauty of the scenery of the neighbourhood.

Salzburg is supposed to occupy the site of the anc. Ju-

varia, destroyed by Attila in 448. In 803, Charlemagne and the ambassadors of Nicephorus, emperor of the East, met in this town to settle the boundaries of their respective empires. In the 13th century the city became the cap. of a territory, governed by its archbishops till 1802, when it was secularized. (*Est. Nat. Encyclop.; Berghaus; Turnbull's Austria*, i. 139-143.; *Spencer; Germany and the Germans*, ii. 309-312.)

**SAMARANG**, a town and sea-port of Java, on its N. coast, the cap. of a prov., near the mouth of the river of its own name, 240 m. E.S.E. Batavia; lat. 6° 56' S., long. 110° 27' E. Pop. supposed to be at least 20,000, including many Chinese and some Europeans. It is tolerably well built, and is fortified with ramparts and a wet ditch, capable of resisting a native force. It has many Dutch houses, a large church, town-hall, and hospital, a military school, theatre, and observatory. Before it is a deep morass, and it communicates with the sea only by two raised causeways and the river: it is, however, less unhealthy than the lower parts of Batavia. Provisions are cheap; and near the town are many country houses. "The river, or rather creek, is very shallow, and cannot be entered by loaded boats at low water. The roads are also exceedingly insecure: the town owes its importance, therefore, solely to the industry of the natives in the adjoining districts, who raise large quantities of coffee, pepper, and rice. Many ship-loads of the latter are annually exported to China, and to different countries in the Archipelago." (*Earl's Eastern Seas*, p. 49.) Samarang is the seat of one of the three civil and criminal courts, and courts martial in the island, and the residence of a governor with extensive authority.

**SAMARCAUND**, a city of indep. Tartary, in Bokhara, on the Sogd, or Zer-Afshan, 120 m. S.E. Bokhara, lat. 39° 30' N., long. 68° 50' 15" E. Pop., according to Sir A. Burnes, about 10,000. The out-works are said to be about 30 m. in circ., enclosing gardens, parks, fields, and extensive suburbs: the inner wall surrounding the city is of earth, and has four gates. Samarcand has the appearance of having been magnificently built; but it is now in a decayed condition, and gardens, fields, and plantations, occupy the place of its numerous streets and mosques. There were formerly upwards of 200 mosques, many of which were of white marble; but most of these have become mere ruins. Of the 40 *medressas*, or Mohammedan colleges, only three are perfect, one of them forming the observatory of the celebrated Ulug Beg being extremely handsome, ornamented with bronze and enamelled bricks. Another college, called Sherdar, is likewise of very beautiful architecture. The tomb of the famous Timour Bec, or Tamerlane, and his family, still remains; and the ashes of the emperor rest beneath a lofty dome, the walls of which are superbly adorned with jasper and agate.

Samarcand has several bazars, and three large khans; but its commercial importance is all but extinguished; Bokhara having been for many years the great entrepôt of the caravan-traders, as well as the modern capital of the country. The ancient city, however, is still regarded with high veneration by the people, and till a king of Bokhara has annexed Samarcand to his rule, he is not viewed as a legitimate sovereign; indeed, its possession becomes the first object on the demise of one ruler and the accession of another. Paper, made of silk, is said to have been early manufactured at Samarcand; but ordinary paper is now supplied from Russia. The situation of the city has been deservedly praised by Asiatics, since it stands near low hills, in a country elsewhere plain and level. The climate is dry and healthy; good water is supplied from a great number of fountains, communicating by pipes with the river, and the neighbourhood furnishes abundance of fruit, and other supplies for the market.

Samarcand, which was taken in 1220 by Jenghis-khan from the sultan Mahomet, became under Timour the capital of one of the largest empires in the world, and the centre of Asiatic learning and civilization, at the same time that it rose to high distinction on account of its extensive commerce with all parts of Asia. It was reunited to Bokhara by Abdullah at the close of the 16th century, since which it has gradually fallen to its present rank as a mere provincial town; and we may now search in vain for its ancient palaces, the beauty of which is eulogised by the Arab historians. (*Burne's Bokhara*, ii. 270-272.; *Diogenes*, *l'Asie Occidentale*; *Ritter's Asien*, vol. v.; *Diet. Grog.*)

**SAMBOR**, a town of Austrian Poland, cap. circ. of same name, on the Dniestr, 44 m. S.W. Lemberg. Pop. nearly 10,000. (*Berghaus*.) It is tolerably well built, and has several R. Catholic and United Greek churches, an hospital, a criminal tribunal, mining court, salt intendency, gymnasium, &c. Its inhabs. are employed partly in the manufacture and bleaching of linens, and partly in making salt. Rhubarb is cultivated in the neighbourhood. (*Occurr. Nat. Encyc.*)

**SAMOS**, a famous island of the Ægean Sea, now belonging to Turkey, off the W. coast of Asia Minor, from which it is separated by the narrow strait called the

Little Boghaz, only 2 m. across. It has on the N. the Gulph of Scala Nova, is about 30 m. in length, E. and W., by about 8 or 9 in mean breadth; Mount Kerkli, on its W. extremity (an. *Catabates*, from its collecting clouds and generating thunder), being in lat.  $37^{\circ} 43' 48''$  N., long.  $26^{\circ} 38' 21''$  E. The pop. was estimated by Tournefort at 12,000; Mr. Turner, a later, though inferior authority, estimates it at 60,000; but this, we have little doubt, was decidedly beyond the mark, even at the time when it was framed; and since the revolution in Greece, there has been a good deal of emigration from the island. A chain of mountains runs from one extremity of the island to the other: most of them are covered, as in antiquity, with forests of oaks and other timber, though in parts they are precipitous and bare. Tournefort says that they consist principally of white marble. It has several pretty extensive valleys, especially on its S. shore, which, being well watered by streams from the hills, produce, even with the most deficient culture, excellent crops of wheat and other grain, with olives, figs, oranges, and other fruits, wine, silk, cotton, &c. In antiquity it was celebrated for its extraordinary fertility; it was then, also, cultivated with the utmost care, and the walls still exist which were built to form the sides of the mountains into terraces, and to facilitate their culture. (*Tournefort*, l. 407.) It still continues to be the most productive island of the Archipelago. It annually exports considerable quantities of corn; from 25,000 to 30,000 cantars grapes, and about 15,000 barrels raisins. The only thing which Strabo did not admire in Samos was its wine (lib. xiv.); but Tournefort says that when properly made, its muscadel wine is very superior. Perhaps it was not produced in antiquity. Oil and valonia are also considerable articles of export. Wolves and other wild animals occasionally commit ravages among the oxen and sheep; poultry are excellent, and partridges exceedingly abundant. Exclusive of marble, it is said to furnish iron, lead, and even the precious metals.

Having voluntarily surrendered to the Turks, this island has been less harshly treated by them than most others in the Archipelago. It is, however, zealously espoused the cause of the other Greeks during the revolutionary struggle; and, though it was assigned to the sultan by the treaty which recognised the independence of Greece, the inhab. refused at first to submit to his officers. Previously to this event, the government of the island was substantially vested in three primates, chosen by the inhabs. But this, if we may believe Mr. Turner, by whom the higher order of Samians are called "the most unprincipled miscreants in existence" (iii. 110.), would seem to have been no great boon. Besides being oppressed by the agents of the Sultan and the Primates, the island has, also, been fleeced by a swarm of Caloyers, Papas, and other Greek priests, whose only claim to live at the public expense is, that they are able to repeat mass from memory. A considerable sum is remitted to the bishop of Nicaria for his important services in blessing, once a year, the water and cattle of the inhabitants! (*Tournefort*, l. 408.)

The present cap. of the island, called Khora, or Megall-khara, is on its S. side, about 2 m. from the sea, on the lower extremities of a mountain, on the ascent of which the citadel of the ancient city was situated. Though not without some good houses, it is a miserable town, having stony, steep, unpaved, and hardly passable streets. Vathi, on the N. side of the island, is larger than Khora, and has an excellent harbour; but it, also, is a wretched place, with streets from 6 to 8 ft. in width, execrably paved and steep. (*Turner*, iii. 107.)

Such is the present state of an island that, in antiquity, was one of the most famous in the Ægean Sea. Samos attained to great distinction. She was one of the most powerful of the states belonging to the Ionian confederacy; and was able by means of her fleets, to maintain her independence after Croesus and Cyrus had reduced the states of Ionia, on the Continent. The city of Samos, on the S. shore of the island, was extensive, and populous, strongly fortified, and adorned with many noble public buildings. Among the other great works executed by the Samians, Herodotus specifies a tunnel, which they had carried through a mountain, to convey a supply of water to the city; an immense mole, constructed for the security of the harbour (of which the remains still exist), about 120 ft. in height, and which advanced in a curved line about  $\frac{1}{2}$  m. into the sea; and the largest temple of which he (Herodotus) had any knowledge. (*Herod.*, lib. iii. cap. 60.)

The temple to which the venerable historian alludes was dedicated to Juno, and stood a little to the W. of the city near the Imbrasus. The island, indeed, was especially sacred to Juno, and was supposed to have been the place of her birth, and where she espoused Jupiter. Hence, says Virgil, speaking of Carthage, where the Goddess had also a temple—

Quam Juno fertur terris magis omnibus unam  
Foschitate coluisse Sano. — *Æneid* I. lin. 19.

The statue of the goddess in this temple was very ancient, having been the work of Smilis, a contemporary of Dædalus. Among other statues in and near the temple, were those of Jupiter, Minerva, and Hercules, by Myron, one of the most celebrated sculptors of antiquity. Mark Antony carried off these statues to Rome; but Augustus made those of Minerva and Hercules be returned to Samos, retaining only that of Jupiter.

The Hærean games, instituted in honour of Juno, called by the Greeks *Hæa*, were celebrated here with extraordinary splendour. Like other great temples, that of Juno was an asylum for all who implored the protection of the goddess; and Tacitus notices the arrival of deputies from Samos, at Rome, praying that the *statutus Asyli* might be confirmed. (*Annal.* iv. cap. 14.) The subsequent history of this famous edifice is but little known. It has, however, fallen a sacrifice to the ravages of time, or of barbarians, or both. When visited by Tournefort, more than a century ago, portions of two columns were all that remained standing.

Among other things Samos was famous in antiquity for its pottery, which was everywhere in great request; and the art of manufacturing it is even said to have been discovered in this island.

The government of Samos experienced the mutations common to the governments of most Greek states. Originally it was kings, who were superseded by a mixed government, inclining sometimes to democracy, and sometimes to oligarchy; while occasionally it was subject to tyrants. Of the latter, the most celebrated is Polycrates, who attained to the sovereignty in the 6th century B.C. His object seems to have been to retain the government partly by force, partly by corrupting and reducing the inhabs., and partly by engaging them in schemes of foreign conquest. (*Miford's Greece*, l. 450.) At a period subsequent to the death of Polycrates, who was invigilant and crucified by the satrap of a neighbouring province, the Samians were attacked by the Athenians, under Pericles; who, after an obstinate struggle of 9 months' duration, succeeded in reducing their city; and at a somewhat later period it received a colony from Athens. During the contest between Mark Antony and Augustus, Samos was, for a while, the head quarters of the former and of Cleopatra, who kept court here with more than regal magnificence. After Augustus had become the master of the Roman world, he passed a winter in this island, which he restored to its freedom, and at the same time conferred on it other marks of his favour. It afterwards became subject to the Greek emperors; and finally, in the 16th century, to the Turks, under whose brutalising sway it has been reduced to the miserable state in which we now find it.

Of the many illustrious individuals that Samos has produced, Pythagoras is by far the most distinguished. The era of his birth is not quite ascertained, but it is supposed to have occurred about 580 years B.C. He early visited Egypt and other ancient seats of learning; but, on his return from his travels, being, as is said, dissatisfied with Polycrates, he emigrated to Magna Græcia, and founded at Crotona a school of philosophy, that speedily attained to the highest celebrity. Samos also gave birth to Rhæcus, said by Herodotus to have been the architect of the temple of Juno, to Theodoros the sculptor, and a host of others. Anacreon was among the distinguished guests invited by Polycrates to Samos.

The narrow strait between Samos and the mainland is famous in ancient history for the great victory gained in it and the adjacent promontory of Mycale, over the fleet and army of Xerxes, on the same day that the forces he had left in Greece, under Mardonius, were destroyed at Plataea. (Exclusive of the authors already referred to, see *Ancient Universal History*, viii. 259—284., and xiii. 510. See also: *Anacharsis*, cap. 74.; *Facciolati Lexicon*, vocæ Samos, &c.)

SANA, a city of Arabia, the cap. of Yemen, and the residence of the Imâm, in a valley from 6 to 9 m. in breadth, and 4,000 ft. above the level of the ocean, near the head of the Shab river, and about 150 m. N.N.E. Mocha. Pop., according to the estimate of Mr. Crutenden, in 1836, 40,000. The city is walled; as is also its suburb of Bir-el-Azab, which was open in Niebnhr's time. The city and suburb, together, are said to be  $\frac{1}{2}$  m. in circ. The walls are mounted with cannon, but these are in a very bad condition. At both the E. and W. extremities of the city is a castle, having each a palace of the Imâm. The streets of Sana are narrow, though broader than those of Mocha, and some other Arabian cities. A handsome stone bridge is thrown across the principal street, down which a stream of water runs in wet weather. Houses principally built of brick, with open holes for windows, closed when necessary by wooden shutters; but some, belonging to the higher classes, have glass windows, beautifully stained. The palaces are built of hewn stone, plastered over with grey-coloured mortar. All the private resi-

dences in Sana appear to be furnished with fountains. There are about 20 mosques, very elaborately adorned, many having their domes gilt, especially those in which are the tombs of the Imams. The public baths are both numerous and good: they are on the same plan as those of Egypt, and "a favourite resort of the merchants, who meet here to discuss the state of trade, and the news of the day over their cup of keshr, and their never-failing hookah."

A part of the city is appropriated to the Jews, who amount to about 3,000. Each pays about a dollar a year for permission to reside; and a sheikh is appointed, who is responsible for the regular payment of this impost, and of the heavy taxes laid upon their vineyards, gardens, &c. The Jews subsist chiefly by the sale of silver ornaments, gunpowder, and spirituous liquors, and many by working as common artisans, such as shoemakers, &c. There are also many Hindoos among the population, who, like the Jews, are obliged to conceal as much as possible the property they possess, for fear of exaction. The Mohammedan merchants are generally wealthy, and live in good style. The principal trade of Sana is in coffee, the city being in the heart of the coffee country of Yemen. The article is brought into the market in Dec. and Jan.; and considerable quantities of it are retained in the warehouses. It is, however, little used for home consumption, the favourite beverage being *keshr*, an infusion of the husk. The coffee-husk accordingly fetches here the higher price of the two, from 4 to 12 dollars per 100 lbs. being paid for it. Very fine silk goods, spices, sugar, &c., are exposed for sale in the bazars. The imports are principally piece goods and Persian tobacco; with dates, and a great quantity of thread, or rather twist for weaving. Glass is in great request, and is principally supplied from Egypt. The import duties at Sana are so slight as to be almost nominal.

The climate is too dry to be healthy; rain seldom falls, and famine appears to be a frequent result. Some inscriptions, supposed to be in the ancient Himyar character, have been discovered here (see *Grog. Journal*, vii. 287.), but travellers have hitherto found few, or no other antiquities. The greater part of the fortifications, and an aqueduct now ruined are said to have been the work of the Turks, who held the sovereignty of the country till about two centuries ago. (*Crutenden, in Grog. Journal*, viii.; *Niebuhr, Voyage en Arabie*, &c.)

**SANDWICH**, a cinque-port, muo. and parl. bor. of England, co. Kent, lathe St. Augustine, hund. Eastry, on the Stour, about 2 m. from its mouth, and 65 m. E. by S. London. Area of town and port, 1,960 acres. Pop., in 1831, 3,136. The parl. bor. however comprises, with the foregoing, the pars. of Deal and Walmer, and the extra-parochial hamlet of St. Bartholomew, having an aggregate area of 3,810 acres, and a pop., in 1831, of 12,235. Sandwich is divided into the three pars. of St. Mary, St. Peter, and St. Clements. It is washed on the N.E. by the river Stour, and surrounded on every other side by a dyke, the remains of its old fortification. It is irregularly built, and has a more ancient appearance than, perhaps, any other town in the county. The streets are well paved, and lighted, and the inhabs. are supplied with excellent water from the river, and from a spring which rises near the Eastry, and is brought to the town by a canal, 3 m. in length. St. Clement's church is a spacious building, with a massive tower of Norman architecture rising from four semi-circular arches in the centre of the building, and supported on strong piers. In some parts it is curiously ornamented. The living is a vicarage, with a nett income of 310*l.* a year. St. Mary's is also a vicarage, worth 117*l.* a year nett. Both the foregoing pars. are in the gift of the archdeacon of Canterbury. St. Peter's is a rectory, in the gift of the crown and the corporation of Sandwich alternately, worth 144*l.* a year nett. There are places of worship for Independents and Wesleyans; two hospitals, one founded in the 12th century, and accommodating 16 residents, who must be free-men; and the guildhall, built in 1579, and a new house of correction, comprise most of the remaining public buildings. The free grammar school of Sandwich was founded in the reign of Elizabeth, and received considerable endowments in lands in 1563. Its governors are the mayor and corporation; it has four scholarships in Lincoln College, Oxford, of which two are in the appointment of the governors of the school, and two in that of the rector and fellows of the college; and four in Calus College, Cambridge, nominated in a similar manner. It has, also, a national school and other charities. The town has been for several years in a depressed and declining state. It has no manufactures, and its trade is trifling, consisting principally in the importation of coal for the use of the town and neighbouring country. The scheme of straightening the course of the Stour to the sea so as to form a canal, has been abandoned for want of capital and enterprise. (*Munic. Bound. Rep.*)

Sandwich was first incorporated by Edward III. Its corporation consists of 4 aldermen and 12 councillors,

styled the mayor, jurats, and commonalty of the town and port. Their jurisdiction extends over Ramsgate, Sarr, and Walmer, and did formerly over Deal, which are all members of this cinque-port. Sandwich has, however, no commission of the peace except upon petition or grant. It has sent two mems., usually styled barons, to the H. of C. since the 42d of Edw. III. Previously to the Reform Act, the right of voting was in the freemen, resident and non-resident, the freedom being acquired by birth, gift, marriage, apprenticeship, ownership, and residence. Registered electors in the new parl. bor., in 1839-40, 977; corp. revenue, in 1839, 1,339*l.*

Sandwich, formerly called Lundenwick, appears to have risen into consequence, on the decline of Richborough, the an. *Athutapum*, about the 6th century. It was long a place of considerable trade, and continued, till a comparatively late period, to be a kind of out-port to London, many goods being conveyed by land to and from the capital. Markets, Wednesday and Saturday, fair, Dec. 4, for clothing, &c. (*Man. and Bound. Reports*, &c.)

**SANDWICH ISLANDS.** (See **POLYNÆIA**.)

**SANQUHAR**, a royal and parl. bor. of Scotland, co. Dumfries, in the valley of the Nith, and near the left bank of that river on the road from Dumfries to Ayr, 26 m. N.W. the former. Pop., in 1831, 1,527. It consists principally of a main street along the line of the high road. It has a town-hall, with a tower and clock, a handsome par. church, built in 1823, 2 chapels in connection with the Associated Secession Church, and a chapel for Anabaptists, with a parochial and other schools, a subscription library, a savings' bank, &c. The inhabs. are principally dependent on the weaving of cottons, and on the sewing and embroidery of muslins for the Glasgow manufacturers. There is an extensive carpet manufacture at Crawick Mill, about 1 m. from the town.

Sanquhar seems to have derived its origin from its fine old castle, now in ruins. This, which formerly belonged to the lords of Sanquhar, having been purchased in 1630 by an ancestor of the last duke of Queensberry, became, on the demise of the latter, with other vast possessions in Dumfriesshire, the property of the family of Buccleugh. It was created a royal bor. in 1596, and is united with Dumfries, Annan, Lochmaben, and Kildunbright in sending 1 mem. to the H. of C. Registered electors, in 1839-40, 66. Corporation revenue, in 1839-40, 73*l.* Councillors, 17. (*New Statistical Account of Scotland*, art. *Sanquhar*; and *Official Returns*.)

**SANTA CRUZ.** (See **TENERIFE**.)

**SANTANDER** (an. *Portus Blandium*), a city and seaport on the N. coast of Spain, cap. prov. of its own name on the W. side of the bay of the same name, running into the Bay of Biscay, 50 m. W.N.W. Bilbao. Pop., acc. to Miñano, 18,716. It is built on the slope of a hill, and has wide streets lined with tolerably respectable houses, the principal public edifices being the cathedral, 2 par. churches, and 3 hospitals. Few of these, however, possess any architectural merit; and Captain Cook, an intelligent traveller, states, that "Santander is almost the only place in Spain of similar magnitude, where no artist in any department has left a memorial of his skill." (*Sketches in Spain*, i. 76.) It is a thriving town, however, with a considerable number of new houses, very unusual in Spain; and it is the chief seaport of Old Castile, it having been the principal object of the government for some years back to make it one of the principal marts for the supply of Madrid. It has a large trade with Cuba, to which it sends the wheat of Castile, large mills being erected in the neighbourhood for converting it into flour previous to embarkation. The exportation of wool is at present shared with Bilbao; but when the roads are completed, it will have the superiority over that port from its greater proximity to the wool-bearing districts. There are iron-mines in the neighbouring mountains; but, owing to the disturbed state of the country for some years past, they have been little wrought. The *astillero*, or building establishment of the marine, formerly much employed, is now almost in ruins; and the forests of the Montana, which once supplied Spain with nearly all the timber for the navy, are now seldom used, except for the supply of fuel. The harbour of Santander is large, well sheltered, easily accessible, and sufficiently deep for all trading vessels. The vicinity produces an abundance of wheat and other grains, fruits of several varieties, and large quantities of cattle; the coast also swarming with salmon and other kinds of fish. (*Cook's Sketches*, i. 75-78.; *Miñano*, &c.)

**SANTAREM** (an. *Præsidium Juliani*) a river-port and town of Portugal, formerly the residence of the court, prov. Estremadura, cap. comarca, on the Tagus, 45 m. N.N.E. Lisbon. Pop. estimated at 8,000. It is built on a hill, and consists of 3 separate parts; the Maravilla, on the summit, the Ribera on the E. declivity, and the Alfange on the W. and S., descending to the river's bank, and commanded by the fortress of Alcaçaba. Only

a few portions of its old walls remain. It is well built, and has some good public edifices; but these are much neglected, and several have almost fallen to ruin since the removal of the court to Lisbon. In the 15th century. Besides numerous churches and convents, Santarem has several hospitals and asylums, and two Latin schools; and it is the seat of the Patriarchal seminary, the highest ecclesiastical establishment in the kingdom. Its environs are fertile, and well cultivated, and it has an active trade with Lisbon. (*Dict. Géog., &c.*)

SANTORINI (an. *Thera*), an island of the Ægean Sea, belonging to the S. Cyclades, 65 m. N.N.E. from the nearest point of Crete, Mount St. Elias, the highest point of the island, being in lat.  $36^{\circ} 20' 45''$  N., long.  $25^{\circ} 28' 30''$  E. Pop. 12,000. This island is shaped like a crescent, or rather horse shoe, the concave side to the W., forming a bay, sheltered by the Islands Therasia, Aspronisi, &c. The island has a dismal appearance from the sea, consisting wholly of black volcanic rocks, without wood, rivers, or rivulets; but it has, notwithstanding, some very fertile districts, the decomposed volcanic rocks and ashes supplying a fruitful soil, which being carefully cultivated, produces corn, cotton, and large supplies of wine. The inhab. have no water, other than that which they collect in cisterns; and the calcined rock, being of a light consistency, the houses are rather excavated in it than built. Pyrgos in the centre of the island, near the seat of the ancient Thera and 151. Scarcely on the coast of the bay, are the only towns of any consequence. The inhab. are very industrious; and have sustained little other inconvenience from the Turkish domination except that of paying the tribute due to the Porte.

It was the general opinion of the ancients, that this island, and others in its vicinity, had been thrown up from the bottom of the sea; and Pliny says that this event occurred in the 4th year of the 135th Olympiad. (*Hist. Nat. lib. ii. cap. 87.*) No doubt, however, this date is erroneous; as it appears from Herodotus, that the island was inhabited 1,550 years B.C., or 1313 years before the epoch assigned by Pliny for its appearance. (*Herodot. lib. iv. c. 174.*) Thera and 151. Scarcely, unless the date given by Pliny be vitiated, he may have referred to some eruption that had occasioned an enlargement of the island. The convulsions of which it was anciently the theatre, have not been suspended in more modern times; a new island having been thrown up near its coast in 1573, and another in 1707, each being preceded by a violent volcanic eruption. In remote antiquity it was called *Calliste*, or the beautiful, an epithet that never could have been applied to it, had its appearance then been at all like that which it now exhibits. The ruins of its ancient city, Thera, on the hill now called St. Elias, evince its extent and magnificence. (*Tournefort, l. 261., &c.; Sonnius's Greece and Turkey, 287., &c. Eng. trans.; Herodot. par Larcher; Tab. Géog. art. Thera, &c.*)

SANTOS, a town and sea-port of Brazil, prov. St. Paul, in a low and unhealthy situation on the N. side of the island St. Vincent, 35 m. S.S.E. St. Iaul, lat.  $23^{\circ} 56' 15''$  S., long.  $46^{\circ} 0' 15''$  W. " Santos is a place of considerable trade, being the storehouse of the great captaincy of S. Paulo, and the resort of many vessels trading to the Rio de la Plata. It is tolerably well built; and its pop., consisting chiefly of merchants, shopkeepers, and artificers, amounts to 6,000 or 7,000." (*Mawe, p. 63.*) The pop. has, however, increased materially since the publication of Mawe's work. Several rivulets flowing from the mountains unite in one great river a little above the town. The port is formed by the continent and the island St. Amaro. There are two entrances, but that of the S. is alone navigable by large vessels; the other, which is formed by the river Bertoga, being fit only for small craft. The harbour admits ships of large burden, which are sheltered from all winds except those from the S. S.W. round to the S. E. A pilot is not absolutely necessary on entering. " In advancing into the river Santos, you will have 10, 9, 8, and 7 fathoms water, until you near the bar, upon which there are only from 4½ to 5 fathoms; the entrance is narrow, but the starboard side is much the boldest, and has 19 fathoms water close to the shore. After passing the first *barro grande*, the water deepens to 15 and 16 fathoms within 12 fathoms of the shore. The best anchorage will be abreast nearly of the centre of the town, in 7 fathoms, on a bottom of mud. Provisions are abundant, and good water may be obtained by sending a boat about 7 m. farther up the river." (*Lilant's Sailing Directions.*) The port called the Narrows is defended by 2 forts.

Though the commerce of Santos will not bear to be compared with that of Rio or Bahia, it is very considerable. Sugar is the great article of export; and the shipments of it have latterly been increasing. The imports are similar to those of Rio, which see. Being, as it were, the port of St. Paul's, an extensive intercourse is carried on with the latter. We subjoin

AN ACCOUNT of the Exports of Sugar from Santos during the three Seasons ending with 1839-40.

Shipped for	1839-1840.	1838-1839.	1837-1838.	1836-1837.

SAONE (HAUTE), adép. of France, reg. E.; between lat.  $47^{\circ} 18'$  and  $48^{\circ}$  N., and long.  $5^{\circ} 35'$  and  $7^{\circ}$  E., having N. the dep. Vosges, E. Haut-Rhin, S. Doubs, and W. Côte-d'Or and Haute-Marne. Length N.E. and S.W. about 70 m., breadth varying from 25 to 40 m. Area, 530,990 hectares. Pop., in 1836, 338,910. In the N. and E. are the Vosges mountains, and their ramifications. The general slope is to the S.W., in which direction the Saône traverses the dép. throughout its centre. The Oignon forms its S.E. boundary. There is a considerable extent of rich soil. In 1834, the arable lands were supposed to comprise 256,103 hectares, meadows 58,923 do., vineyards 11,769 do., and woods 184,230 do. Agriculture has made some progress within the present century; but it is still very backward. The produce of corn, pulse, &c., exceeds the demand for home consumption. Wheat, oats, and barley, are the principal crops. In 1835, according to the official returns, nearly 1,820,000 hectol. of grain of all kinds were harvested, besides about 1,000,000 do. potatoes. The vineyards form a principal source of wealth. The produce may be estimated at about 350,000 hectol. a year. The wines of Ilay, Charley, Navenne, Quincy, Gy, and Champplitte-le-Chateau, are the best: they have a fine colour, body, *un bon goût*, and may be kept for a long time. *On peut les considérer comme de bons vins d'ordinares de troisième qualité.* (Jullien, p. 135.)

Near the Vosges, large quantities of cherries are grown for the manufacture of *kirschwasser*. Timber is an important product; and the annual produce of wool is estimated at 130,000 kilogr. In 1835, of 129,312 properties subject to the *contrib. foncière*, 7,324 were assessed at less than 5 fr., and 20,455 at from 5 to 10 fr.; while only 91 were assessed at 1,000 fr. and upwards. In minerals, this dép. is one of the richest in France. In iron, it has 41 iron forges employ about 5,000 hands; and bar iron, iron plates, and wire, steel, and various iron goods are made to the annual value of 14,000,000 fr. Glass and earthenware, cotton goods, paper, and hats, are also produced: the exports are, however, mostly confined to agricultural products, and iron goods. Haute-Saône is subdivided into three arronds.: chief towns, Vesoul, the cap., Gray and Lure. It sends four members to the Ch. of Dep. Registered electors, in 1838-39, 1,052. Total public revenue (1831) 7,861,653 fr. According to Hugo, " Les habitants de la Haute Saône ayant été moins mêlés avec les conquérants français ou bourgeois que ceux d'autres parties de la France, représentent assez exactement, par leur extérieur, l'ancienne race Gauloise ou le peuple Gallo-romain." (Hugo, art. Haute Saône; French Official Tables.)

SAONE-ET-LOIRE, a dép. of France, reg. E. principally between the 46th and 47th degs. of N. lat., and long.  $3^{\circ} 40'$  and  $5^{\circ} 30'$  E., having N. Côte d'Or, E. Jura and Ain, S. Rhône and Loire, and W. Allier and Nievre. Area, 856,472 hectares. Pop., in 1836, 524,180. The E. and W. parts of the dép. are level; the centre is mountainous, the mountains dividing the basins of the Loire and the Saône. These two rivers are, however, united in this dép. by the canal du Centre. Nearly half the surface consists of a rich and fertile soil. In 1834, the arable lands were supposed to comprise 456,323 hectares, meadows 126,655 do., vineyards 37,536 do., and woods 150,694 do. The produce of corn exceeds what is required for the consumption of the dép.: in 1835, 2,588,000 hectolitres, principally wheat and rye, are said to have been harvested, besides 2,250,000 hectolitres potatoes; which last form the staple food of the inhabs. of the mountains. Some of the vineyards in this dép., especially those in the arrond. of Chalon-sur-Saône, produce wine that ranks in the first class of Burgundy. The wines produced in the other districts are known in commerce by the name of *vins de Mâcon*. They are excellent as *vins ordinaires*, but cannot be compared with the first-rate growths. Jullien says that their proper place is in the second class of burgundies, immediately after the finest growths of Beaune; and that they are *en général corsés, spiritueux, quelquefois trop fumeux, et toujours agréables.* (p. 121.) The produce of wine is estimated at about 500,000 hectol. The arrond. Charolles has some fine pastures: and, in 1830, the dép. was supposed to possess 250,000 head of cattle, and 405,000 sheep, being a much larger stock than in any of the neighbouring dép. A great number of hogs are reared. In 1835, of 129,312 properties subject to the *contrib. foncière*, 70,987 were

planted by the Wolga with the Nijni-Novgorod and the Caspian Sea, and by the Medveditz and Don, with the Sea of Azof. The Tartars have a large trade in sheepskins, and the Kalmucks in horses of a very fleet, though weak breed. About 5,000 merchants, trading in corn, salt, fish, caviar, cattle, tobacco, and fruits, had a few years since an aggregate capital of 11,175,000 roubles. Saratof is divided into 10 districts; chief towns Saratof, Volsk, and Tzaritsyne. The population are mostly divided among the Greek, Protestant, and Mohammedan religions. Education, except in the schools of the colonists, and of the capital town, is at a very low ebb; and in 1830 there was but one printing-press in the government.

SARATOF, a town of Russia in Europe, cap. of the above gov., on the Wolga, 335 m. S.E. E. Nijni-Novgorod, and 360 m. N.N.W. Astrakhan. Lat. 51° 31' 34" N. long. 46° E. The pop. (including military), according to the official accounts, exceeds 35,000; but this is believed to be beyond the mark. It consists of an upper and lower town; but, though founded so late as 1655, it is neither regularly laid out nor well built. It has some good and even handsome stone residences; but most of its houses are of wood, and it has frequently been in great part destroyed by fire. There are about a dozen Greek-Russian churches, some convents, a Protestant and a R. Catholic church, a mosque, and a *gostinnoi-duor*, or bazaar, a large stone building for the warehousing, exhibition, and sale of merchandise. Since 1833, a new and handsome archbishop's palace has been constructed; and there are several hospitals, a gymnasium, and an ecclesiastical seminary, established in 1828, and having at present (1841) about 500 students. The inhabs. manufacture cotton fabrics, cotton and silk stockings, cloaks and watches, leather, wax lights, tallow, vinegar, beer, &c. Saratof, which is intermediate between Astrakhan, on one hand, and Moscow and Nijni-Novgorod on others, has an extensive trade, its exports being principally corn, salt fish, hides, cattle, and native manufactured goods; and its imports, tea, coffee, sugar, iron, glass, and earthenware, woollen, silk, and cotton stiffs, peltry, &c. It has three large annual fairs. (*Schneitzler, La Russie; Pissart, Das Kaiserth. Russland*, p. 591—616.)

SARATOGA SPRING, the great watering place of the U. States, in the state of New York, co. Saratoga, 28 m. N.N.W. Albany. Resident pop. in 1830, 2,204. This incorporated village consists of a fine broad street fringed with trees, and has many large and excellent hotels, a Presbyterian church, post-office, and numerous boarding houses. The springs, which came into repute through the Indians in 1767, are spread over a tract 12 m. across. Congress-spring, the most celebrated, was discovered in 1792. A gallon of its water holds in solution 385 grains of sea-salt; 3.5 do. hydriodate of soda; 8.982 do. bi-carbonate soda; 95.788 do. bi-carbonate magnesla; 98 do. carbonate lime; 5 do. carbonate iron; and 1.5 do. silice. Above 1,500 people have been known to arrive here in a week, coming from all parts of the states, even from New Orleans, a distance of between 2,000 and 3,000 m., during the unhealthy season in the S. States. A very profitable trade is carried on by the proprietors of the several springs in the water, which is bottled and sent to distant parts. The spring water loses its pungency, however, and its iron is entirely deposited, by being too long kept in bottles.

The vicinity of Saratoga is especially interesting, from its being the scene of one of the leading events in the war of independence, the surrender of General Burgoyne, and the British troops under his command, to General Gates, 17th Oct. 1777. (*New York Gaz.; Stuart's America*, i. 189, 190.)

SARDINIA (Ital. *Sardegna*, Fr. *Sardaigne*, an. *Ich-nusa*, from its resemblance to the print of a foot, *post Sardinia*), an island, in S. Europe, and next to Sicily, which it nearly equals in size, the largest in the Mediterranean. It lies principally between the 39th and 41st degs. of N. lat., and the 8th and 10th of E. long., being separated from Corsica on the N. by the Strait of Bonifacio. It is of an oblong form; length, N. and S., about 160 m.; average breadth, about 60 m.; area, with its dependent islands, 9,240 sq. m. Pop., in 1838, 524,633. Sardinia differs from Corsica in being more diversified, more fertile, and richer in minerals. A large proportion of the surface is hilly or mountainous. The principal mountain chains extend from N. to S. at no great distance from the E. coast; but in various parts of the island there are ranges of considerable length stretching in an opposite direction. The general elevation of the mountains is from 1,000 to 3,000 ft.; the peak of Limbarra, however, is 3,686 ft., and that of Genargentia, in the chain of that name (the *Inasani Montes* of antiquity), 5,276 ft. in height, an altitude which enables the people of Arizzu to trade in snow for the consumption of the capital. (*Smyth*, p. 67.)

There are many extensive plains, the principal being those of Ozieri and Sassari in the N., that watered by the Tiral in the centre, and the *Campidano*, between

Oriстано and Cagliari, in the S. The Tiral, Flumendoso, Cogulinas, Mannu, &c., flowing through these plains, are considerable rivers; the minor *campi* are watered by numerous small streams. Around the coasts are many lagoons, and several considerable bays, as those of Cagliari, Oriстано, Sassari, Orisoi, &c.

The mountain-chains of Sardinia and Corsica have a similar formation, being composed of granite, schist, primitive limestone, &c. Through the centre of Sardinia, from N. to S., extends a remarkable tertiary formation of a calcareous nature; and various volcanic products are scattered over this formation, while the traces of extinct craters are visible in many parts of the island. Earthquakes, however, are rare; nor are storms frequent, though the climate is proverbially variable as to temperature. According to Capt. Smyth the mean temperature of the year, at the level of the sea, may be taken at 61.7° Fah., and the medium height of the barometer at 29.69.

Extensive districts are very unhealthy, and in antiquity the island was celebrated alike for the excellence of its soil and the badness of its air. *Sardinia fertilis, et soli quam ceteri melioris; atque ut fecunda, ita pene pestilens.* (Pomp. Mela, lib. ii. cap. 7.) "The *intemperie*, as the malaria is here called, appears to be somewhat different from the malaria of Italy and Sicily; for though equally, or even more acrimonious in effect, it does not always produce the swelled bodies and sallow skins which are the symptoms of the latter. Both diseases usually commence when the summer heat, assisted by light showers, disengages the impure gases from the low grounds, and continue until the latter end of November, when heavy rains have precipitated the miasma, and purified the air. But they differ, inasmuch as malaria is generally supposed to be weak in its effects unless imbibed during sleep; whereas intemperie, though worst at night, is pernicious at all times." (*Smyth's Sicily*, p. 82.) The chief source of insalubrity appears to consist in the exhalations from the numerous marshes and stagnant pools of the plains, and might, therefore, it may be fairly concluded, be greatly abated by a proper system of drainage. Fire is said to be a powerful antidote against the evil; and the lords of Oriстано were formerly accustomed to light large fires round the town, which had the effect either of rarefying or destroying the mephitic vapours.

Notwithstanding her extent, the richness of her soil, her position in the centre of the Mediterranean, and her convenient harbours, Sardinia has been strangely neglected, not only by her own governments, but by the European powers generally; and has remained, down to our own times, in a semi-barbarous state. A long series of wars and revolutions, followed by the establishment of the feudal system in its most vexatious and oppressive form; the fact of her having been for a lengthened period a dependency of Spain, and, if that were possible, worse governed even than the dominant country; the division of the island into immense estates, most of which were acquired by Spanish grandees; the want of leases, and the restrictions on industry, have paralysed the industry of the inhabs., and sunk them to the lowest point in the scale of civilisation. Since 1750, however, improvements of various kinds have been slowly, but gradually gaining ground; and, within the last few years, several important and substantial reforms have been introduced, that will, it is to be hoped, conspire to raise this fine island from the abyss into which it has been cast by bad laws and bad government.

Besides that portion of the island occupied by lakes and marshes, there are large sandy or stony districts, called *macchie*, which comprise, in the aggregate, more than 1-3d part of the island; a similar extent may be assigned to forests and pastures; the remaining portion of the surface being laid out in corn-fields, vineyards, olive-grounds, orchards, gardens, &c. About 1-5th part of the cultivated land is supposed to be allotted to the growth of corn, which, even under the present system of agriculture, is said to give a return of 7 or 8 for 1; and, in some favoured districts, the average is said by Smyth to amount from 16 to 50 for 1. Of the capacity of the island for producing the most luxuriant crops of corn, there can, indeed, be no manner of doubt. In antiquity, Sardinia was reckoned, along with Sicily, a granary of Rome. "*Scitilium et Sardiniam benignissimas urbis nostrae nutrices.*" (Val. Max. lib. vi. cap. 6.)

*Utrique frugiferis et insula nobilis arvis.*  
Nec plus Hebræum ingenuis uestibus ullis,  
Nec Romæ magis complerent horrea terre.

Lucan, iii. lln. 65.

But the unfavourable political and municipal regulations under which the island has latterly been placed, have gone far to neutralise the advantages it owes to nature. The agriculturists of Sardinia principally consist of two great classes—those who cultivate small farms on the *métayer* principle, and those who work on the estates of others, getting, in most instances, a patch of land for their support, and cultivating it at such times as they

are not employed on the lord's lands. Both classes are excessively poor. The agreements under which the former class hold are seldom for more than a year; the landlord furnishing the seed as well as the land, and receiving half the produce. Those who occupy land for which they are obliged to pay a rent in *corvées*, or other feudal services, are, if possible, still worse off; having usually to borrow the seed either from the landlord or from the *Monti Frumentarii* established for that purpose, and having also to defray the tithe and a host of other burdens. Another disadvantage, under which all classes labour, is the want of houses on their farms: the peasants live together in villages, and have frequently to perform a journey of several miles in going to and coming from their farms. Probably, also, this may, in some degree, account for the frequent change of occupancies by the Sardinian peasants; though, as Marmora has truly observed, their circumstances be rarely improved by such changes.

Lands belonging to a canton or commune are frequently cultivated on a kind of partnership system, being divided into three portions: one of these, called *vidazzone*, comprises all the lands that are in cultivation, and which are distributed by lot among certain individuals, while the other two portions are occupied in common as pasture. But, as a new distribution takes place every year, it is plain that no individual can have any interest in the improvement of the soil; and this sort of tenure becomes, in fact, the most effectual that can be devised for the extinction of industry. Latterly, however, the government has been making efforts to promote the formation of inclosures and the division of the lands; which, though opposed by the prejudices of the people, have made some progress. (*Marmora, Voyage en Sardaigne*, lib. v. cap. l.)

Even these, however, are not perhaps the greatest discouragements to agriculture. As if to annihilate the possibility of the peasantry emerging from their depressed condition, and to oblige them to confine their industry to the supply of their indispensable wants, it has been enacted that no corn shall be exported if its price exceed 30 reals the *starella*; and a heavy duty is laid on all that is exported, as a substitute for a general land-tax. Most other articles of export have been loaded with similar duties; and it would really seem that every device that ignorance and short-sighted rapacity could suggest had been practised to reduce this "benign nurse" of Imperial Rome to a state of poverty and destitution.

Happily, however, the bounty of nature has proved an overmatch for the perverse ingenuity of man; and such is the fertility of this fine island, that, notwithstanding the influence of the duty now referred to, and the wretched system of agriculture, it exports in good years about 400,000 *starelli*, or 500,000 bushels of wheat, 200,000 st. barley, 6,000 ditto maize, 100,000 ditto beans, 200,000 ditto pease, and 1,000 ditto lentils. The culture of the vine is gradually increasing in importance, and about 3,500 Catalan pipes are exported, chiefly from Alghero and Ogliastra. Olive oil, owing to the little care taken in its preparation, and its consequent bad quality, has hitherto been but little exported; but it is susceptible of an indefinite increase, and might be made an important article. Tobacco is a royal monopoly, and brings about 7 millions *livres* a year into the public treasury. Flax, lincseed, saffron, hemp, and barilla are grown to some extent; silk is produced only in limited quantities, but its produce might, no doubt, be vastly increased; some cotton is produced, and also small quantities of madder, which last grows wild in the island. The mountains are clothed with forests of oak, beech, chestnut, and other timber; but, from the want of roads, these are nearly useless. The agricultural implements and processes are excessively rude. The Sardinian plough, the counterpart of that described by Virgil, does little more than scratch the ground. It is without a coulter, and is very frequently wholly constructed of wood. Oxen only are used in ploughing and other field labour. Most of the garden grounds are wrought by the hoe, the spade and mattock being unknown, except to the Piedmontese labourers on the new roads. The corn is left in the fields till it be thrashed, an operation effected by the primitive practice of treading with horses and oxen.

We are glad, however, to have to state, that within the last few years some very important changes for the better have been introduced into the island, and that some of the worst of the abuses previously noticed have been obliterated. In 1836, in pursuance of inquiries previously commenced, feudal jurisdictions were completely abolished; and since then the feudal system has been wholly subverted. And if, as it is to be hoped, government follow up the enlightened course of policy on which it has entered, by giving freedom to commerce, the probability is, that the island will, at no very remote period, recover a large share of its ancient prosperity. According to a law passed in 1839, all lands were declared to be the property of individuals, communes, or the crown; the latter becoming the possessor of all waste lands, or those to which neither private parties nor communes could show any title. Lands

which had been cultivated or applied to use, whether enclosed or not, were assigned in perpetuity to the occupiers, undisturbed possession being held to confer a sufficient right to the property in the absence of any other title: those whose interests were at all affected by the new changes received compensation in money or lands, or by an assignment of public funded property. The king substituted himself in the place of the barons: he took all the feudal rents into his own hands; and their value being estimated at 20 years' purchase, public securities to the amount, bearing five per cent. interest, were made over to the nobles in exchange for the privileges of which they had been deprived. All kinds of vassalage were, at the same time, made redeemable; and costs of law placed under the direct control of the state were substituted in the place of the feudal jurisdictions where the barons were at once suitors and judges! It is impossible to overrate the importance of these changes; and there cannot be a doubt that they will have the greatest and most beneficial influence. (*Von Raumer, Italy*, &c., l. 295—301.)

The greater number of the oxen, horses, and other live-stock, wander wild over the island, bearing the mark of their owners, and browsing in the woods in winter, there being no wolves. They are generally, as might be expected, very inferior; but considerable pains are taken in the breeding of some descriptions of horses, and horse-races are a prevalent amusement. It is singular, notwithstanding the badness of the roads, that mules should be unknown. The Sardinian sheep is said, by Marmora, to be remarkable only for its degeneracy: its wool is of a very low quality, and is worth little, except in the island. Cheese, made of the milk of sheep and goats, is extensively exported; but this is a result, not of the goodness of the milk, but of its extensive supply, arising from the great number of these animals, there being about 800,000 sheep, and 550,000 goats. (*Marmora*, p. 414.)

The *mouflon* (the *Ophion* of *Pliny*, *Hist. Nat.* lib. xxxviii. cap. 9.), whence some naturalists suppose the sheep to be derived, is a native of Sardinia. "It is a ruminating animal, frequenting only the highest and most secluded woods; where, from its timidity and fleetness, it is with difficulty shot. The form of the ears, head, legs, and hoof, identify the mouflon with the sheep, though in size it be rather larger, and is, moreover, clothed with hair instead of wool. The horns are neither full nor deciduous, but hollow, and precisely similar to those of the ram, while the bleat is the same: it propagates also very readily with the sheep, the mixed produce being the 'umbró.' Though so shy in its wild state, the mouflon soon accommodates itself to domestic habits." (*Smyth*, p. 120.) Deer, wild boars, and a variety of game, abound in the forests; and the skins of about 50,000 rabbits and hares, from 4,000 to 5,000 foxes, and 2,000 martins, are annually exported, besides 5,000 cantars of *marmoset*, or dried skins, for making glue.

Though various improvements have been effected of late years, it is still true that the interior of this island exhibits, at this moment, a degree of barbarism which can with difficulty be believed to exist in Europe. The shepherds, and others who occupy the mountainous parts of the island, are in the habit of wearing only coverings of tanned leather, or of shaggy goat or sheep skins. They are constantly armed to protect themselves from banditti; roaming with their flocks over the uninhabited tracks, enjoying a bare subsistence, and acquainted with no laws but those of their own formation. They sometimes sow small patches of wheat and barley round their temporary dwellings; but they subsist chiefly on fruit, game, and the produce of their flocks, each family constituting as it were a patriarchal association. Though this part of the pop. be inoffensive, the number of banditti in the mountains formerly rendered it unsafe for any one, whether a foreigner or Sardinian, to venture far into the interior without an escort; and the farmers in the plains have been accustomed to rely for protection from the depredations of their highland neighbours on a long established corps, called the *barancelli*. This is an armed association, chosen annually in the village districts; the members of which are bound to make restitution for all thefts, provided they receive immediate intimation of the robbery. Their remuneration arises from an annual sum subscribed by every landholder. An attempt was made by the government, in 1819, to disband this force, but it was unsuccessful; and, on the whole, the *barancelli* are well adapted to the condition of the country.

The banditti that have long infested and still continue to infest parts of this island, owe their origin to a variety of causes, among which, no doubt, may be included the influence of the feudal system, and the opportunities afforded by the state of the country, full of natural fastnesses, without roads, and without an efficient system of police, for their carrying on their depredations with impunity. Latterly, however, some stringent measures have been adopted for their suppression. The privileges of

sanctuaries have been in most instances abolished. Roads have been made into districts that were previously inaccessible; the right to wear arms has been restricted; and these measures, combined with the abolition of the feudal system, and the establishment of royal courts for the speedy and more equal distribution of justice, will, probably in no very lengthened period, go far to suppress the robberies and assassinations which have so long disgraced the island.

The houses of the peasantry are most wretched, consisting usually of only one story without windows; or, if there be windows, they are not glazed. A whole family frequently dwells in a single room in which kids, chickens, and dogs, seek indiscriminate accommodation with the naked children; whilst an ass is usually employed turning a corn mill (*mola asinaria*) in the corner! The centre of the room has a square hole in the clay floor, for the fire, but there is no outlet for the smoke, except accidental holes in the roof or door. A few small low chairs, with an equally low table, constitute the usual movables. Earthenware not being common, the ordinary substitute is an oblong wooden dish. More flesh is used than in Sicily, but less poultry. Onions, cucumbers, &c., and raw vegetables, are favourite articles of diet.

The towns and villages are mostly large and well situated; but with unpaved, narrow streets, mean houses, and a want of every convenience. Immense dunghills, the collection of ages, disfigure the principal entrances. In the N. half of the island the villages are constructed of freestone or granite; but most of the country houses in the S. are built with sun-dried bricks made of mud and straw. In the towns some pretty good mansions are met with, though they are ill fitted up, and their *arraz* generally as dirty as those of the ancients in the days of Juvenal. (*Present State of Sardinia*, p. 164, &c.)

The fish on the coasts and in the harbours of Sardinia are mostly caught by foreigners; Sicilians, Neapolitans, Tuscans, Genoese, &c. Anchovies and pilchards have become rare; but in 1838, upwards of 17,000 tunnies were taken, besides several thousand liberated from the nets, from the fishermen not having the means of curling them. The lagoons of Oristano, Cagliari, &c. abound with fine mullet, bream, and eels. From 200 to 300 boats arrive every year from Naples and Genoa, to the coral fisheries on the coasts, each boat collecting, at an average, coral to the value of about 1,500 dollars.

Sardinia has ores of silver, copper, lead, and iron, which, if wrought, would, it is believed, be among the most valuable of her resources. But the code of regulations for the working of the mines proves an effectual obstacle to all mining speculations. It obliges speculators to work their mines under the direction of government engineers, or officers of the royal corps of miners, who are to be consulted and furnished with plans on the erection of smelting mills, &c. Speculators are also prohibited from exposing for sale, or exporting the produce of their mines, without permission from the intendant-general, and are, besides, to keep a journal of the daily produce of their mines, the same to be exhibited in a separate statement monthly at the intendant's office of the cap. district. (*Macgregor's Report*, 75.) The consequence is, that mining, and the quarrying of the fine porphyry, basalt, marble, &c. of the island, is almost wholly neglected.

Salt is a royal monopoly, and affords a considerable revenue. Until recently, Sweden drew almost all her supplies of this article from Sardinia; and it continues to be exported in considerable quantities. It is obtained by natural evaporation, principally near Cagliari. The expenses incurred by government in producing salt do not exceed 9 reals the salm; whereas the continental subjects of the crown buy many thousand salms at 50 dollars or reals each.

Except the royal gunpowder, salt, and tobacco manufactures, a few for cotton, woollen, and silk goods, and some coarse pottery and glass works, Sardinia has no manufacturing establishments, except such as are employed in preparing raw produce for sale. Very little skill is shown by any of the artisans; and watches, clocks, and even coarse cutlery are *all* imported. The want of roads has hitherto proved a serious obstacle to manufactures, as well as to every other branch of industry. A good road, practicable for wheel carriages, has, however, been formed within the last few years from Cagliari to Sassari, and cross roads are being carried from it to some of the most considerable places in the island. But previously, scarcely any roads were passable for travellers, except on horseback or on oxen, the *lettiga* of Sicily being unknown. A cart for luggage was indeed used; but this vehicle was a mere ladder mounted on solid wheels fixed to the axletree, and struck round the sides with triangular nails, being, according to Captain Smyth, a ruder machine than any he had seen in Spain, Greece, or Calabria.

The commerce of Sardinia has long been stationary, so

that a statement of its trade in 1824 will be nearly applicable to the present time. In that year the value of the principal articles of export and import were estimated as follows:—

Imports.		Exports.	
Articles.	Value.	Articles.	Value.
Timber, &c.	Fr. 250,372	Brandy, wines, liquors, &c.	906,871
Hosier	125,105	Grains, &c.	272,825
Hemp and cordage	153,065	Skins and leather	437,514
Cotton goods	1,032,693	Fish, cured and fresh	700,000
Drugs and spices	660,256	Salt	150,000
Woollen goods	627,782	Meats, forage & seeds	1,268,574
Hardware, and metals	203,338	Cattle	70,809
Skins and leather	266,217	Timber, &c.	191,854
Linon fabrics, &c.	215,400	Tobacco	50,000
Corn, &c.	160,514	Various	348,750
Various	1,174,568		
Totals	4,849,110		4,287,177

The custom duties received in the above year amounted to 997,232 fr. (*Marmora*, 460.)

Amounts (when not estimated, as above, in francs) are kept in lire, soldi, and denari: the lira of 20 soldi and 12 denari = about 1s 6d.; the real of 5 soldi = 4d.; the scudo of 10 reali = 3s. 9d. The Sardinian lb. of 12 oz. = 14 oz. 5 dr. avoird.; the rubbo = 26 lbs.; the moggio or stello (of corn) = about 1 bush. 1 peck. The palmo = 104 Eng. inches; the stello or moggio (of land) of Cagliari = 3 roods 27 poles 19 yards; of Sassari = 1 rood 38 poles 24 yards.

Sardinia is governed by a viceroy, whose commission generally lasts for 3 years, and who is the chief of the civil and judiciary administrations, and the commander of the forces both by land and sea. The island is subdivided into 2 grand divisions, those of Cagliari and Sassari, 10 provinces, 32 districts, and 368 communes. The seven cities, or principal towns, are under the administration of the magistrati, municipal bodies, each composed of 6 mems. Each commune has a council of 3, 5, or 7 mems., presided over by a sindaco. The *Udienza Reale*, created in 1661, and reformed in 1823, is the highest tribunal in the island. It is composed of 13 judges and 2 presidents, and is divided into 3 chambers, 2 civil and 1 criminal; and has at its head the regent, the first functionary in the island after the viceroy. Besides its functions as a supreme judicial court, it participates in the legislative power, the decree of the viceroy published with the concurrence of the *Udienza Reale*, having the force of laws. Sassari has a tribunal resembling the *Udienza Reale* of Cagliari, to which appeals may be made from its decisions. In the two cities last named are tribunals of commerce. In the provinces justice is administered by prefects, whose decisions are final in civil causes to the amount of 10 scudi, and who have primary jurisdiction in criminal cases. The *corte*, or district tribunals, have a very limited jurisdiction.

Sardinia has a parliament, called the *Stamenti*, consisting of three chambers: the ecclesiastical, selected from the prelates; the military chamber, comprising all the nobles, 30 years of age, with or without lieges; and the royal chamber, composed of the deputies of the towns and communes, under the *capo giurato* of the capital. The *Stamenti* are convoked and holden during the king's pleasure, but meet only on extraordinary occasions. Each section holds its sittings apart; and after separately discussing the matter under debate, they communicate by deputies. The deliberations of the ecclesiastical body, respecting donations, must be submitted to the pope for his approval, before passing into a law. The Supreme Council of Sardinia has its seat in Turin: it is composed of a president and five counsellors-senators, and is similar to the ancient Supreme Council of Aragon. Beyond this tribunal there is no appeal; and it gives its opinion in all state affairs transmitted to it from the government of the island. (*Report on Sicily and Sardinia*, p. 77.)

The laws of Sardinia are partly comprised in the code entitled the *Carta de Logu*, promulgated in 1395, and said to be drawn up, considering the period when it was issued, with great discretion and good sense. It has, however, been materially modified by the successive acts of the *Stamenti*, the edicts of the different sovereigns of the house of Savoy, and the *pregioni* or decrees of the viceroys. In consequence of the numerous and in many instances conflicting enactments that have thus been issued, the law has become exceedingly obscure. This encourages litigation, and the island is, in fact, to use the forcible expression of *Marmora*, *une mine inépuisable pour la chicane* (291). Recourse is had to the courts to determine the most trifling questions; and unfortunately the means of legal redress are at once tedious, expensive, and uncertain. "The country judges are extremely poor; and equality is so common, that sentences are just and equitable only when the government takes a criminal matter in hand. This is one of the leading causes of the assassinations that have so stigmatised the island. It is

an acknowledged difficult task to work a reform in detail; for if a magistrate prove himself more than usually active in his office, he is sure to receive the vengeance of adverse partisans; and the effect of the whole system and practice is a melancholy want of security both of persons and property." (*Smyth*, p. 135.)

Nothing, in fact, would do so much to put down crime, and to restore security and good order to the island, as the simplification of the law, and the nomination of superior and responsible judges. And now that the government has begun the work by the suppression of the feudal system, it is to be hoped that it will apply its energies to a reform of the abuses in the judicial system.

No religion, other than the Roman Catholic, is tolerated in this island; and the secluded position and ignorance of the people have prevented the growth of any heresy, so that in this respect Sardinia boasts a higher purity than even Rome herself.

The island is divided into 3 archbishoprics; those of Cagliari, Sassari, and Oristano; and 8 bishoprics. Tithes are rigorously exacted. The revenues of the church are estimated by Serristori at 960,000 Italian lire, of which sum the secular clergy, amounting to between 1,800 and 1,900, receive about 264,000. According to Marmora (p. 324), there are 90 conventual establishments for monks, of whom there are about 1,130; and 14 similar establishments for nuns.

Public education in Sardinia has, of late years, been considerably improved. "There are now normal schools in each of the 10 provs., attended by about 6,650 pupils. There are, besides, secondary schools in the two principal towns, Cagliari and Sassari, which are frequented by about 1,350 students. The university of Cagliari reckons about 265 students, and that of Sassari 225. The course of studies is divided into theology, jurisprudence, philosophy, medicine, and surgery. By an ordinance of the late king, in 1823, every village or commune has now a gratuitous school for reading, writing, arithmetic, religious instruction, and the elements of agriculture. The effect of the diffusion of instruction among the people, aided by a better system of administration and police, is already visible in the decrease of crimes, especially murders, which, from the frightful amount of 150 yearly, in a pop. of about half a million, had been reduced in 1828 to 90." (*Journ. of Educ.*, vol. p. 23.)

A voluntary regiment of 1,400 chasseurs is levied and maintained in Sardinia, for the service of that island. Respecting the rest of the armed force, &c., the reader is referred to SARDINIA, KINGDOM OF.

The finance department is managed by an intendant-general in Cagliari, and vice-intendant in Sassari, and a sub-intendant in each of the other provs. The public receipts in 1824, amounted to 2,437,362 fr.; the direct taxes amounting to 1,006,250 fr. The paper money in circulation, in 1806, amounted to 3,840,000 fr.; but, in 1825, it had all been withdrawn, except 480,000 fr.

According to Captain Smyth, there is a striking resemblance between the Sards and Greeks. "It is impossible," he says, "for any one who has travelled in Greece, not to be struck with the similarity which, in many points, exists between the Sards and the Greeks. Not only are their arms, music, dances, dresses, and manners in close resemblance, but many of their words and superstitions are exactly the same; so that the opportunities I have had of comparing the two nations, would lead me to infer the partial identity of their origin. The Sards are of a middle stature, and well-shaped, with dark eyes, and coarse black hair; except in the mountains, where fresh complexions and blue eyes are met with. They have strong intellectual faculties, though uncultivated, and an enthusiastic attachment to their country. They are active, when excited, but extremely indolent in general. Their good qualities are counterbalanced by cunning, dissimulation, and an insatiable thirst for revenge." (*Smyth's Sardinia*, pp. 141—192, &c.)

Though vassals in Sardinia could change their lord and residence at will, the degrading services and tenures of feudalism were in full vigour in most parts of the island down to its abolition in 1839. The dependence of a peasant on his lord commenced when he was deemed capable of earning his bread; and an annual tribute, either in money or kind, was exacted from all above the age of 18; and this, in addition to the usual imposts on lands and stock; the contributions demanded for prisons, robberies, arson, and exemptions from the *roadia*, or one day's personal labour, as well as from other domical services. These feudal burdens, with tithes, taxes payable to the king, alms, as they are called, to mendicant monks, and other grinding extortions, amounted, in many instances, to nearly 70 per cent. of the earnings of the peasant. And if, to this amount of taxation, be added the vicious customs that have prevailed in the letting of land, unintelligible laws, and verbal barages of the peasants, and that revenge has become, in their estimation, a sacred duty.

The Sards are enthusiastically fond of poetry, but the other fine arts have met with no encouragement; and there is not a native painter, sculptor, or engraver, of any eminence in the island; and the press being under a rigid censorship, the current literature, if so it may be called, is beneath contempt. The language of Sardinia is that dialect of the Italian, which preserves the greatest portion of Latin.

We have little authentic information respecting the history of this island previously to its conquest by the Carthaginians, from whom it was taken by the Romans in the third Punic war. On the fall of the Western Empire, it was successively possessed by the Vandals, the Goths, the emperors of the east, and the Moors; from whom it was taken, in 1023, by the Genoese and Pisans. It continued to be a subject of contention between these rival nations till 1325, when it was taken possession of by the kings of Aragon, and it remained attached to the Spanish monarchy till 1714, when, by the peace of Utrecht, it was ceded to Austria. In 1720, the latter exchanged it for Sicily with Victor Amadeus of Savoy. Previously to the French Revolution, the Sardinian government is said to have been desirous to sell the island to the Empress of Russia for 1,000,000*l.* sterling; but the scheme was defeated by the interference of France and Spain. (*Young's Travels*, ii. 256.) It was unsuccessfully attacked by the French in 1793; and on the seizure by the latter of the continental portion of the Sardinian dominions, Cagliari became the residence of the royal family. Recently an already existing measure, which promises to be of the utmost importance to the island, have received the sanction of the government. (For further information, see *Marmora, Voyage en Sardaigne*, Paris, 1826, an elaborate and valuable work; *Smyth's Present State of Sardinia*, in great part derived from the former; *Parl. Report on Sicily and Sardinia*; *Dict. Géog.*; *Serristori, Statist. d'Italia*, &c.)

SARDINIA (KINGDOM OF, Ital. *Stati Sardi*), a state of S. Europe, comprising the whole of N. Italy W. of the Tessino, including the territory of Piedmont, Genoa, and Nice, and the adjacent duchy of Savoy on the W. side of the Alps, with the island of Sardinia in the Mediterranean, nearly the whole of these dominions being included between the 35th and 46th degs. of N. lat., and the 5th and 10th of E. long. Its divisions, area, pop., &c. are as follow:—

Divisions.	Area in sq. m.	Pop. census of 1838.	Pop. to sq. m.
Savoy	4,270	564,137	132.1
Turin	3,186	873,310	274.3
Coni	2,714	566,181	208.7
Alexandria	4,039	395,563	292
Novara	2,692	512,728	201.6
Nice	1,619	230,718	142.5
Aosta	1,254	78,110	62.3
Genoa (and Capraja)	2,105	674,988	320.6
Island of Sardinia, &c.	9,241	584,653	57
<b>Totals</b>	<b>29,102</b>	<b>4,650,368</b>	<b>160</b>

The insular portion of this kingdom being described under the previous article, we have now to detail only that of the continental portion, lying between lat. 43° 40' and 46° 24' N. and long. 5° 35' and 10° 55' E., baying W. France, N. Switzerland, E. Austrian Italy and Parma, and S. the Mediterranean. The Alps separate this territory into three great divisions: Piedmont in the centre, forming the upper part of the valley of the Po; Savoy, a rugged and mountainous region on the W. and N.W.; and the prov. of Genoa, Nice, &c., in the S., between the Maritime Alps and Apennines, and the sea.

The most valuable portion of the kingdom is the plain of Piedmont, extending from the foot of the Alps to that of the Apennines on the S., and to the Tessino on the E. The soil is every where a rich, sandy loam, with little appearance of clay, and of great fertility. Owing to the great heat of the climate in summer, water is here the great desideratum; and advantage has accordingly been taken of the numerous streams that percolate down from the mountains, which are distributed with infinite skill all over the low grounds. Nowhere, indeed, is the art of irrigation carried to greater perfection than in that part of the great plain of the Po included in Piedmont. "Water is here measured with as much accuracy as wine. An hour per week is sold, and the fee simple of the water is attended to with the same solicitude as that of the land." (*Young*, ii. 160.) The irrigated lands being under the influence of a southern sun, produce the most luxurious crops.

Lands in Piedmont are mostly inclosed, generally by ditches, but in many parts, with hedges also, while in some districts the crops in the best English cos. The crops, however, are generally divided by lines of fruit trees of different kinds, intermixed with mulberry trees, poplars, and oaks; and that the benefit of these trees may not be limited to the shade they produce, they support vines. Speaking generally, farms in Piedmont are small, and are usually held on the *metayer* system, the

landlord receiving half the produce, and paying the taxes and repairing the buildings. On the whole, however, the agriculture of this part of the Sardinian dominions bears so close a resemblance to that of the rest of Lombardy, that we beg to refer the reader for further particulars to the art. ITALY (AUSTRIAN) in this vol.

Few countries have so large a disposable produce as Piedmont. It has an immense number of cities and towns; and yet the Riviere of Genoa, Nice, and the country as far as Toulon, are supplied with corn and cattle from its superabundant produce. The produce of maize is considerable; and it constitutes the principal support of the country population, who make use of it under a variety of forms. The most usual course of husbandry consists of what would be called in England a four-shift, the first year being maize, the second wheat, the third clover or fallow, and the fourth wheat. It is customary to mix French beans and hemp along with the maize. Wheat is sown on narrow ridges, and is earthed over by the plough; which in Piedmont is an implement of a better kind than in most parts of Italy. Wheat harvest takes place in the beginning of July: it is thrashed by means of cylinders drawn by horses over the straw, which is turned up by forks. According to Arthur Young (li. 209.), the common produce of the wheat crops in Piedmont does not exceed six times the seed; which, considering the quality of the soil, he is justified in calling "miserable;" but the better crops yield between 10 and 11 seeds, or even more; and with a better rotation, and more care, this might be made the average produce of the plain.

To the corn crops must be added those of hemp, which is sometimes considerable, and silk, for which Piedmont is famous, with wine, vegetables, and fruit: the produce of the farm-yard, and the profit of rearing and fattening stock. The latter branches are the principal sources of profit from cattle; for though the latter be very abundant in Piedmont, the farmers have not learned, like those of the Milanese, to derive much advantage from their milk. A farm of medium size was estimated by Chateauneux to consist of about 60 acres, 1-4th being in pasture. Such a farm would support a family of 8 or 9 persons, maintain upwards of 20 head of live stock, produce silk to the value of 25*l.* a year, and more wine than was required for home consumption. The crops of maize and French beans go far to maintain the labourers, so that nearly the whole crop of corn may be carried to market, as well as a considerable quantity of the inferior articles. (*Chateauneux*, 30, 31.)

Savoy, which is remarkable for the grandeur and beauty of its scenery, though a poor country, produces enough to supply the wants of its inhabs. The peasants are all, or mostly all, proprietors. The plough is of use only in the valleys; on the high grounds the peasants break up the soil with the pick-axe and spade, and, to improve it, carry up mould and manure in baskets from the valleys. Small reservoirs are prepared near the tops of the hills and mountains, from which water is let out at pleasure in spring and summer; while, to prevent the earth from being washed down the declivity, small stone walls are erected, so that, by dint of skill and industry, cultivation is extended over tracks which would otherwise be a continued surface of naked rock.

Wheat, oats, barley, rye, and hemp, are the principal grains cultivated; in some favourable situations the vine is grown; and the white wine of Montanera is especially esteemed. The walnut is the olive of Savoy, supplying the inhabs. with oil, not only for home consumption, but also for exportation to France and Geneva. The kernels are crushed by a mill, into a paste; which is pressed to extract the oil, and afterwards dried in cakes called *pain amer*, eaten by children and poor people. A good many cattle and sheep are reared, and driven for sale into Piedmont and Lombardy. The butter and cheese of Savoy are of good quality, and are important products. Many mules and horses are bred for the transit trade between France, Germany, and Italy.

The olive, though but little grown in the other parts of the kingdom, is the chief article of culture S. of the Apennines. The land in the Genoese territory is generally hilly and rocky; but has mostly a S. aspect, suitable for the olive alone. The cultivated land is supposed to comprise about 1-4th part of the surface. The land here is divided into very small farms, those near the towns comprising only about 6 acres, and those in the interior about twice as much. Only a small proportion of the land is cultivated by proprietors: it is usually let on leases of 3, 5, 7, or 9 years, but never more; the rent of cultivated land near Genoa is very high.\* In the greater part of the Genoese territory the

\* It is stated, in a report from Genoa, in the *Parl. paper*, No. 84, sess. 1836, that the average rent of cultivated land near Genoa varies from 30*l.* to 34*l.* an acre; that wood and pasture land, in a good situation, fetches 15*l.* an acre of rent; and that the rent of "rocky land," where sheep and goats are fed, is 4*l.* an acre! We apprehend that this is pretty much on a level with the statement in another *Parl. paper*, that the government of Tamboff, in Russia, produces annually 38,000,000 quarters wheat! (See *Tamboff*.)

rent is paid in cash or in produce, as wine, oil, grain, &c. rated at a fixed price; but in the provs. of Novi and Levante the rent is paid, as is usual in the rest of the kingdom, on the *metayer* principle; the landlord furnishing the land and 1-3d the seed, and receiving 2-3ds the produce. Wheat and maize are generally sown alternately on the same land; and good land is said to yield usually from 4 to 6 for 1, or double that quantity when it is tilled with the spade, as is customary in some parts. Each farm of 4 or 5 acres supports a family. Labourers get from 3*l.* to 5*l.* a year, with board and lodging. Their usual diet consists of Indian corn, chestnuts, potatoes, beans, and fruit; making little or no use of butchers' meat. Women work in the fields, and tend the cows, in addition to spinning, weaving, and other domestic work, in which they are very industrious. The occupiers of farms are not in a prosperous condition; and we may add, that they never will be in such condition while farms are so very small, and held under such a tenure. Paupers, however, are more numerous in the towns than in the country. The government makes no provision for the support of the poor; but there are various private charities for their assistance. (*Parl. Rep. on Agriculture*, 1836.)

The mineral riches of this country are little explored; but iron of good quality, lead, copper, sulphur, manganese, and cobalt, abound in the mountains of Piedmont and Savoy. The mines of Pesey, in the Tarentaise, formerly yielded from 30,000 to 40,000 cwt. of lead, and about 4,000 marcs silver a year. Alabaster, fine marble, serpentine, slate, &c. are plentiful. Salt is found both in mines and in springs; and near Montiers are government salt-works, said to produce 3,000,000 lbs. a year. There are some forges, and other iron-works; but the principal manufactures consist in silk stuffs, velvets, and stockings, mostly consumed in Italy. Coarse woollen and linen goods are made in several provs.; and coarse stuffs for the rural pop. in Savoy. Salt-cloth, cables, house furniture, paper, white lead, glass, earthenware, optical and surgical instruments, jewellery, and works of art and *virtu*, are among the articles made at Genoa, Nice, and other principal towns; and there are numerous brandy and liqueur distilleries, and tanneries.

*Trade*.—It is difficult to form any fair estimate of the trade of the Sardinian dominions; a large proportion of the imports not being destined for the supply of the country, but merely for transit to France, Switzerland, Germany, &c., and no distinction being made between these portions. In fact, if we may depend upon the following returns of the trade of the kingdom in 1835, it would appear that, with the exception of raw silk, olive oil, and woollen fabrics, the imports of all the great articles exceeded the exports. The articles of export not included among those imported, consist of rice, paper, and vermicelli. It is abundantly certain, however, that the exportation of raw and silk stuffs, including velvets, exceeds very considerably the imports of such articles retained for home use, as is the case with oil, flax, and various other articles.

ACCOUNT OF THE VALUE OF THE PRINCIPAL ARTICLES IMPORTED INTO AND EXPORTED FROM THE SARDINIAN STATES BY SEA, IN 1835.

Imports.	Exports.	
	Francs.	Francs.
Corn	9,757,000	2,644,500
Cocoa	347,500	1,475,000
Coffee	2,377,400	771,100
Hemp	1,217,100	841,600
Cotton wool	3,241,100	671,700
Cotton yarn	540,000	1,142,700
Cheese	1,147,500	19,504,000
Olive oil	15,524,000	979,500
Indigo	1,127,200	1,624,900
Woollens	5,375,400	2,984,000
Hides	5,700,000	3,668,000
Salt fish	3,284,000	1,748,500
Raw silk	2,705,400	2,405,000
Sugar	15,510,200	3,984,700
Tobacco	4,354,800	4,281,500
Cotton stuffs	15,519,300	1,111,400
Woollen do.	4,980,100	12,444,000
Flax and hemp do.	1,205,800	5,509,600
Silk do.	4,794,700	1,180,300
Wines	1,951,300	3,653,200
Other articles	22,675,500	45,928,900
Total	120,765,100	85,685,900

Of the above imports, those from Great Britain amounted to 22,696,800 fr.; France, 22,135,700 fr.; Naples and Sicily, 21,715,500 fr.; Austria, 8,320,100 fr.; Brazil, 5,416,100, &c. Of the exports those to France were the largest, amounting to 27,719,100 fr.; those to Austria amounted to 14,535,300 fr.; to Naples and Sicily, 9,954,500; and those to Great Britain only 1,350,000 fr. During the same year there entered the different ports of the Sardinian states 2,927 ships, of the aggregate burden of 268,109 tons, of which 87 ships of the burden of 16,068 tons were from the United Kingdom. Genoa, Nice, and

Capigliari, especially the first (which see), are the principal seats of the foreign trade of the kingdom. Thus, in 1835, the import and export trade of the arrondissements of Genoa, Nice, Capigliari, and Port Maurice, were as follows:—

	Imports.	Exports.
	<i>Frs.</i>	<i>Frs.</i>
Genoa - - -	96,198,700	63,015,100
Nice - - -	20,146,100	19,188,600
Capigliari - -	4,061,400	2,271,600
Port Maurice - -	48,900	910,700
Totals - - -	120,755,100	85,685,900

Some of our readers may, perhaps, be disposed to conclude, seeing the wide discrepancy between the value of the imports and exports in the above accounts, that one or both of them must be wholly erroneous. But though we should not certainly be inclined to guarantee their authenticity, the discrepancy in question does not prove their inaccuracy; inasmuch as the countries that received the goods at second hand through the Sardinian dominions, may have paid them otherwise than by the export of produce through them.

All transit duties on goods passing through the Sardinian states have been abolished. The duties on consumption in the interior of the kingdom are moderate. The imports of corn are principally from the Black Sea, but partly also from Sicily.

The government is a monarchy, hereditary in the male line; and though the regal authority be, in some degree, circumscribed by a Supreme council in the island of Sardinia, it is absolute in the continental portion of the kingdom. It has, however, been a constant object of government to restrain the extravagant privileges of the nobility, clergy, and corporations, and to enlarge the rights and immunities of the bulk of its subjects. Hence, says Count Pecchio, "Piedmont was the first country which, in 1729, abolished nearly the whole system of feudal authority and personal service, leaving scarcely any but honorary privileges in force. It then also limited the right of primogeniture and of entail, and consequently gave greater scope to the free cultivation of the soil; and diminished the powers of the clergy, more particularly that of investing land in mortmain. These constitutions were revised and confirmed in 1770." (*Hist. of Pol. Econ.*, p. 232.) The king is assisted in his administration by five ministers, or secretaries of state, for the Interior, War, and Marine, Finance, Justice, and Foreign Affairs; and by a council of state, consisting of a president, 14 ordinary, and an unlimited number of extraordinary members. In each prov. the whole power of government is in the hands of an Intendant, who, like all other functionaries, is appointed by the king; who, of course, may, also, dismiss him at pleasure. Intendants of an inferior grade are appointed for districts and towns, who manage all the public business of their respective localities, though every town has also a magistracy, varying in its number of members according to circumstances, which regulates its municipal and private affairs. In each district is a judge, with authority in civil causes, to the amount of 300 lire; but from whose decision appeal may be made, when the amount exceeds 100 lire. Each of the 37 provs. has a tribunal, with a president, from two to six councillors, a government advocate, &c. In 1838, a new code of laws for the Sardinian States was adopted, which, though certainly an improvement on the heterogeneous code it replaced, exhibits some glaring defects. Among others, the use of torture is retained in certain cases; the most arbitrary means are used to extend the Roman Catholic religion; and Jews are subject to the most illiberal restrictions. Duelling is punished with death, even though neither combatant should be killed or wounded. The whole population is Roman Catholic, except about 7,000 Jews, 21,000 Waldenses in the N.W. part of Piedmont, and a few Protestants in Genoa, and elsewhere. Public instruction is less diffused than in Austrian Italy, and is in general of a very inferior kind. It is wholly under the direction of a central board in Turin, entitled the *Magistrato di Riforma*, which has under it a council *di riforma* in each province. The principal university at Turin has four faculties, and about 1,200 students. Genoa, also, has a university, and there are secondary universities at Chambéry, Asti, Mondovì, Nice, Novara, Saluzzo, and Vercelli, with 27 royal colleges in the larger, and 54 communal colleges in the smaller towns. The professors may be either clergymen or laymen, but where the candidates are otherwise equal, clergymen are always preferred. Foreign books pay an oppressively high duty; and the censorship, being, at the same time, rigid in the extreme, all but insuperable obstacles are opposed to the dissemination of sound information as to politics and political economy. But, despite this jealousy, it is due to the Sardinian government to state that it has of late discovered a very enlightened spirit, and done much for the

improvement of its subjects; and schools and colleges, as well as most branches of the public service, have been materially ameliorated. Various new and wholesome laws have been enacted for the regulation of communes, roads, weights and measures, sanitary police, vaccination, prisons, forests, the game laws, &c. A good many roads, canals, and bridges, have been constructed, and hospitals, museums, baths, and public establishments of all kinds have been founded; the harbours have been improved; light-houses and barracks built, and the army has been thoroughly re-organised.

The Piedmontese infantry is composed of two classes of soldiers, viz., the permanent and the contingent (Provincial). The former serve 8 years in the standing army, and at the end of that term receive their discharge from all future service. The latter serve nominally 16 years, during 8 of which they are considered as forming part of the standing army, and the remainder they belong to the reserve. They are consequently divided into 16 annual contingents, 8 for the first period, and 8 for the second. Each soldier has to perform active services for 14 months after his enrolment, on completing which he may return home, but is subject to be called upon during the remainder of the first term of 8 years to re-enter temporarily the ranks, for the annual formation of a camp of manœuvres, or upon any occasion of state emergency. The Sardinian army on the peace establishment consists of about 22,000 men; but in time of war it may be raised to 132,000 men, of whom 67,200 are infantry, 50,000 depot and reserve ditto, 6,000 cavalry, and 6,300 artillery men. Perhaps no country in Europe has a better organised army, or a finer soldiery, in proportion to its extent. The subaltern and field officers are, in general, a fine body of young men, well educated in the duties of their rank. But the general officers are not supposed to possess the experience adequate to the proper exercise of their commands, inasmuch as they mostly owe their rank to court intrigue and royal favour, and not to the value or length of their services. In this respect, however, Sardinia is not singular. Napoleon and Frederick the Great selected their officers, because they were aware of their merit, and cared for nothing else. But ordinary sovereigns can do nothing of the sort; and court favour and parliamentary influence, without regard to merit, must, speaking generally, be at all times omnipotent in the disposal of places in the army, as in every thing else.

The Public Revenue and Expenditure for 1839 were estimated as follows:—

Revenue.	<i>Liri.</i>	Expenditure.	<i>Liri.</i>
Customs and taxes on consumption - - -	12,500,000	Royal household, &c. - - -	4,000,000
Direct taxes, &c. - -	27,200,000	Justice - - -	4,200,000
Foreign and post-office - - -	2,500,000	Foreign affairs - - -	3,000,000
Interior (incl. mines) - -	300,000	Interior - - -	7,400,000
Coinage, &c. - - -	200,000	War-office - - -	1,100,000
Treasury fees, interest, &c. - -	900,000	Artillery - - -	2,000,000
Naval department - - -	200,000	Navy - - -	3,100,000
		Finance - - -	6,100,000
		Customs - - -	6,500,000
		The queen-dowager - - -	260,000
		The Prince of Carignano - - -	150,000
		Public debt - - -	8,000,000
Total - - -	73,600,000	Total - - -	74,170,000

According to the above statement the expenditure would appear to exceed the income; but such is not really the case, the above being merely the estimated amount of the revenue, which, for several years past, has been considerably under its real amount. In 1837 there was a surplus of 2,300,000 lire over the expenditure. The only exemptions from the land-tax are in favour of the royal palaces, domains, and manufactories; the residences and gardens of the clergy, churches, and churchyards. The public debt is about 145,000,000 frs., bearing interest at 4 and 5 per cent. The credit of the state is high; a consequence partly of the progressive reduction of the debt, and partly of the punctual payment of the interest. (*Von Raumer's Italy*, 1. 236—274.)

Savoy was the nucleus of this monarchy. It was governed, as early as the 10th century, by its own counts, whose descendants acquired Nice in 1399, and Piedmont in 1418. The sovereigns of Savoy and Piedmont were long celebrated for their ability and the skill with which they preserved and extended their limited dominions, notwithstanding the difficulty of their position in the immediate vicinity of the great European powers.

This territory was recognised as a separate kingdom at the peace of Utrecht, in 1713. Sicily was then added to the Piedmontese dominion; but, in 1720, it was exchanged for the island of Sardinia. Genoa and its territory, Monaco, &c., were annexed to the Sardinian crown at the peace of 1815. (*Serristorf, Statistica d'Italia, Von Raumer's Italy*, &c., 1. 208, 300; *Châteaueuf, Young*, &c.)

**SAREPTA**, a town of European Russia, near the frontiers of the government of Saratoff, on the Sarpa, near its confluence with the Wolga. Pop. above 3,000. This town was founded, in 1765, by a colony of Hernaltters in Moravia; it is well built, neat, clean, and fortified, so as to be secure from the predatory incursions of the contiguous nomadic tribes. Its inhabs. are distinguished by their industry; they manufacture linens: silk and cotton stuffs, with stockings and caps, in great request all over the empire. They also raise and manufacture tobacco, distil spirits, &c.

**SARGUEMINES**, a town of Persia, dép. Moselle, cap. arrond., on the Sarre, 41 m. E. by N. Metz. Pop., in 1836, 4,113. This town, under the name of Guemond, was formerly one of the strongest in Lorraine; but no portion remains of its ancient fortifications except a dismantled citadel, now appropriated to the *gendarmerie*. The sub-prefecture, hall of justice, and college, occupy the buildings of a Capuchin convent, founded in 1721. There are some spacious prisons. Sarguemines has manufactures of cotton thread, forks, spoons, and earthenware of a superior quality; and is the *entrepôt* for the *papier-mâché* snuff-boxes made in the surrounding villages, and of which it is said to export 100,000 dozen a year. (*Dict. Géog.; Guide du Voyageur*.)

**SARI**, a very ancient city of Persia, prov. Mazandaran, of which it is the cap., about 18 m. from the S. shore of the Caspian, and 115 m. N. E. of Teheran. Previously to 1836 it is said to have had from 30,000 to 40,000 inhabs. who carried on a brisk trade with Astrakhan, and the interior of Persia (see *Frazer's Trav. on the Caspian*, p. 11.); but about that time it was nearly depopulated by the plague. "Sari is surrounded by a ditch and a mud wall, flanked by pentagonal brick towers. The gateways have fallen down, and roads have been broken through the wall in every direction. The appearance of the town differs essentially from that of any other in Persia S. of Elburz. The houses are built of burnt brick, and neatly tiled; some of the streets are well paved; and, although the marks of ruin are every where visible, Sari has something of the appearance of an English village, or small market-town." (*Major d'Arcy Todd, in Geogr. Journal*, viii. 101.) Sari is frequently mentioned by the poet Ferdousi. Its vicinity is flat, woody, and well watered. (*Kianier's Persian Empire*, 163.)

**SARK**, or **SERCQ**, one of the islands belonging to Great Britain in the English Channel, lat. 49° 28' N., long. 2° 21' W., intermediate between Guernsey and Jersey, 7 m. E. the former, and 9 m. N.W. the latter; breadth, and greatest breadth, about 2 m. each. Pop., in 1841, 41. It is divided into two portions, Great and Little Sark, united by a narrow neck of land. It differs little from the adjacent islands in its physical features.

The soil is sandy, and produces most kinds of grain and vegetables. A good many fish and sea-fowl are taken round its coasts. The inhabs. make cheeses, and knit stockings, gloves, Guernsey jackets, &c.; which they send to the ports in the W. of England, in exchange for colonial and manufactured goods.

**SARNO**, a town of the Neapolitan dom., prov. Principato-Citra, cap. cant., at the head of the river Sarno (an. *Sarnus*), 114 m. N.W. Salerno. Pop. estimated at 12,000. It is a well built and flourishing town, having a handsome cathedral, several convents, an old castle, belonging to the Barberini family, a seminary, hospital, some sulphurous baths, and manufactures of paper and copper wares.

Sarno is celebrated in history for the desperate battle fought in its vicinity, anno 553, between the troops of Justinian under Naras, and the Goths under their king Totas. The entire defeat of the latter, and the death of their monarch, terminated the Gothic kingdom and power in Italy. (*Gibbon*, vii. 391.; *Craven's Tour in the Abruzzi*, &c., li. 185-188.)

**SARTHE**, a dép. of France, reg. N.W., between lat. 47° 35' and 48° 40' N., and long. 0° 25' W. and 0° 50' E.; having N. Orne, E. Eure-et-Loir and Loir-et-Cher, S. Indre-et-Loire and Maine-et-Loire, and W. Mayenne. It is of a compact shape, 60 m. in length, N. and S., by about the same in breadth, E. and W. Area, 621,600 hectares. Pop., in 1836, 457,372. Surface generally level, except in the N.W., where there are a few hills. The principal rivers are the Sarthe, with its tributaries the Vègre, Huisne, and Loir. The Sarthe rises near Mortagne, in the dép. Orne, and runs with a very tortuous course, S. and S.W., to the vicinity of Angers; near which it receives the Loir, and unites with the Mayenne to form the Maine, after an entire course of nearly 160 m. In the 15th century it was navigable to Le Mans, but its navigation is now difficult for some distance below that city. Besides Le Mans, Alençon stands on the Sarthe. The soil of this dép. is very various; in some parts there are rich lands, but poor sandy tracts predominate, especially in the S.E. In 1834, the arable lands were supposed to comprise 393,456 hectares, meadows 58,120 ditto, vineyards 10,081 ditto, orchards 19,479 ditto, and woods 68,319 ditto. Wheat, barley, and rye are the principal

corn crops; and are sufficient, along with potatoes, so which at least 1,150,000 hectol. were raised in 1835, for the consumption of the pop. The produce of wine is not enough for the consumption; but about 220,000 hectol. of cider and perry are said to be annually manufactured. Live stock pretty abundant and good. Bees are but little reared; and the wax, in which Le Mans has a considerable trade, comes mostly from the neighbouring dép. In 1835, of 124,521 properties subject to the *contrib. foncière*, 46,667 were assessed at below 5 fr., 22,949 at from 5 to 10 fr., and 20,482 at from 10 to 20 fr. Hardware, paper, woollen fabrics, leather, wax, candles, sail-cloth, glass and earthenware, soap, and other articles of necessity, rather than of luxury, are the goods principally manufactured in Sarthe. The iron forges, &c., produce annually about 1,000,000 kilogr. of good iron. The *clannings* of Maine formerly enjoyed a great celebrity, but other fabrics have superseded them; so that St. Calais, and other towns where they were chiefly made, have fallen into decay. Sarthe is divided into 4 arronds.; chief towns, Le Mans the cap., La Flèche, Mamers, and St. Calais. It sends 7 mems. to Ch. of Dep. Registered electors, in 1838-39, 2,345. Total public revenue, in 1831, 10,533,207 fr. In this dép. the females among the peasantry, and even in the classes above them, appear to enjoy but little consideration. "Si la *maîtresse* la forme et se laisse au monde: Est-ce un gas? Quand le contraire arrive, on dit: 'Où ça n'est qu'une créature' (une fille), et, en effet, un homme a ici quatre ou cinq fois autant de valeur qu'une femme. Telle forte et robuste servante, propre à tous les ouvrages, ne gague que 36 fr. et sa nourriture par an, tandis qu'un laboureur est payé de 150 à 200 fr. pour l'année." (*Hugo, art. Sarthe*, *Dict. Géog.; French Official Tables*.)

**SARUM** (OLD), an ancient, and now totally ruined city and bor. of England, co. Wilts., on a hill, 2 m. N. Salisbury, or New Sarum, which-see. It was the *Sorbidunum* of the Romans; and, being surrounded by walls and defended by a castle, became a place of considerable consequence under the Saxons. Under William the Conqueror the bishop of Shireburn and Sumring removed his see thither; and such was its importance, that parliaments were held in it under subsequent Norman kings. But it always laboured under various inconveniences, the principal of which was the total want of water; and in consequence of this, and of disputes between the crown and the church as to the possession of the castle, the inhabs. began gradually to remove to the more convenient situation of New Sarum, or Salisbury; and the seat of the bishopric being translated to the latter, in the reign of Henry III., Old Sarum fell into a state of total decay, and was almost wholly deserted in the early part of the reign of Henry VII. For a lengthened period there has been hardly even any vestiges of its ruins. (*Condor, Gibson's ed.*, p. 114.)

Old Sarum sent 2 mems. to the L. of C. in the reign of Edward III.; and notwithstanding its total decay, the proprietor of the burgage tenures in the bor., or of the land on which it once stood, was permitted to exercise this important privilege in its name down to the passing of the Reform Act, when it was disfranchised. Not having a single house or inhabs., Old Sarum afforded the most perfect example of a nomination bor. The property several times changed hands; and though the estate was of little intrinsic value, the privilege it possessed of manufacturing two law-makers for the British empire, made it sell for a very large sum. It may well excite astonishment that such an outrage on the principle of representation should have been permitted to exist for so lengthened a period.

**SARUN**, a district of Hindostan, presid. Bengal, prov. Bahar, and one of the richest and most prosperous in British India, between lat. 25° 30' and 27° 30' N., and the 84th and 86th deqs. of W. long.; having W. Gornickpoor, S. Ghazepoor, Shahabad, and Patna; E. Tirhoot, and N. Nepaul. Length, N. to S., about 110 m.; breadth, varying from 25 to 80 m. Area, 5,760 sq. m. Pop., in 1822, 1,461,075. It is well watered; the Ganges forms its entire S. boundary, and the Gumuck intersects it near its centre; it supplies in abundance all the principal products of the East, besides good timber for ship-building, masts, spars, &c. There is little jungle or waste land; cattle, though not numerous, are of good quality. Manufactures few; the principal is that of saltpetre, a great deal of which is produced in this district. The Mohammedans form but a small portion of the entire pop. Chief towns, Chumrah, Bettiah, and Maissy. Total land revenue, in 1829-30, 15,603 rupees. (*Hamilton's E. I. Gaz.; Part. Reports*.)

**SASSARI**, a city of Sardinia, cap. of its N. division, in the N.W. part of the island, on the Turritano, about 10 m. from its mouth at Porto Torres, in the gulf of Sassari, 58 m. N. by W. Oristano, and 100 m. N.N.W. Cagliari. Lat. 3° 30' N.; long. 8° 35' 20" E. Pop., in 1838, including its commune and port of Torres, 21,108. It is surrounded by a wall, strengthened by square towers, with five gates and a citadel, the latter being now

used merely as a barrack. It has a good main street; and is surrounded by public walks, shaded by trees. Sassari has numerous churches, convents, and nunneries, a Tridentine seminary, and a public hospital. The cathedral, a massive structure, has a disproportionately large, and very elaborate facade; but its interior is clean and airy, and it has several good sculptures, including a monument by Canova. The university is established in the former Jesuit College. The palace of the governor is an extensive edifice, and the public buildings in general are well adapted for their intended purposes. There are some pretty good inns and coffee-houses, and the shops are fully equal, if not in some instances superior, to those of Cagliari. (*Smyth's Sardinia*, pp. 267, 268.) It is the seat of an archbishop, of a tribunal of secondary jurisdiction, with appeal to the *Audienza Reale* of the island, and of a tribunal of commerce; and is the residence of the vice-intendant and vice-treasurer of Sardinia, and of a military governor. It has a considerable trade in tobacco, oil, fruits, &c.

Porto Torres (ant. *Tharros*), its port 10 m. distant, can only accommodate small vessels; ships of large size being obliged to anchor in the roads nearly one mile outside, where, however, the anchorage is pretty good. Sassari rose on the decay of Turris, during the insecurity of the middle ages. Agriculture appears to be better conducted in its vicinity than in any other part of the island. Immediately without its walls is the fountain of Rosello, an abundant source of water, embellished with much architectural ornament. (*Smyth's Present State of Sardinia*; *Official Reports*, &c.)

SASSBACH or Saltzbach, a village of the Grand Duchy of Baden, built with Achern, at the foot of the mountains of the Black Forest, on an alluvial of the Achern, 17 m. E.N.E. Strasburg. This village, which has about 1,000 inhabitants, has acquired a high degree of historical interest from the famous Marshal Turenne having been killed in its vicinity, by a random shot, on the 27th of July, 1675. The circumstances attending the death of this great general have been detailed by Voltaire (*Siecle de Louis XIV.*, cap. 12.), and other distinguished writers. His remains, deposited by order of Louis XIV. in the royal burying-place in the abbey of St. Denis, escaped, at the era of the Revolution, the fanatical violence that scattered the dust of so many kings. At length, after various vicissitudes, they were deposited in the church of the Invalids, by order of the still more illustrious captain now entombed within the same sacred precincts. A monument, in honour of Turenne, erected in 1751 on the place where he fell, was destroyed in 1801 by Moreau, and was reconstructed of granite in 1820. The funeral orations in honour of Turenne, by Flechier and Mascarou, are *chef-d'œuvre*.

SATALIEH, or ADALIA. See ADALIA.

SATTARAH, a considerable town and fortress of Hindustan, prov. Bejapoor, about 6 m. S.E. Poonah. Lat. 17° 42' N.; long. 74° 12' E. The fort stands on a steep hill; at the foot of which is the town, built partly of stone, and partly of mud or unbaked bricks, but comprising no edifice of note, if we except a new palace built within the last 20 years. The fort, though naturally strong, was taken by Sevaljee from the Bejapoor sovereign in 1673, by Aurangzeb in 1690, and by the British in 1818. The British cantonments are about 2 m. to the E. Sattarah was under Sevaljee and his immediate successors, the cap. of the Mahratta Empire. The Sattarah rajahs, however, had been reduced to the condition of *rois fainçants* by their ministers, the Peshwas, for a lengthened period previously to 1818, when the British vested the rajah with a limited authority over a portion of the dominions of his ancestors. The Sattarah territories since then have comprised an area of about 8,000 sq. m., with a pop. of, perhaps, 15 millions. In his evidence before the committee of the H. of C., in 1830, Colonel Briggs stated, "The administration of the government of Sattarah may be deemed a good specimen of the management of a native government. The country is divided into districts, each yielding from a lac to 1½ lac of rupees, containing from 150 to 200, and even 300, villages. Over this district is an officer, and a subahdar. That district is then subdivided among a great number of junior officers, each having from 6 or 8 to 20 villages under his charge. The whole civil and judicial business is conducted through those officers. The annual assessment of the land is fixed with reference to the sum yielded in former years; the assessment varying every year with the quantity of land cultivated. The revenue is always paid in money." In 1828, it amounted to about 15,000,000 rupees. This state was subsidiary to the British till about 1839, when the rajah, having been detected in a conspiracy against the British authorities, was dethroned, his dominions having since that time been amalgamated with and administered under the Bombay Presidency. (*Hamilton's Gazetteer*; *Parl. Reports*.)

SAVANNAH, a city and port of entry of the U. States, state Georgia, on the river of its own name, about 12 m. from its mouth, and 80 m. S.W. Charlestown; lat. 32° 2'

N., long. 81° 3' W. Pop., in 1840, 11,214. It stands on bluff sandy point, rising about 40 ft. above the river from which it has an imposing appearance; its spacious and regular streets, and handsome public buildings, being interspersed with many trees, &c. Previously to 1834 when it suffered from a terrible fire, it was mostly built of wood, and it was formerly also insalubrious from the contiguity of rice swamps. This evil has, however, been effectually obviated; and being now principally of stone houses, it is one of the handsomest towns in the S. states. It has numerous churches, an exchange, U. States branch bank, an academy, &c. Its trade is considerable: in 1836 it exported 229,360 bales of cotton, of which 157,210 were for foreign ports; it also exports considerable quantities of rice; and the aggregate value of its exports may, perhaps, amount to from 14,000,000 to 15,000,000 dollars. In 1838, the aggregate burden of the shipping belonging to the port amounted to 16,668 tons. (*Official Reports*; *Encyc. Americana*; *Encyc. of Geog. Amer.*, edit.)

SAVE (Germ. *Sau*, an. *Sarvus*), a river of the Austrian empire, and one of the principal tributaries of the Danube. It rises towards the N. extremity of Carinthia, at about lat. 46° 30' N., long. 13° E., and runs at first S.E. through the government of Laybach and Croatia, to about lat. 45° 15', long. 17°. It thence has more of an E. direction, forming the boundary line between the Austrian prov. of Slavonia on the N., and Turk. Croatia, Bosnia, and Servia on the S., till it enters the Danube at Belgrade, after a course of about 500 m. (*Berghaus*). Its chief affluents are the Kulpa, Una, Verbas, Bosna, and Drina. Though not very rapid, its inundations are often very destructive. Being navigable as far as the mouth of the Kulpa, for vessels of from 12 to 200 tons, it is a good deal used for commercial purposes. Few towns of any consequence are, however, situated on its banks, the principal being Breda, 24 m. Krainburg; Laybach, Agram, Pettau, and Pöchlarn; however, at no great distance, and some of them situated on its tributaries. (*Berghaus*, *Allg. Erdk.*, *Oest. Nat. Encyc.*)

SAVERNE (ant. *Taberna*), a town of France, *dep.* Bas-Rhin, cap. arrond., on the Zorn, a tributary of the Rhine, 19 m. N.W. Strasburg. Pop. in 1836, ex. com., 5118. Though finely situated, it is but indifferently built, and has no remarkable edifice, except an old palace, formerly belonging to the bishops of Strasburg, but now used for the police barracks and prison. The town is manufactures of woollen cloths, hosiery, hardware, &c., with some trade in timber, floated down from the Vosges by the Zorn.

SAUGUR, or SAUGOR, a large town of Hindustan, prov. Malwa, in the ceded districts on the Nerbudda, lat. 23° 48' N., and long. 78° 47' E.; taken by the British in 1818.

Saugor is also the name of an island of the Sunderbunds, at the mouth of the Hooghly, about 60 m. S.S.W. Calcutta. A railway to connect it with that city was projected a few years ago, and is now probably completed.

SAUMUR, a town of France, *dep.* Maine-et-Loire, cap. arrond., on the Loire, 28 m. S.E. Angers. Pop. in 1836, ex. com., 11,576. The Loire here forms several islands, and is crossed by five or six bridges, one of which, a stone bridge of 12 arches, 384 yds. in length, long considered as one of the finest in France, connects the town with its suburb of La Croix Verte. Saumur is built partly at the foot, and partly on the declivity of a hill crowned by a citadel. Its lower portion is tolerably well laid out, and has a handsome quay and terrace facing the river; but the upper town is irregular, and the streets inconveniently steep. The castle, which appears to have been constructed at different periods between the 11th and 13th centuries, was the occasional residence of the kings of Sicily and the dukes of the house of Valois: for some time previously to the Revolution it was a state prison; it now serves as an arsenal. There are several churches worth notice; one of which, famous from its antiquity, is supposed to have been constructed in the 4th or 5th century; and another, *Notre-Dame des Ardilliers*, is remarkable for its beauty; having a fine dome supported by Corinthian columns, an altar-piece by Philip Champaigne, &c. The barracks are among the best of that description of edifices in France; they are four stories in height, and can accommodate 1,200 men. The town-hall, public library, public baths, and theatre, are the other principal buildings. Not far from the town is a famous riding-school. It has manufactures of linen cloths, handkerchiefs, necklaces, copper, and iron wares, leather, saltpetre, &c.; with a brisk trade in provisions, and 4 large annual fairs. Ingits says he "greatly prefer Saumur as a residence to Angers; it is more airy and lively, the country quite as beautiful, and provisions are a shade cheaper." (*Switzerland*, &c., p. 347.)

Saumur was taken in 1026 by Fulk of Anjou, and, after many vicissitudes, was annexed to the French crown in 1570. A Protestant academy, founded here by the famous

Duplessis Mornay, the friend of Henry IV., governor of the town for a lengthened period, was dissolved by Louis XIV. in 1684. (*Itugé*, art. *Maine-et-Loire*; *Guide du Voyageur*; *Dict. Géog.*)

SAVONA, a town and sea-port of N. Italy, in the Sardinian States, div. Genoa, cap. prov. on the Mediterranean, 20 m. S. W. Genoa. Pop. (1838), with comm., 16,211. It has ramparts, which, however, are of no great strength, and many good public and private buildings; but its streets are narrow, winding, and badly paved. It had formerly two harbours, the best of which was filled by the Genoese in 1523, from jealousy of its capabilities; the other, formed by a mole 140 p. long E. into the sea, is small, and is rather difficult of approach, from the accumulation of sand and mud near its mouth. Savona is a bishop's see, and the seat of judicial and commercial tribunals; it has manufactures of silk goods, iron and earthenware, and exports oranges and lemons, grown in its vicinity. Savona was the birthplace of Popes Sixtus IV. and Julius II., and is said to have been for some time the residence of Columbus. Pope Pius VII. was also detained in it in 1810-11, by order of Napoleon. (*Dict. Géog.*, &c.)

SAVOY. See SARDINIA (kingdom of).

SAXONY (KINGDOM OF), a secondary state of Central Europe, and of Eastern Germany, principally between lat. 50° 10' and 51° 30' N., and the 12th and 15th degs. of E. long.; having W. the Hupde, Saxon principalities; N. Prussian Saxony and Brandenburg; and S. Bohemia. It is of a triangular shape. Length, E. to W., about 140 m.; greatest breadth nearly 90 m. The area, pop., subdivisions, &c., are as follow:—

Circles.	Area in sq. m.	Pop. 1837.	Pop. to sq. m.
Dresden	1,670	430,817	252
Leipzig	1,358	367,753	271.8
Zwickau	1,786	681,572	382.5
Budissa	965	292,913	272.4
Total	5,789	1,636,198*	281.1

\* This is exclusive of the troops, which, when added, raise the total pop. to 1,652,114.

The *Erzgebirge* (ore mountains), and the *Riesengebirge* (giant mountains), extend along almost the whole of the S. and S.E. frontier, but they nowhere rise to 4,000 ft. of elevation. Their declivity is more gradual and undulating on the Saxon than on the Bohemian side; so that they cover the greater part of the country with their ramifications, rendering it either mountainous or hilly. There is, however, a very considerable extent of level ground, extending from the foot of the hilly tract, or from Colditz, Meissen, and Bautzen, northward, all along the frontier of Prussian Saxony. The country to the S.E. of Dresden, where the Elbe forces its way through the mountain chain, has been called the "Saxon Switzerland." It is about 30 m. in length by 24 in breadth, diversified, and highly picturesque; but its name is likely to convey a wrong impression of its scenery, its highest summit, the *Schneeberg*, being only 2,150 ft. in height. The spurs given off by the *Erzgebirge* to the N. enclose the valleys of the Elbe, the two Muldas, the *Lothaupten*, *Elster*, *Peisse*, &c., all of which flow to N.W. and, except the first, which is navigable throughout the whole extent of the kingdom, lie in Saxony.

Saxony has a milder climate than most parts of continental Europe in the same lat.; the mean temp. of the ear is about 47° Fah.; that of the winter quarter being 35°, and of the summer 59°, at an average of the entire country, which has a mean elevation of about 1,100 ft. above the sea. Landed properties are rather of limited size; but in the rural districts the people appear to be contented and, on the whole, comfortable; pauperism is rare, according to Mr. Gleig, "There is, perhaps, no country in the world where more is made of the land than in Saxony. Every spot of earth which would be capable of giving a return is cultivated; and the meadows are mowed twice or thrice in the course of each summer. You never meet with such a thing as a common or waste, while the forests are all guarded with a strictness proportionate to their value. As farmers, I should say that the Saxons were more clean and industrious than the English. The fields are always well cleared of weeds, and in their crops they have a succession: but the favourite grain is rye; and either because it does not require to be pampered, or that manure is a scarce article with them, they do not seem disposed to fatten the soil so frequently." (*Germany*, &c., i. 237-38.) Rye, wheat, and barley are scarcely grown, except in the low country; in the mountain region they are met with only in the valleys, oats and potatoes being the chief crops. Beans, vetches, millet, tassel, flax, oil seeds, tobacco, and arden vegetables, are pretty generally cultivated; and

artificial grasses are nearly universal. But, notwithstanding the improvement of agriculture, and the industry of the people, considerable quantities of corn have to be imported. A great deal of fruit is grown; and between 7,000 and 8,000 morgen of land are occupied with vineyards. In 1835, upwards of 53,000 cimers of wine were made, some of very tolerable quality. The forests, which occupy about 1-4th part of the entire surface, consist of fir, pine, beech, oak, elm, maple, larch, &c. Upwards of 1-3rd part of the woods belongs to the crown, yielding an annual revenue of 2,000,000 dollars; and nearly 10,000 individuals are engaged in wood-cutting.

Saxony is celebrated for her breeds of sheep, which are among the finest in Europe. The late king, when elector of Saxony, introduced the breed of Merino sheep into his dom., and exerted himself to promote the growth of this valuable race of animals with such success, that they are now found to succeed better in central Europe than in Spain; and, notwithstanding the rapidly increasing importations from Australia, the greater portion of the immense quantity of wool that we import still continues to be brought from Saxony and other German states. According to Berghaus, there are only 626,000 sheep in the kingdom; but we apprehend that there must be some signal error in this statement, and that their number must be very materially greater. Indeed, they are stated in *Hirschbach's Sheep* (i. 475.), to exceed 2,000,000. We may farther state that, in 1837, Prussian Saxony had above 2,000,000 sheep; and though it be more extensive than the kingdom of Saxony, we believe it is not so well stocked as the latter. The best wool is produced on the sheep-walks of the Saxon Switzerland. The cattle of Saxony, the number of which exceeds 550,000, are also of a superior description; but the butter is usually indifferent, while, to increase its weight, it is frequently overloaded with salt. But, such as it is, the demand for it is universal. "Never," says Mr. Straug, "did I witness so much butter daily consumed, as I have seen since I entered this kingdom. Here, in short, bread and butter is the order of the day at all hours. It is the perpetual family staple, and essential as a make-weight at every meal. You find it with equal propriety at breakfast, at lunch, at dinner, and at supper. A farmer in Saxony may well be called the *buttery*!" (*Germany*, &c., i. 140.) Horses are not so extensively reared as other live stock, and hogs are not numerous. The game laws are very rigidly enforced, all sorts of birds being included in their enactments; and rights of fishing, &c., appear to be preserved with the most scrupulous tenacity.

Mining is one of the principal occupations of the inhabitants. Few parts of Europe equal the *Erzgebirge* in the variety and extent of their mineral riches. The basis of these mountains is granite, covered by gneiss, mica, and clay slate in succession, between which are other strata containing metallic ores. Upwards of 500 mines are wrought, which are said to employ about 11,000 workmen; and between 50,000 and 60,000 persons, or about 1-30th part of the entire pop., derive their subsistence from mining industry and the manufacture of metallic products. The total annual value of the metals obtained is estimated, by Berghaus, at 1,700,000 dollars; the silver producing nearly 930,000, and the iron and iron-wares 400,000 dollars. Lead, bismuth, arsenic, antimony, cobalt, and manganese are the other principal metals. Freiberg (which see, i. 808.) is the centre of the silver mining district. The neighbourhood of Meissen yields the fine porcelain clay, of which the "Dresden China" is made. About 1½ million *schefel* coal are annually produced. Salt is scarce, since the salt mines, formerly included in the Saxon kingdom, were separated from them in 1815, and this important necessary is mostly imported from Prussia. Serpentine marble, and fine building stone, are abundant; as are various gems, including the topaz, jasper, agate, tourmaline, &c.

The most important branch of manufacturing industry in Saxony is that of cotton. Its extension has been attributed to the nearly contemporaneous introduction of the potato, called by German writers the "manna of the mountains," and which has enabled the Saxon weaver to obtain a sufficiency of food at exceedingly low wages. In 1830, there were in Saxony 86 spinning establishments, having 361,292 spindles, employing 5,380 adults, and 2,443 children; of these establishments, only 3 were wrought by steam. In 1837, there were 121 spinning establishments, with 490,325 spindles. (*Börsing's Rep. on the Prussian Commercial League*, p. 35.)

Most descriptions of cotton fabrics are now produced, and many new factories have been established in Chemnitz, Zwickau, Auerbach, Freyburg, &c. Great efforts are making to improve the construction of machinery; and joint-stock companies for the purpose have been established near Chemnitz and Dresden. Coal has within these few years increased in the neighbourhood of Dresden; and it is said that the mines are becoming productive, and promise a good supply. Cotton-printing works are on the increase, and have been much improved

† It is obvious from this extract, that Mr. Gleig knows nothing of agriculture; but his testimony as to the appearance of the country is, notwithstanding, of some value.

within the last few years. Although the Saxon prints, in general, are not equal to the best English in beauty of pattern or brightness and fastness of colouring, they are said to make up for these deficiencies by the cheaper rates at which they can be produced. (*Keyser, in the Handloom Weavers' Report*, part II. 510, 511.) The only article, however, in which the Saxons come into competition with us in the American and other foreign markets is cotton hosiery, particularly the inferior descriptions. Dr. Bowring says that he has seen some stockings intended for the American markets which were sold at the rate of 3s. 4d. a dozen! The number of stocking-frames amounted, in 1815, to about 9,000; in 1831, to 14,000; and in 1836, to 20,000. The number of master-workmen, in 1831, was 7,165; hired workmen, 3,444; apprentices, 2,852; in all, 13,461 persons. The number of frames in work was 13,841, and the average weekly return per frame was 1 doll. 4 gr., = 3s. 4d. sterling. There is no branch of industry which seems more appropriate to Saxony than this. It requires only a small outlay of capital for the stocking-maker; his wooden frame is not expensive; the cost of his stock of cotton twist is small; and by associating agencies with manufacturing industry he supplies himself with a very little yarn with the principal necessities. If we may depend on the statements of Bowring and others, it would appear that the stocking-weavers of Saxony are in a state of progressively increasing prosperity. Most of them are independent labourers, buying for themselves the raw material and selling their manufactured stockings to a number of small collectors, who furnish the Chemnitz or the Leipzig markets. (*Bowring's Report*, p. 36.)

We confess, however, that we are not a little sceptical as to several of these statements, and have very great doubts whether persons in the condition of the Saxon stocking-weavers can ever come into competition with those of England in the production of hosiery, but the coarsest description of goods. In illustration of what is now stated, we may mention, that during the year ended the 31st of September, 1839, hosiery of the value of 412,410 dollars was imported from the Hanse Towns into the United States, of which, probably, the principal portion was from Saxony; and this, with yarn of the value of 22,310 dolls., made up the whole of the imports of cotton goods into the United States from these ports in the course of that year! (*Official Report by Congress*.)

The manufacture of linen in Saxony is also of considerable importance. The weaving business employed, in 1839, from 12,000 to 13,000 looms; of which about 950, employing about 3,500 persons as weavers, loom-builders, pattern-drawers, &c., were appropriated to the weaving of damasks and table-linen. The weekly earnings of the damask weavers vary from about 2s. 3d. up to 7s. 6d.; but for white linens the utmost amount of a man's wages, per week, would be from 2s. to 2s. 4d. sterling. The spinning of flax employs numerous hands; and next to and next about 10,000 cat. of yarn is annually imported from Silesia, Bohemia, &c., and lately there have been considerable importations from England. (*Handloom Rep.*, p. 511.)

In 1837 there were in Saxony 126 establishments for spinning woollen yarn, with 71,066 spindles, and 18 establishments for combed yarn, with 30,765 spindles; making together 101,831 spindles, being an increase of 30.1 per cent. since 1831, and of 127 per cent. since 1831. The progress of the Saxon cloth manufactures in the three years from 1834 to 1837 is stated, in an official report, to have been greater than in the 30 years preceding! Great improvements have been introduced, not only in the fabric, but in the finish of woollen goods, particularly by the introduction from the Netherlands of a new steam brushing machine. In 1839 the woollen manufacture employed from 3,000 to 4,000 looms, which produced about 160,000 pieces of cloth. Much attention has been paid of late to the manufacture of machinery; though it is still far behind what is met with in the manufacturing districts of Great Britain. The Jacquard loom is gradually being introduced, and there are schools of manufactures at Dresden, Chemnitz, Plauen, &c. Plain and figured silks, of very fair quality, are made at Annaberg, Peitz, and Trautenburg. The government is very desirous of promoting the culture of silk, and some establishments for the propagation of the worms exist at Dresden and Leipzig; but in such a climate they can hardly be expected to have much success. Woollen wares are made in the country, of the estimated value of about 200,000 dollars a year (*Berghaus*); and Saxony supplies furniture of every description, musical instruments, &c., to a great part of Germany. Porcelain, and modern antiques, are articles made in large quantities, particularly at Meissen. The china produced here formerly enjoyed a very high reputation throughout Europe, but, owing to the extraordinary improvements made in the manufacture in this and other countries, Meissen china has declined considerably in its ancient celebrity. Almost every article of use or luxury is made

in Saxony; the chief deficiency is in paper, of which the Saxon manufactures do not produce nearly enough for the immense consumption of the presses of Leipzig and Dresden.

The extension of the cotton and woollen manufactures of Saxony, since 1833, is wholly, or almost wholly, ascribable to the circumstance of her having then joined the Prussian Commercial League. This opened a widely extended market for her products among the German States, from the greater number of which they had previously been either wholly excluded, or admitted only clandestinely, and under great difficulties. Saxony, in fact, has derived the greatest advantage from the League, much more, in proportion to her extent and population, than Prussia. Little or no cloth of Saxon manufacture has hitherto found its way to the United States.

The extensive commercial relations of Saxony owe their origin to the enlightened policy of Frederick Augustus, the Elector, afterwards, King of Saxony, who, at a time when protecting and prohibitory tariffs surrounded his states, adopted a liberal commercial system, and converted Saxony, and especially Leipzig, into one of the most important marts, not merely for the supply of central and northern Europe, but part even of Asia, with all sorts of manufactured produce. The fairs at Leipzig were for a lengthened period the great sources whence Russia, as far as the borders of China, Poland, the provinces on the Danube, and many parts of the Turkish and Persian dominions, were supplied with manufactures; and though they have latterly declined, they still continue to be much resorted to. Leipzig has been for a lengthened period the centre of the book trade of Germany, being, London and Paris only excepted, the greatest literary emporium in the world. The value of the works sold at the Easter fair of late years has been estimated at about 3,000,000 dollars; and as many as 600 booksellers are said to have been assembled at some of these fairs, from all parts of Germany to dispose of their publications and adjust their accounts! (*See Leipzig*.)

The Convention dollar, coined in Saxony, = 32 *ratengroschen*, or 4s. 1½d. Engl.; the Saxon dollar of 21 gr. is an imaginary coin. 100 Dresden *schellings* are equivalent to 155 of Berlin. The other measures, &c., are comparatively unimportant, and the coins of Prussia are generally current.

**Government.**—Saxony is an hereditary and limited monarchy, having a senate or upper house, and a house of representatives. Previously to 1830, it had states; but these had comparatively little power; and the imposition of taxes and other public burdens, and the regulation of the public expenditure, mostly depended on the pleasure of the king. But the French Revolution of 1830 was specially followed, in Saxony, by some very important political changes. The king was obliged to associate his nephew, the present sovereign, with him in the government, a representative system was organised on a new principle, and the abuses incident to the feudal system were suppressed.

The senate consists of 52 members, and the house of representatives of 300. Of the senators, some take their seats by virtue of their offices, as the Rom. Cath. bishop, the king's principal chaplain, a Protestant bishop, the dean of the university, and one or two great officers of state. Of the remainder, some sit in the right of their estates, and transmit their privileges, as senators, with their estates, to their children; while others are elected for each parliament by a constituency of their own order. The qualification for a seat in the senate is the same that is required to entitle a man to vote in the election of a senator, viz. a landed estate worth 6,000 dollars a year. The lower house is elected by a species of household suffrage, or by such heads of families as contribute in any way to the public burdens. The candidate must possess property to the amount of 1,000 dollars a year. Senators receive 7 dollars a day during the sitting of parliament, and deputies 3 dollars. But owing to the high qualification required for deputies, and other causes, the new constitution is not so popular as might have been expected. "Though," says Mr. Gleig, all "money-bills must needs, as among ourselves, originate in the Ch. of Dep., the minister has but to propose his plan through an agent, and he is sure to carry it. Meanwhile the constituency, especially in the rural districts, complain loudly that their parliament is worse than useless; that it saddles them with burdens which, under the old system, they were not required to bear; that now they have 350 sovereigns to maintain instead of one! The rigid censorship still exercised over the press keeps the Saxon public profoundly ignorant of what is passing in their parliament; though as to speaking, such a thing is unknown in the Ch. of Dep. In the upper house the case is somewhat different; for it is composed of men who do occasionally speak." (*Gleig's Germany* in 1837, i. 182—194.)

But with all its defects the newly organised representative system is of great importance to the kingdom; and it will, no doubt, acquire greater influence and influence

pendence according as experience makes the deputies better acquainted with their rights and duties.

Perhaps, however, the inroad made on the feudal system, which was maintained in the rural districts nearly to the fullest extent, was the most advantageous of the various changes effected in 1830.

Hereditary jurisdictions were abolished, except in very rare cases; and the more oppressive privileges enjoyed by the lords were, at the same time, suppressed. All towns now elect their own municipalities, and are governed by laws of their own making; while the rural districts, being divided into departments, each of which has its own magistrates, whom the people not only choose, but may, also, in case of misbehaviour, degrade from office. The municipal officers, also, though elected by the citizens for life, are liable, on conviction of incapacity or unfair dealing, to be degraded. Their powers are very considerable in reference both to person and property, for they regulate the police, hear and determine civil causes, and both fix the amount of local rates to be levied on the citizens, and determine how the produce shall be expended. In the election of the magistrates, every rate-payer has a voice. They are all salaried officers. It is necessary, however, to enable any one to be appointed to the magistracy office, that he should have received a legal education, and be possessed of some small portion of land, and of the house in which he resides.

There are civil and criminal courts in the cap. of each circle, and a high court of appeal in Dresden, in which latter all capital cases are tried. Executions take place by decapitation. There are special military tribunals, a superior fiscal court, university court at Leipzig, mining tribunal at Freiberg, patrimonial tribunals, &c. The reigning family is Rom. Catholic, but there are not more than 29,000 Rom. Catholics in the kingdom, the great bulk of the pop. being Lutherans. Literature and the fine arts have flourished more in Saxony than in any other part of Germany; and there is scarcely any country in Europe where primary instruction is so widely diffused: the number of the individuals attending schools, and other seminaries, is said to be as high as one in six of the population. The university of Leipzig is the principal seminary.

Every male inhab. 20 years of age is, with certain exceptions, obliged to serve in the army for six years in time of peace, and for three years subsequently in the reserve corps. The armed force is pretty extensive; it consists of about 13,000 men, of whom 10,000 are privates under arms; besides the reserve corps of 3000 more. This kingdom holds the 4th rank among the German states, having four votes in the full diet and one in committee, and furnishes a contingent of 12,660 men to the army of the Confed. Its public revenue from 1810 to 1812 has been fixed at 5,500,297 doll., and its expenditure at 5,421,755 doll. At the end of 1838 the public debt amounted to 10,926,457 doll.

The Saxons are among the best specimens of the old Teutonic race. In person, manners, &c., travellers have remarked that they bear a striking resemblance to the English agricultural pop. The Saxon royal family is said to be descended from Witichind, sovereign of this territory in the time of Charlemagne.

Saxony was created an electorate in 1422, which title it retained till 1806, when Napoleon erected it into a kingdom. During the late war the king of Saxony was, from the battle of Jena downwards, a firm ally of Napoleon, who made extensive additions to his dominions; and he did not abandon the fortunes of his benefactor till after the battle of Leipzig had compelled the French to evacuate Germany. This conduct led to the dismemberment of the kingdom by the treaty of Vienna in 1815: some of its most valuable provinces were then assigned to Prussia; and, but for the opposition of Austria, it is probable that Saxony would then have ceased to exist as a separate state. (*Berghaus, Allg. Länder, &c.; Stein; Straug's Germany and the Germans; Gleig's Germany, &c.;* passim.)

SAXONY, a prov. of the Prussian states, consisting of the territories dismembered from the kingdom of Saxony in 1815, with the Saxon states formerly belonging to Prussia, has on the N.E. and E. Brandenburg, S. the kingdom of Saxony and the Thuringian states, and on the W. Hesse, Brunswick, and Hanover. It is of a very irregular outline, has several *enclaves*, and includes within its frontiers the independent principalities of Anhalt, Sondershausen, &c. Area, 9,765 sq. m. Pop., in 1837, 1,539,353, of whom 1,437,353 are Protestants, and 97,002 Catholics. It is divided into three regencies, and these again into 41 circles. Principal towns Magdeburg, Halle, Erfurt, Merseburg, Naumburg, Burg, &c. The Harz mountains lie on the W. frontier of the prov.; but, with this exception, there are no hills of any considerable magnitude. Principal rivers, the Elbe and its affluent, the Saale, Mulda, Unstrut, &c. Soil in parts sandy and unproductive, but in general loamy and fertile. The plain of Magdeburg is reckoned about the best land

in Prussia, and is very well cultivated. Principal products, wheat and other sorts of corn, flax and hemp, excellent wool, tobacco, &c. The vine is cultivated in the neighbourhood of Merseburg and some other places. Productive mines of coal, iron, rock-salt, &c. are wrought in different parts of the province. The stock of sheep exceeds 2,000,000 head, and wool, which has been vastly improved by crossing with merinos and other fine-woolled breeds, has become a staple product. Manufactures important and valuable, consisting of fine woollens, linens, earthenware and porcelain, hardware, &c.

SCARBOROUGH, a sea-port, port, and mun. bor., market-town, and par. of England, N. riding, co. York, and E. div. of the wap. of Pickering Lythe, on a rocky slope, rising from an extensive bay, 35 m. N.E. York. Area of par. bor. (which includes, with the old bor. and par., the extra parochial dist. of the castle), 2,160 acres. Pop., in 1831, 8,769; in 1841, 10,060. It has a very striking appearance from the sea, from which it rises amphitheatrically to a considerable height. It is well built; the streets in the upper part of the town are spacious and well paved; and the houses generally have a handsome appearance. It is also extending S.W. towards Falsgrave, and southwards along the shore. The principal public buildings are the town-hall, trinity-house, news room, assembly-rooms, a neat and well-conducted theatre, a sea bathing infirmary, 6 bathing establishments, and 2 public libraries. But the handsomest and most classical building belonging to the town is the museum, a rotunda 37½ ft. in diameter, by 50 ft. in height, in the Roman Doric style. It is constructed of the Kelloway limestone, a fine building material, presented from his extensive quarries at Hackness, by Sir J. V. B. Johnstone, Bart. M.P. for the bor.; and though of recent erection, has a valuable collection of specimens illustrative of the geology and natural history of the N. riding. A fine iron bridge, 4 arches, supported on massive stone piers, 70 ft. in height, has been thrown across a ravine to connect the higher town with the spa, ½ m. to the S. This handsome structure, which cost 9,000*l.*, raised by subscription, was completed in 1828. The par. church, which was given by Richard I. to the abbey of Cîteaux, in Burgundy, stands on an eminence not far from the ruins of the castle; it was formerly much larger than at present; but the part now used is commodiously fitted up for divine worship. Christ-church, built, in 1824, of stone furnished by Sir John Johnstone, in the early English style, has accommodation for 1,350 persons. A chapel of ease was erected in 1840, in the lower part of the town, near the quay side, by voluntary subscription, principally for the accommodation of the poor: it contains nearly 500 sittings, of which about three fourths are entirely free. There are places of worship, also, for R. Catholics, Wesleyan, primitive and association Methodists, Independents, Baptists, and the Society of Friends, to most of which, as well as to all the churches, are attached well-attended Sunday-schools. A grammar-school, founded in the 19th century, is but slenderly endowed; but there are several good subscription-schools, including two on the National and one on the Lancasterian plan. The Amicable Society also clothes and educates between 70 and 80 boys and girls. A seaman's hospital is under the government of the Trinity House, and there are almshouses, and several other benevolent, as well as religious institutions.

The harbour, which is easy of access, is protected by a handsome stone pier, of modern erection; but unfortunately it labours under a deficiency of water, having only from 4 ft. to 5 ft. at low ebb springs, and from 8 ft. to 9 ft. at low ebb neaps; but from first quarter flood to last quarter ebb, vessels drawing 8 ft. water may enter the harbour with safety. A small foreign, and pretty considerable coasting-trade is carried on. In 1840 there belonged to the port 35 ships, of the aggregate burden of 32,867 tons. During the same year the gross customs' duties amounted to 1,887*l.* 7*s.* 2*d.*; there has, however, owing to the privilege of bonding having been conferred on the port, been a remarkable increase this year (1841) in the amount of the duties; the receipts for the 11 months ending 30th Nov. being 3,721*l.* 12*s.* 3*d.* A great deal of fish is brought in here, and forwarded to the populous districts in the West Riding; and of late years several persons have embarked in the herring fishery which is becoming an important and profitable source of employment to the fishermen. From 40 to 50 yaws belong at present to Scarborough and Filey, in addition to the numerous small boats used for fishing in-shore; and it is not unusual for 150 or 200 boats to enter the harbour, during the season, at the same tide with herrings. As an encouragement to the fisheries, the corporation remit the title of fish to which they are entitled; and a society has been formed to raise an honorary fund, to meet the casual losses of nets, lines, and tackle, of such provident fishermen as become subscribing members; and thus insuring to them, at a slight charge, an assured, bonus protection.

\* Since the peace, ship-building, which formerly con-

tributed in no slight degree to the prosperity of the town, has greatly declined, and now has almost ceased; nor, from the shallowness of its artificial harbour, is it ever likely to become a very important trading place. It is supported by the resort of strangers to it for the purposes of sea-bathing and amusement; and these are principally of the middle classes, and from the manufacturing districts of Lancashire, Durham, and the W. riding of Yorkshire." (*Parl. Bound. Report.*) Scarborough is, however, frequented not only for the purpose of sea-bathing, but on account of its two mineral springs; which have lately been analysed by Richard Phillips, Esq. F.R.S. We subjoin the result of his analysis of a gallon of water from each spring.

	North Spring.	South Spring.
Azotic gas	6.3 cubic inches	7.5 cubic inches
Chloride of sodium (common salt)	26.64 grains	29.63 grains
Crystallized sulphate of magnesia	142.68 —	225.33 —
Crystallized sulphate of lime	3104.00 —	110.78 —
Bicarbonate of lime	48.26 —	47.50 —
Bicarbonate of protoxide of iron	1.81 —	1.81 —
Total contents	333.12 —	415.55 —
Specific gravity of the water	1.0055	1.0015
Temperature 19° with very little variation.		

It is probable that the spas may, from the growing reputation of the town, and their being so conveniently connected with it by the bridge above alluded to, again acquire some portion of that celebrity which they formerly enjoyed. The recent erection of a commodious saloon, in the castellated style, with embattled towers, the architectural beauty of the wells, the massive seawall, forming at once a secure protection to the spas and a delightful promenade, especially at high water, combined with the newly laid out ornamental walks and grounds, have materially increased the natural attractions of Scarborough as a watering-place. These improvements have been effected at an expense of upwards of 8,000*l*.

Scarborough, which received its first charter from Henry II., in 1252, is divided under the Mann. Reform Act into 2 wards, the government being vested in a mayor, 5 aldermen, and 18 councillors. Corp. revenue, in 1839, 3,990*l*. Quarter sessions are held under a recorder, and petty sessions are held weekly both for the bor. and North Riding. The bor. has sent 2 mems. to the H. of C. since 23 Edw. I. the right of election down to the Reform Act being in the common council of the bor., a body comprising 41 individuals. The Boundary Act included with the old bor. the extra-parochial precinct of the castle. Registered electors in 1841-42, 539. It is one of the polling-places at elections for the N. riding, and the chief town of a poor-law union comprising 33 parcs. Markets on Thursday and Saturday; cattle fairs, Holy Thursday, and Nov. 23.

N. of Scarborough, on a bold, craggy eminence commanding a very extensive sea-view, stand the ruins of a castle built in the reign of Stephen, to which Piers de Gaveston, the minion of Edward II., fled for refuge from the vengeance of the exasperated barons. The castle, after sustaining two sieges from the parliamentary troops, was dismantled at the close of the civil wars; and though a portion of it was repaired in 1745, and barracks have been subsequently built in its immediate vicinity, it is principally in ruins. The remains of the keep consist of a square tower nearly 100 ft. in height; the entire surface included within the outer walls comprises nearly 49 acres. A strong gateway still remains, with portions of the circular towers occurring at intervals in the line of the fortifications. It was, in fact, previously to the invention of artillery, one of the principal strongholds in the kingdom. (*Haines's Gaz. of Yorkshire; Granville's Spas; Parl. and Mun. Bound. Reports; and Private Information.*)

SCHAFFHAUSEN, the most N. canton of Switzerland; and, after Zug and Geneva, the smallest in the Confederation. It is between lat. 47° 40' and 47° 50' N., and long. 8° 25' and 8° 55' E., being separated by the Rhine from the cantons of Zurich and Thurgau, while, on all other sides, it is surrounded by the territory of the Gd. Duchy of Baden. Area, 116 sq. m. Pop., in 1837, 31,125. Surface undulating, its loftiest hill, the Randenberg, in the N., rising only to about 1,260 ft. above the Rhine. The soil is generally calcareous, but fertile; and the climate is among the mildest in Switzerland. \* It is an agricultural rather than a manufacturing canton; and, according to Picot (*Statist.* 363.), its agriculture has greatly improved within the last half century. Formerly, indeed, the supply of corn was quite insufficient for home consumption; whereas, in good seasons, considerable quantities are now exported. Artificial pastures have also been

materially increased, as well as the number of cattle; fruits are abundant, particularly cherries, from which a good deal of *kirschwasser* is made; and the produce of timber is amply sufficient for the wants of the inhabs. (*Picot.*) There are nearly 8,000 arpents of vineyards, which furnish the principal article of export, wine being sent to St. Gall and Appenzell, the Black Forest, and other neighbouring districts; but of late years the competition of the wines of Baden, &c., and the duties imposed on the Schaffhausen wines in Germany, have crippled the trade.

One of the principal branches of industry in Schaffhausen is the conveyance of goods through the canton, which is greatly facilitated by the navigation of the Rhine. Salt, from Wirtemberg, timber, &c. are conveyed through Schaffhausen to Switzerland; but the circumstance of the Confederation not being comprised within the Prussian Customs Union is injurious to the transit and export trade of the canton; and in consequence a desire to join the German League has long prevailed in Schaffhausen and some other cantons, though not in the majority. (*Bourging's Rep. on Switzerland.*) The manufacturing establishments comprise a few cotton and hardware factories. Accounts are kept in florins, of 60 *Lyenters* = 20*d*. Eng. The foot is the same as that in Zurich; the lb. a little larger.

This canton is divided into 24 districts. The male inhabitants, of full age, and not bankrupts, paupers, or suffering a penal sentence, choose the legislative body. The latter, or grand council, consists of 74 members, 21 of whom form also the petty council, which is intrusted with most part of the executive power. The grand council meets in June every year, and is presided over by a burgomaster, who is changed annually. The pop. is wholly Protestant. Education appears to be well attended to.

Schaffhausen was not included in ancient Helvetia, and its inhabs. resemble their Scaldian neighbours rather than the Swiss. It was admitted into the Confed. in 1501.

SCHIFFHAUSEN (originally *Schiffhansen*, or *Shiphansen*), a town of Switzerland, and the cap. of the above canton, on the Rhine, 25 m. W. by N. Constance, and 49 m. E. N.E. Basle. Pop. about 7,500. It is walled, and defended by the *Munoth*, an old citadel supposed to be of Roman origin, but which is now furnished with extensive bomb-proof casemates. Streets ill paved; and the buildings are remarkable for their quaint and antique architecture: many are ornamented in front with stucco, carved or fresco work. The *minster*, founded in 1052, is a massive edifice in the round arched style, with numerous monuments in its cloisters. An ordinary bridge across the Rhine replaces that unique specimen of art consisting of one arch 364 ft. in length, destroyed by the French under Marshal Oudinot in 1795. Schaffhausen has a gymnasium, a college with 9 professors, a high female school, and an excellent library. The latter comprises the books that belonged to the celebrated historian Müller, by far the most illustrious of the natives of Schaffhausen, where he first saw the light, on the 3d of January, 1752. The town is a principal *dépôt* for the goods passing between Switzerland and Germany, and Basle and Zurich; consisting of silk, cotton, and woollen goods, raw cotton, colonial produce, Nuremberg manufactures, Swiss cheeses, &c. Schaffhausen is supposed to have originated about the 8th or 9th century; it was subjected by Austria in 1330, but has been independent since 1415.

The celebrated Falls of Schaffhausen are situated about a league S.W. from the town, where the Rhine breaks through a ramification of the Black-Forest mountains. The height of these Falls, which, in some respects are the grandest in Europe, varies, according to the season, from 50 to 75 ft., being greatest in June and July, when the river is swollen by the melting of the snow on the mountains. The stream, which, immediately above the fall, is about 300 ft. in width, precipitates itself over a ledge of limestone; four rocks projecting from which divide it in its descent into five portions. The greatest body of water falls between the first of these rocks and the castle of Laufen, on the S.E. bank of the river; from which, according to Murray, the best view of the Falls is obtained. "It is not," says Mr. Spencer, "the height of the fall, but the immense body of water broken into spray in the most picturesque manner over the rocks, that constitutes the great beauty of the cataract. In other respects, it cannot bear the slightest comparison with either those of Terni or the Staubbach." (*Germany and the Germans*, ii. 61.)

In 1790, Lord Montagu, a young British nobleman of great promise, was drowned in a rash attempt to descend these Falls; and, by a curious coincidence, his death occurred nearly at the same time that his noble seat, Cowdrey House, near Midhurst, was burnt down. (*Ebel, Manuel du Voyageur; Picot, Statistique; Bourging, &c. on Switzerland, &c.*)

SCHAUMBURG-LIPPE (PRINCIPALITY OF),

one of the minor states of N.W. Germany, principally between lat.  $52^{\circ} 10'$  and  $52^{\circ} 30'$  N., and about long.  $9^{\circ} 15'$ , surrounded by the territories of Hesse-Schaumburg, Hanover, and Prussian Westphalia, exclusive of some detached lordships enclosed in the territory of Lippe-Deimold. Area, 217 sq. m. Pop., in 1858, 27,600, mostly Lutherans. It lies towards its S. extremity, but flat in the N., where the lake called the Steinhuder Meer occupies about 11,000 morgen. The productive portion of the surface comprises about 74,000 morgen, besides nearly 34,000 m. of forest-land, chiefly in the W. The soil is in general superior to that of Lippe-Deimold, and agriculture and cattle-breeding are more advanced. The inhabs. of both principalities employ their intervals from rural labour in spinning flax and weaving linens. Coal is raised in the S. to the value of about 30,000 dollars a year; and forms, with corn, wool, timber, and linen goods, a principal article of export. The constitution, which dates from 1816, is a limited monarchy; the powers of the prince being similar to those of the sovereign of Great Britain; the *Landtag*, or parliament, consisting of all the landed proprietors, with 4 deputies for towns, and 6 representatives of the peasantry. Appeal lies from the decisions of the courts of this principality to the superior court of Wolfenbittel. Public instruction, as in Lippe-Deimold, is well attended to. Public revenue, about 137,000 dollars. There is no public debt. Schaumburg-Lippe has one vote in the full diet of the Germ. Confed., and with Lippe-Deimold, Hohenzollern, Reuss, Waldeck, and Liechtenstein the 16th place, with one vote in the committee. Its contingent to the army of the Confed. amounts to 240 men. (*Ergebnis*, &c.)

SCHELDT (Fr. *Escaut*), a river of France and Belgium, which rises in the dep. Aisne, near St. Quentin, and runs mostly in a N.N.E. direction, through the dep. du Nord, and the prov. of Hainaut, E. Flanders, &c., to Antwerp, after which it turns S.N.W., and, dividing into the E. and W. Scheldt, which enclose the islands of Beveland and Walcheren, enters the North Sea in about the same lat. as the Thames. Its entire length is estimated at about 200 m., its breadth at Dendermond is about 650 ft., at Antwerp, 1,700 ft.; and the width of its mouth varies from 2½ to 3½ leagues. It is navigable from Valenciennes. Its principal tributaries are the Scarpe, Eys, and Durme, on its W., and the Dender and Rupel on its E. side. St. Quentin, Cambrai, Valenciennes, Tournay, Oudonarde, Ghent and Antwerp, are on its banks. Its current is slow; and in the lower part of its course, where it runs through a completely flat country, its banks are fenced by dykes to prevent inundation. It is connected by the canal of St. Quentin and other canals with the Somme, Seine, and Loire, and with the principal rivers and cities of Belgium, in its neighbourhood. During the commercial ascendancy of Antwerp the Scheldt enjoyed a larger share of traffic than any other European river; but its importance in this respect, though still considerable, has since greatly declined. "There was nothing," says Barrow, "on this noble river, in our progress upwards, that conveyed any impression of an active or extensive commerce. In sailing up or down the Thames, or on approaching London within 4 or 5 m., the multitude of shipping affords indications not to be mistaken of the commercial wealth and prosperity of London. But the Scheldt, when we ascended it, was a vacant river, we neither met nor overtook a single sail; and, with the exception of 2 or 3 American ships, some 10 or 12 small vessels, mostly brigs, there was little appearance of trade along the common quay of Antwerp." (*Tour in Holland*, p. 11.) This, however, was before the revolution of 1830 had made Antwerp once more the commercial emporium of Belgium; and in the interval, the Scheldt has certainly regained some portion of its former commercial station. (See ANTWERP.)

SCHILLESTADT, a fortified town of France, dep. Bas-Rhin, cap. arrond., on the Ill, a tributary of the Rhine, 26 m. S.S.W. Strasburg. Pop., in 1856, ex. com., 9,353. It was fortified by Vauban, and is naturally strong from its being in a great measure surrounded by marshes. It has an hospital, prison, communal college, theatre, manufactures of cotton and linen fabrics, iron wire, soap, and earthenware, for which last it was famous as long ago as the 13th century, with breweries, distilleries, &c. It is supposed to have been the ancient *Et-sabins*, destroyed by Attila, where Charlemagne and his successors had afterwards a palace. The Swedes took it in 1632, but restored it to the French two years afterwards. (*Hugo*, art. *Bas-Rhin*; *Dict. Gog.*)

SCHENMUTZ (Hun. *Selmecz-Banya*), a famous mining town of Hungary, co. Honth, in a mountainous distr., on the Schemnitz, a tributary of the Gran, 16 m. N. by E. Gran. Pop. in 1837, with its suburbs, 17,028. The town is entered by an old and strong gateway, which conduits to a long, narrow, steep street, wretchedly paved, and so hemmed in by sloping hills that there is scarcely room for a row of houses on either side. At the end of this street is a mountain amphitheatre, the

*proscenium* of which is occupied by the churches and other large buildings; while the hill sides are covered with the white cottages of the miners embosomed among trees. (*Paget's Hungary*, i. 327.) The town has many good-looking houses, with shops and inns; but its fine old ruined castle appears to be the only edifice of much interest.

The mines of Schemnitz, which extend under the town, and have been wrought for several centuries, furnish considerable quantities of silver, whence gold is again extracted. The ores vary greatly in productiveness; but, speaking generally, the mines have not been very profitable. There are 6 principal veins or courses, each from 10 to 20 fathoms in thickness, running nearly E. and W. almost parallel to, and at the distance of from 60 to 300 or 400 fathoms from, each other, and connected by various small branches. In these extensive courses there are 12 royal mines, besides a number belonging to private individuals, who are obliged to dispose of all the ore they obtain to the royal smelting works at a fixed rate.

The whole of these mines communicate with the emperor Francis's adit or level, at the depth of nearly 200 fathoms. (*Bright's Travels*, p. 149.) At a still greater depth is the adit of Joseph II., a magnificent work, 12 mining ft. in height by 10 ft. in breadth, extending from Schemnitz to the valley of the Gran, a distance of nearly 10 Eng. m. This adit, which is still unfinished, will carry off the water from mines which cannot now be wrought, and is so constructed that it may be used either as a canal or a railway. It has been already no fewer than 40 years in progress, and it is supposed that, when complete, it will have cost, at least, 100,000. Dr. Clarke, who descended into the mines of Schemnitz, says, "All the Imperial mines are connected with each other; offering, in their whole extent, a subterraneous passage which reaches to the astonishing length of 3,000 fathoms, nearly 3½ m. The sight of the interior of the Pagersstoln (one of the mines) convinced us that there are no mines in the world like those of Hungary. How wretched, in comparison, appear the mines of Cornwall and Wales, where it is sometimes necessary to creep upon the hands and knees, wet through, over all sorts of rubble, to get from one shaft to another. The inside of a Hungarian mine may be compared to the interior arrangement of one of our best frigates, where space has been so husbanded, and cleanliness so strictly maintained, that nothing is seen out of its place, and there is room enough for every operation." (*Travels*, viii. 393, seq. ed.)

Dr. Clarke should, however, have traced that the mines of Cornwall and Wales are wrought by private individuals for the sake of profit only, whereas the Imperial mines which he visited are wrought at the expense of government, to which profit is a secondary consideration. Hence the greater outlay on the latter; hence, also, in part, at least, their comparative unproductiveness, and the bad and costly manner in which, according to Mr. Paget, all the Austrian mining establishments are conducted.

The ore, besides silver and gold, contains lead, and sometimes iron, copper, zinc, or arsenic. In consequence of the want of wood and water but little ore is smelted on the spot, being principally sent to Neusoll or Kremnitz. About 20,000 miners are employed in the Schemnitz district.

Mr. Paget states that the officers and workmen are all very indifferently paid; and hence there is not infrequently a good deal of embezzlement. The workmen, who are paid by the piece, are not permitted to earn more than about 3s. a week: it would seem, indeed, rather to be the object of the government to keep up the mines for the employment they afford, than for the inconsiderable profit made by them.

A school of mining, in imitation of that at Freiberg, was established at Schemnitz in 1760, which has 5 professors and about 200 students, who are all educated free of cost, several of them being further furnished with an annual donation of from 20*l.* to 30*l.* to assist in their maintenance. It is believed, however, that this school is, in respect of science and practical knowledge, far behind that of Freiberg, and most other mining schools. It has a pretty good library, but its collection of minerals is very inferior. (*Paget's Travels in Hungary*, i.)

SCHENECTADY, a town or city of the U. States, New York, cap. co. of its own name, on the Mohawk, a tributary of the Hudson, and on the Erie canal, 16 m. N.W. Albany, with which it is connected by a railway. Pop. in 1840, 6,784. The compact portion of the city consists of about 20 streets, with a court-house, co-offices, prison, about 9 or 10 churches, several banks, iron and brass foundries, carpet and tobacco factories, a paper-mill, and various superior public schools, the chief of which is Union College. This establishment, founded in 1784, and incorporated in 1791, is now one of the principal institutions for public instruction in the state. It has 12 professors and other instructors, and a library of

13,000 vols. (*Amer. Almanack*), and had, in 1835, 241 students. Its position on the Erie canal makes Schiedam an important *entrepôt*, and it has a flourishing and increasing trade. It is said to occupy the site of an ancient Mohawk village, and was incorporated in 1798. (*New York Gaz.*)

**SCHIEDAM**, a town and port of S. Holland, cap. cant., on the Schie, tributary of the Maas, 3 m. W. Rotterdam, and 1 m. N. from the Maas. Pop., in 1837, 11,815. It is well built in the usual style of Dutch towns, and has numerous churches, an exchange, a Latin school, a chamber of commerce and manufactures, and a branch of the Society of Public Good. "It is conspicuous both by the smoke which issues from the chimneys of its distilleries and the vast number of windmills by which it is environed. The whole horizon, in fact, in the direction of Schiedam, seems animated with life and bustle. Schiedam is the chief seat of the manufacture of Dutch gin, or Hollands. The quantity of that spirit produced here annually is very great, there being in the town as many as 100 distilleries, while many thousands of pigs are supported by the refuse of the malt employed in the manufacture. The gin of Schiedam is strong, but mild in flavour, and is usually sold in Holland for *9d.* a bottle, or *4s. 6d.* a gallon; the price of the gallon on its importation into England being increased by freight and duties to about *28s.* or *30s.*" (*Chambers's Tour to Holland*, i.) The duty on Hollands, amounting to *22s. 6d.* a gall., is, in fact, one of the most objectionable in our tariff. The entries of Hollands for home consumption, which formerly amounted to about 200,000 galls., were reduced, in 1810, to 15,592 galls. I doubt, however, whether the consumption be really diminished. The exorbitance of the duty has not taken away the taste for Hollands, but it has thrown the trade into the hands of the smuggler, to the injury alike of the legitimate trader and the revenue. Schiedam has rope-walks, building-docks, and a small though convenient port on the Schie. It sends 1 deputy to the states of the prov.

**SCHWABACH**, a town of Bavaria, c. cap. Middle-Franconia, 9 m. S.S.W. Nuremberg. Pop. 7,600. (*Berghauss*.) It is walled, and pretty well built, having several Protestant churches, a synagogue, a mint, hospital, &c. It is the seat of various manufactures, the principal being that of silk; but there are others of hosiery, hats, gold and silver lace, tobacco, paper, printing types, and Jews' harps. It owes its distinction as a manufacturing town to the influx of emigrants from France, after the revocation of the edict of Nantes.

**SCHWARTZBURG-RUDOLSTADT**, a principality of Central Germany, between lat.  $50^{\circ}30'$  and  $51^{\circ}$  N., and about 11 W. long., inclosed by the territories of Saxe-Weimar, Cobourg, Meiningen, and Hildburghausen. Area 405 sq. m. Pop., in 1837, 65,600, mostly Lutherans. It comprises a portion of the N. declivity of the Thuringian Forest mountains, and is watered by the Schwartz, Ilm, and Saale. It does not yield sufficient corn for home consumption: timber and salt are its principal products. Iron, and a few other metals, are found; and woollen clothes, earthenware, glass, and other kinds of goods are manufactured. Since 1816, the government has been a limited monarchy; the representative body consisting of 5 deputies of the nobility, 5 of the citizens, and 5 of the rural pop. (*Berghauss*; but *Horschmann* says there are 6 of each.) The deputies are elected every 6 years. The parliament has the control of the public funds, and no new law can be adopted without its consent. The principal judicial courts are at Rudolstadt and Frankenhausen; from which appeal lies to the superior tribunal of Zerbst, in Anhalt-Dessau. Public revenue about 208,000 dollars. The public debt has been in rapid process of diminution since 1821, and in 1836 it amounted to only 80,152 dollars. This principality furnishes 539 men to the army of the German confederation. Chief towns, Rudolstadt the cap. on the Saale, with 4,500 inhabs.; and Frankenhausen with 5,000 inhabs.; and a considerable trade in corn and wool.

**SCHWARTZBURG-SONDERSHAUSEN**, a principality of central Germany, between lat.  $51^{\circ}12'$  and  $51^{\circ}26'$  N., and about long.  $11^{\circ}19'$  E., inclosed by territories belonging to Prussia on every side except the W., where it joins a detached district of Saxe-Gotha. Area, 358 sq. m. Pop., in 1834, 54,080, mostly Lutherans. Surface undulating, and traversed by several affluents of the Unstrut, flowing in a W. direction. The lower part of the country yields more corn than is required for home consumption; the higher portion has extensive forests, and timber and potash are amongst its principal products. Iron is found; and forges and hardware factories are the principal manufacturing establishments, though some woollen and linen goods are woven. The government is an unlimited monarchy. Appeal may be made from the judicial courts to the superior court of Zerbst in Anhalt-Dessau. Public revenue, in 1838, 99,536 dollars; expenditure, 94,411 ditto. Public debt, about 79,000 ditto. Contingent to the army of the Confed., 4-1 men. Chief towns, Sonderhausen, the cap., on the

Wipper, with 3,800 inhabitants; and Arnstadt (which see).

This princip., like the preceding, has one vote in the full diet of the Germ. Confed., and shares the 15th place and one vote in the committee with Oldenburg, and the Anhalt principalities. (*Berghauss* &c.)

**SCHWEIDNITZ**, a town of Prussian Silesia, cap. circ. finely situated at the Riesengebirge mountains, on the Weistritz, in a fertile and beautiful country, 30 m. S.E. Breslau. Pop. about 9,500. It is well built; and strongly fortified, the fortifications which had been dismantled by order of Napoleon in 1807, having been re-constructed since the peace on an improved plan, and rendered more formidable than ever. Its castle, formerly the residence of the Piast dukes, is now a workhouse. It has a magnificent Rom. Cath. church, a fine town-house, a gymnasium, a house of correction, and the usual government offices of the cap. of a circ.; with manufactures of woollens, cottons, linens, &c. Near it is the castle of Fürstenstein, a fine antique feudal edifice, bought by the late king of Prussia.

**SCHWEIN. See MECKLENBURG SCHWEIN.**

**SCHWYTZ**, or **SCHWETZ** (CANTON OF), one of the 4 Forest Cantons of Switzerland, which gave its name to the Confederation, in the central part of which it lies, between lat.  $46^{\circ}50'$  and  $47^{\circ}20'$  N., and long.  $8^{\circ}30'$  and  $9^{\circ}$  E., having N. and N.E. the canton of Zurich and St. Gall, E. Glarus, S. Uri and Unterwalden, and W. Zug and Lucerne. Area, 338.3 sq. m. Pop., in 1837, 40,650. Nearly the whole surface is mountainous: the Rosstock rises about 8,200 ft., and the Righi about 6,150 ft. above the sea. (*Bruguiere, Orographie*.) The Rossberg, the fall of a portion of which in 1806 had most disastrous effects, is partly in this canton and partly in that of Zug. The Sihl and the Muota are the principal rivers: the former falls into the Lake of Zurich, which forms most part of the N. boundary of the canton, and the latter into the Lake of Lucerne, which limits the canton to the S.W. The Linth canal, between the lakes of Wallenstadt and Zurich, runs along its N.E. extremity. The soil and climate are more favourable to cattle-breeding than to agriculture, which is so much neglected, that in some valleys, according to Picot, the plough and flail are unknown! On the other hand, however, the inhabs. are distinguished by their superior treatment of live stock; the cattle of Schwytz are accounted among the best in Switzerland; and upwards of 20,000 head are annually sent from the S. side of the Alps to depasture on the mountains during summer. Near Küssnacht, on the Lake of Lucerne, the vine is grown; and apples, which produce cider, are tolerably abundant. The forests are extensive, and the supply of turf is all but inexhaustible; cotton thread, and this in very small quantity, is almost the only article of manufacture. The principal exports are cattle, cheese (sent mostly across Mt. St. Gothard), and timber. The transit trade is of little importance; and on account of the badness of the roads, is mostly confined to the lakes and the navigable parts of the rivers.

The government is a pure democracy, the sovereign power residing in the people at large. The male pop. above 16 years of age form the General Assembly of the canton, which meets every 2 years, on the first Monday in May, at Schwytz, to appoint, by a show of hands, the landammann, and other supreme officers, the deputies to the Diet; and to deliberate on alliances, declarations of war, treaties of peace, &c. A council of high functionaries and 270 ordinary mems., assemblies usually twice a year, to prepare instructions for the deputies, and hear their reports; and another council of 90 mems. is entrusted with the general executive power. The canton is divided into 6 districts, each of which has its own council and tribunal of primary jurisdiction, the decisions of which are final in cases not above the amount of 200 florins. The chief tribunal sits in Schwytz, and is composed of mems., two thirds of whom belong to the districts of the cap., and the rest to the other districts of the canton. The inhabs. are exclusively R. Catholics, subordinate to the bishop of Chur. Public education is more backward in this than in most other cantons; and it has no public library. At 16, every male inhab. is enrolled in the militia, and Schwytz furnishes a contingent of 602 men to the army of the Confederation, in which it holds the fourth place immediately after the three directoral cantons. Schwytz, the cap. of the canton, at the foot of Mount Mythen, 26 m. S.S.E. Zurich, has about 3,500 inhabs. (*Picot, Statistique de la Suisse; Ebel, Manuel, &c.; Inglis's Switzerland*, passim.)

**SCIACCA**, (an. *Therma Scintinae*), a town and seaport of Sicily, intend. Girgenti, on the S. coast, nearly 20 m. S.E. the ruins of Selinuntum, and 30 m. N.W. Girgenti. Pop., in 1831, 12,668. The town, situated on the declivity of an eminence rising from the bay, is surrounded by an irregular wall, in tolerable repair, with bastions towards the sea, and the castle of Luna at  $48^{\circ}$  E. angle. At a distance it has a respectable appearance; but, notwithstanding its large churches, convents, and magazines, it appears to be poverty-stricken and

wretched. Smyth says, that it has not recovered from the influence of the long-continued and deadly feuds between the families of Luna and Perollo, in the 16th century. (*Swinburne's Travels*, ii. 249, &c.)

Some of the famous hot springs, whence the city had its ancient name, are a little without the walls towards the E. But the steam-baths, the construction of which was ascribed, in antiquity, to Daedalus, and now called the Stufe of St. Calogero, are on the summit of an isolated mountain, about 3 m. N.E. of the town, and correspond exactly with the description of Diodorus Siculus. They continue, as of old, to be frequented by patients, and consist of several sudorific grottoes, or caverns, the outer one of which has seats excavated in the rock. (*Hoare's Classical Tour*, ii. 86; *Smyth's Scilly*, p. 218.)

Sciaeca is one of the principal ports on the S. coast of the island, for the exportation of corn, and the rock upon which the town stands is, in numerous places, hollowed out into *cuniculi*, or corn cellars. In summer ships anchor at about 1 m. off town, in from 7 to 12 fathoms, on a bottom of sand and clay; but being exposed to every wind from the S.E. round to the W., it is not resorted to in winter, except by boats and flat-bottomed craft. (*Smyth's Appendix*.)

Agathocles, tyrant of Syracuse, famous alike for his great talents, perfidy, and cruelty, was a native of Sciaeca, where he was born anno 350 B.C. He was of low origin, his father being a potter banished from Reggio, his native city. (*Biographie Universelle*.) Fazzelli, the historian of Sicily, was also a native of this town.

SCILLY ISLANDS, a group of islands, belonging to England, lying about 100 m. W. by S. from the Land's End, supposed to be some of the *Cassiterides*, or tin islands of the ancients. There are supposed to be, in all, about 150 islands and rocks, but there are only about half a dozen of any importance. St. Mary's, the largest, is said to contain about 1,510 acres; the entire area of the group, as given in the population returns, is only 5,570 acres. In 1831, they had a pop. of 2,365. From their situation they necessarily have a mild equable temperature; and though fogs be common, the islands are very healthy. They produce good barley, rye, and oats, the latter being principally of the variety called *pillar*, or *avena nuda*. Potatoes are extensively cultivated. Horses and cattle small; sheep numerous, and of good quality; swine and a few in great numbers, and partridges are, also, abundant. There are shrubs, but few or no trees. The inhabitants used to make great quantities of kelp; they are also expert fishers, and act as pilots to such ships as require their services. As already stated, the islands are generally supposed to be the *Cassiterides*, or tin islands of the ancients. But it is most probable that the W. extremity of Cornwall was included under this term; and, at all events, there is now no trace of tin, nor, indeed, of mines of any sort, in any of the islands. Heng-town, the capital of the islands, and their only town, is situated on the W. side of St. Mary's. It has a pier and a custom-house, and is a place of some consequence, being defended by a fort, called the Star Castle, and a small garrison.

Persons accused of felonies are sent to Cornwall to be tried at the co. assizes; but all minor offences and civil suits are tried by a court consisting of twelve of the principal inhabitants, delegated by the proprietor of the islands under the duchy of Cornwall, of which they form a part. This court sits once a month at Heng-town, St. Mary's, for the trial of cases. Vacancies in it are usually filled up by election; but it may be dissolved and a fresh appointment made by the proprietor.

The position of the Scilly Islands renders them of very considerable importance in navigation. Lying at the point of junction, as it were, of the English and St. George's Channels, ships passing from the one to the other, should be on the main line of traffic, often take shelter under these islands; it is sometimes, also, convenient for vessels to take shelter among them, rather than beat about at sea in bad weather; and a strong gale from the E. usually brings in numerous vessels. There are four principal sounds or roads among the islands, exclusive of smaller inlets. Of the roads, St. Mary's, between the islands of St. Mary and St. Agnes, is the best; but it is generally the safest plan in entering it, or any of the other roads, to make use of pilots. The latter are always in readiness to offer their services.

A lighthouse of the first class was erected on St. Agnes island, the most southerly of the group, in 1680, the lantern of which is elevated 138 ft. above high water mark. It is, according to the ordnance survey, in lat.  $49^{\circ}53'38''$  N., long.  $6^{\circ}19'23''$  W.

But, notwithstanding the warning given by this light these islands have been the scene of numerous shipwrecks. The most distressing of these catastrophes took place on the night of the 22d of Oct. 1707, when the fleet from the Mediterranean, under the gallant Sir Cloudesley Shovel, got foul of the islands; the ship bearing the flag of the admiral and two other line-of-battle

ships struck upon the rocks near the lighthouse, and were totally lost, with every soul on board. Some of the other ships were in extreme danger. It is not exactly known how the accident arose. The night was dark, but there was very little wind, otherwise the whole fleet must have been destroyed. It is probable that the light had been mistaken for another. The body of the admiral was cast ashore, and buried in St. Mary's; but it was soon after removed to Westminster Abbey, where a monument, creditable to the liberality, though not to the art of the nation, was erected to his memory. (See *Borlase's Account of the Scilly Islands*, 4to., Oxford, 1756; *Cornwall*, in *Lyson's Magna Britannia*; *Burnet's Hist. of His Own Times*, iv. 205, ed. 1753; *Smollett's England*, anno 1707, &c.)

SCIO (an. Chios), a celebrated and beautiful island of the Ægean Sea, belonging to the Turks, about 5 m. W. from Cape Bianco, in Asia Minor; Chio, its chief town, on its E. side, 63 m. W. Smyrna, being by lat.  $38^{\circ}22'30''$  N., long.  $26^{\circ}9' E.$  It is about 32 m. in length N. and S., and, where broadest, about 18 m. across. Though for the most part mountainous and rugged, it has a considerable extent of level and gently sloping ground. Its climate is mild and delightful; and it has numerous fine springs and rivulets. Dr. Clarke says it is the "paradise of modern Greece; more productive than any other island, and yielding to none in grandeur." (II. 236, Rvo, ed.) In antiquity and in modern times, down to the late dreadful catastrophe, it was cultivated with the greatest care and assiduity. Owing to the limited extent of the arable land, and the greater suitability of the soil for the use of the principal part of the corn required for the use of the inhab., it was always of great brightness, the ports on the Black Sea and other marts. The staple articles of produce are silk, mastic, figs, lemons and oranges, wine, oil, cotton, almonds, &c. Its mineral wealth has been but little explored, but it contains abundance of marble, jasper, and a kind of green earth, resembling verdigrise.

The wines of Chios, especially those produced in the district of *Arresia*, were amongst the most esteemed of any in the ancient world. They have been celebrated by Virgil (*Ecl. v. lin. 72.*); and Horace asks

"Quo Chios prætor cadum  
"Mercurio?"

According to Pliny, Chian wine was served up by Julius Cæsar at his most splendid entertainments; and it is thought worthy of notice, that Horatius left a very large stock of this famous beverage to his heir. (*Ibid. Nat. lib. xiv. cap. 14, 15.*) The wine of the island still preserves some portion of its ancient celebrity; but the produce is scanty, and it is said to be injured by transportation.

Mastic, the method of gathering which is fully described by Tournefort (i. 376.), is the most esteemed of the modern products of the island, being in great request among the Turkish ladies. All the mastic trees are supposed to be the property of the grand seignior, or rather of the sultana mother, of whom this island is the peculiar demesne. But formerly the trees were left, to the island itself, to the inhabitants, with but little interference on the part of the Turks, on condition of their annually furnishing a certain quantity of mastic to the Cadi for the use of the imperial seraglio, and paying a moderate capitation tax. And it is to the comparative exemption it has thus enjoyed from Turkish despotism and rapacity, that the sprightly vivacity of its inhabitants, and their greater industry, enterprise, and prosperity, are to be ascribed. Besides its chief city, the island had, previously to its late calamity, several considerable towns and numerous villages. The pop., which was very dense, has been variously estimated at from 80,000 to 150,000; of whom from 30,000 to 35,000 belonged to the capital.

The harbor, on the east of the island, constructed by the Genoese, along the sea shore at the foot of the mountains (an. *Pellencis Monks*), on the slope of which stood the ancient city, is the cleanest, handsomest, and most desirable town, as a residence, in the Levant. It is well built, and extended, previously to 1822, with its gardens and villas, for about 4 m. along the sea. Its houses are commodious, and its shops and warehouses were then well furnished; it had numerous Greek and R. Catholic churches, with schools, and even a college. The silk manufacture was carried on upon a large scale, and the velvets, damasks, and other silk goods of Scio, were highly esteemed. It had been for many years the principal entrepôt of the Archipelago, and carried on an extensive and flourishing commerce. Sommiu says that the shallowness of its harbour, which was suitable only for the smaller class of vessels, was the only drawback on its prosperity; but this defect was to a great extent compensated by the excellence of its roadstead, which affords secure anchorage, and every facility for getting to sea. (*Tournefort*, i. letter 9.; *Sommiu's Travels in Greece and Turkey*, cap. 37.; *Walpole's Journal*, quoted by Clarke; *Cornu's Letters from the East*, &c.)

Unhappily, however, these statements apply to the

past more than to the present state of this fine island. In 1822, during the progress of the revolutionary struggle in Continental Greece, a Greek force landed in the town, and a part of the inhab., who had hitherto pursued a strict neutrality, having joined them, they attacked and took the citadel, defended by a small Turkish garrison, which they put to the sword. A strong Turkish force having landed immediately after, took the most desperate revenge for the outrage that had been committed. The island was given up to indiscriminate pillage and massacre. The inhab., taken by surprise, and enervated by long peace and prosperity, offered no effectual resistance to their murderous assailants. It is said that above 20,000 individuals were put to the sword; that as many more, principally women and children, were carried off and sold as slaves; and that the capital was converted into a heap of ruins, and every part of the island laid waste! These statements are most probably a good deal exaggerated; but still there cannot be the shadow of a doubt that the visitation was of the most destructive and tremendous description. Whether Scio be ever destined to recover from this wholesale butchery is problematical; but it were absurd to expect that it should revive so long as it remains in the deadly grasp of the detestable barbarians who have perpetrated such atrocities. Such of the principal inhab., as were fortunate enough to escape being massacred, immediately fled from the island; and that commerce which had been its principal support, has been transferred to Syra, Napoli, and other places. (*Cornwall's Letters from the East; Tract on the Greek Revolution*, by the Rev. T. S. Hughes, Lond., 1822; &c.)

In antiquity, Chios gave birth to many distinguished individuals; among whom may be specified Ion, the tragic poet, *Protagoras*, the historian, *Theophrastus*, the sophist, and *Metrodorus*, the physician and philosopher. But Chios aspires to a still higher honour, that of being the native country of the first and greatest of poets.

"The blind old man of Chio's rocky isle,"

of whom *Velleius Paterculus* has justly as well as forcibly said,—"quid neque ante illos, quem illi imitatur; neque post illos, qui cum imitari possent, invenit est." (Lib. i. cap. 5.) And it is admitted by the ablest critics that, of all the cities that contended for the honour of having been the birth-place of Homer, the claims of Chios and Smyrna were apparently the best founded.

The Chians were, for some time, in possession of the empire of the sea. They are said to have been the first

who traded in slaves; and the oracle, informed of the fact, declared that it had drawn upon them the miter of heaven; one, says *Barthelemi*, of the noblest, but at the same time, least regarded answers the Gods have communicated to man. The Chians took a prominent part in the great revolt of the Ionian cities against the Persians, by whom they were afterwards reduced, and punished with great severity. At a subsequent period we sometimes find them on the side of the Athenians, and sometimes on that of the Lacedæmonians.

"Moderate in prosperity, blameless towards their neighbours, and using their increasing wealth and power for no purpose of ambition, but directing their politics merely to secure the happiness they enjoyed," the Chians were amongst the most respectable of the Greek states. (*Mitford*, iii. 316., 8vo. ed.)

They became the allies of Rome during the wars with Mithridates. After innumerable vicissitudes Scio came, in the middle ages, into the possession of the Genoese, who, as already stated, built its capital. It was taken by the Turks in the 16th century. (Exclusive of the authorities referred to above, see *Ancient Universal History*, viii. 296., &c., 8vo. ed.; *Cottar's Geographia Antiqua*, ii. 19.; *Voyage d'Anacharsis*, cap. 72., &c.)

SCOTLAND, one of the secondary European kingdoms, comprising the Northern and smaller portion of the island of Great Britain, and forming one of the three great divisions of the United Kingdom of Great Britain and Ireland, between lat.  $54^{\circ} 38'$  and  $59^{\circ} 40'$  N., and long.  $1^{\circ} 46' 30''$  and  $6^{\circ} 3' 30''$  W., or, including the Hebrides,  $7^{\circ} 42' W.$  It is surrounded by the ocean on all sides, except on the S., where it is separated from England by the Solway Frith, the Cheviot hills, and the Tweed. Its greatest length, N. to S., from Dunnet Head to the Mull of Galloway, may be estimated at about 280 m.; its breadth is very unequal; varying from 32 m., between Allen on the Frith of Forth and Dumbarton on the Clyde, to 146 m. between Buchanness Point in Aberdeenshire and Rowanmoan Point in Ross-shire. Its subdivisions, area, and pop., are as follows:

Counties.	Total Area in sq. m.	Area of Land in Acres.	Area of Lakes &c. in Acres.	Pop. in 1851.	Pop. in 1841.	Acres of Land to an Individual.

\* The various totals of the above counties include 4,715 persons in barracks, and 1,754 persons in vessels, &c. in harbours.

Scotland is extremely irregular in its surface and outline, and, compared with England, may be said to be sterile, rugged, and mountainous. This is so much the case, that, estimating the whole extent of the country, inclusive of islands and lakes, at 19,000,000 acres, perhaps

not more than 6,000,000, or, at most, a third part, are arable; while the surface of England and Wales, amounting to 37,000,000 acres, comprises at least 29,000,000 acres, or more than three fourths, of arable land. With the exception, indeed, of a few rich allu-

val tracts, there are no extensive vales in Scotland; its surface, even where least mountainous, being generally varied with hill and dale. It is divided by the Frith of Clyde, Loch Lomond, and the Grampians, into the two grand divisions of the Highlands and Lowlands; the former comprising the N., and the latter the S. part of the country. The Highlands again are divided into two unequal parts by the remarkable narrow and deep valley through which the Caledonian Canal has been constructed. The arable lands in the Highlands are mostly confined to the E. parts of Ross and Cromarty, a slip along the S. side of the Moray Frith, and the E. parts of Aberdeenshire. With these exceptions, the far greater part of the Highlands consists of mountains, moors, and morasses; and in various parts, especially along the W. coast, they are extremely bleak and barren. In Caithness there is a considerable extent of low ground, but it is mostly moor. The Lowland division of the country comprises, also, a large extent of mountain tracts; but the mountains are not so lofty nor so bleak and rugged as in the Highlands, and there is a much greater extent of low fertile land.

The mountains of Scotland run generally in chains from S.W. to N.E., though there are many detached groups not following this distribution. They are frequently rocky, bare, and precipitous; though mostly covered with heath. The principal and most celebrated chain is that of the Grampians, which comprises nearly all the highest of the Scottish mountains, except Ben Nevis. This stony girdle extends across the island from the arms of the sea, called Loch Etive and Loch Fyne, in Argyleshire, E. by N. to Stonehaven on the E. coast, and Echt in Aberdeenshire, forming, as already stated, in the greater part of its course, the line of demarcation between the Highlands and Lowlands, and separating the waters which flow into the Forth, Tay, and South Esk, from those which join the Spey, Spey, and Dee. Its most elevated summits are near the head of the Northern Dee. Ben Macduin, 11 m. N.W. Braemar, lat.  $57^{\circ} 6'$  N., long.  $3^{\circ} 37'$  W., 4,290 ft. above the level of the sea, is at once the culminating point of the Grampians, and the highest of the British mountains, being 20 ft. higher than Ben Nevis, which was long considered as the highest of the Scotch mountains, and 819 ft. higher than Snowdon, in Wales. The other principal summits in the Grampian chain are Cairnoul, 4,245 ft.; Cairngorm, 4,095 ft.; Ben Lawers, 3,945 ft.; Ben Avon, 3,967 ft. in height, &c. Ben Lomond, in Stirlingshire, 3,195 ft. in height, on the E. side of Loch Lomond, the best known of all the Scottish mountains, also belongs to this chain. The Grampians are distinguished by their sterility, and desolate aspect; their sides in many places exhibiting vast perpendicular ledges of rock. The principal passes through the chain are those of Aberfoyle, Leni, Glenshie, and Killiecrankie.

Ben Nevis, alluded to above, lies to the N.W. of this chain, in about  $56^{\circ} 49'$   $30''$  N. lat., long.  $5^{\circ}$  W., being separated from the Grampians by the moor of Rannoch. It rises to an elevation of 4,370 ft. above the sea. Its summit, which commands a magnificent view extending from the Paps of Jura to Cullin in Skye, Cairngorm, Ben Macduin, &c., is, during the greater part of the year, covered with snow. From Ben Nevis N. to Loch Broom several mountains rise to nearly 4,000 ft. in height; and the country is so thinly inhabited that frequently for many miles not a house is visible. But from Loch Broom to Cape Wrath the surface diminishes considerably in elevation, and, though bleak in the extreme, is, for some distance from the W. coast inland, not more than about 1,000 ft. above the sea.

In the Lowlands, the Sidlaw and Ochil hills, which run parallel to the Grampians, nowhere rise to 2500 ft. Indeed, Broadlaw, on the N. border of Dumfriesshire, the highest mountain in the S. of Scotland, is only 2,741 ft. above the sea. The more elevated tracts in the Lowlands, including the mountains of Roxburgh, Dumfries, Peebles, Selkirk, and Lanark shires, are frequently smooth, and covered with a fine sward, affording good pasture for sheep.

Though the valleys and level tracts in Scotland be few and of limited extent, as compared with those of England, some of them are extremely fertile, and they are mostly well cultivated. The carse of Stirling and Falkirk, on the banks of the Forth; that of Strathern and Gowrie, on the Tay; and the merse of Berwickshire, all low alluvial tracts, are not inferior, in point of productiveness, to any lands in the empire. Teviotdale, or the low lands along the Teviot; Tynedale, or the low lands along the Tyne, in E. Lothian; the How of Fifo, or the low ground along the Eden in Fifeshire; and Strathmore, or the low grounds between the Grampian Mountains and the Ochil Hills, consist for the most part, of rich loamy soil, and are extremely well farmed. It should also be observed that the general inequality of the surface makes the lower parts of the country appear to be much less fruitful than they

really are; the hollows between the small eminences being often extremely fertile, and the eminences themselves, even when they are unsuited to tillage, frequently furnish excellent pasture. This is particularly the case in the S.W. counties: large tracts of land in Galloway and Dumfriesshire that let from 20s. to 30s. an acre and upwards, would appear to one not well acquainted with the country and its capabilities worth little or nothing. A good deal of level but generally high-lying land, especially in the Highlands, and in some parts also of the lowlands, consists of moors; having for the most part a clay subsoil, covered with peat earth or moss impregnated with water, not unlike the bogs of Ireland. Many of these moors are of very considerable extent; the largest, probably, as well as the most desolate and worthless, is the moor of Rannoch, to the S. of Ben Nevis, comprised in the shires of Argyle, Perth, and Inverness.

**Rivers.**—Scotland has numerous rivers, several of which are of considerable size. They differ from those of England in being more precipitous, rapid, and interrupted by cataracts, and subject to sudden overflows. Except the Clyde, the others mostly disembogue on the E. coast. The Tweed, which rises on the confines of Dumfriesshire and Lanarkshire, falls into the N. Sea at Berwick, after a course of about 100 m., only a small portion of which is navigable. Proceeding northwards, the next river of any considerable magnitude is the Forth, which rises on the E. side of Ben Lomond, and has in general an easterly, but very tortuous course to Kincardine, where it unites with its great estuary, or rather arm of the sea, the Frith of Forth, the *Baethra* of Tacitus. It receives, on its S. side, the Forth and Allan, and from the S., the Devon, &c.; Aberfoyle, Stirling, and Alloa are on its banks. The Forth is rapid for some considerable distance from its source; but during the greater part of its course it runs through a flat country with many windings: vessels of 300 tons ascend the Forth as far as Alloa, and those of 70 tons ascend to Stirling. It is connected with the Clyde by the great canal from Grangemouth to Dunglass. The Tay is the largest of Scotch rivers, and is supposed to carry more water to the sea than the Thames, or any other river in Great Britain. (See TAY.) The N. and S. Esks, Dee, Don, Spey, and Findhorn, all discharge themselves on the E. coast; and in the N. division of the Highlands are the Nairn, Ness, Reanly, &c. The Spey is one of the largest rivers in Scotland, and certainly the most rapid. It rises in Loch Spey, and pursues mostly a N.E. course to the Moray Frith, which it enters after a course of about 96 m. It receives no large tributary, but innumerable mountain torrents, in consequence of which it is subject to frequent and destructive inundations. The Clyde, the *Glotta* of Tacitus, though not the largest, is decidedly the most important Scotch river in a commercial point of view, Lanark, Hamilton, and Glasgow being situated on its banks. It rises in the highest part of the Lowlands, close to the sources of the Tweed and Annan; and runs at first N., but afterwards generally N.W., to the Frith of Clyde, with which it unites 7 or 8 m. below Glasgow, after a course of between 70 and 80 m. It receives from the S. the Douglas, Seltoun, Avon, Cart, &c.; and from the N., the Kelvin, Leven, &c. The Clyde has been rendered navigable for vessels of 400 tons, as far as Glasgow. (See CLYDE, AND GLASGOW.) The Southern Dee, Nith, and Annan, flowing into the Solway Frith, are the only other streams it is necessary to notice.

The lochs, or fresh-water lakes of Scotland, are numerous, and highly distinguished for their picturesque scenery. Loch Lomond (which see, *ante*, p. 193.) is the largest lake in Great Britain; being about 21 m. in length, and from 7 m. to 7½ m. across in the broadest part. It is estimated to cover about 25,000 acres. Lochs Awe, Ness, Menteith, Tay, Shin, &c., in the shires of Argyle, Ross, Perth, and Stirlingshire, are among the other principal lakes. Most of these are long, narrow, and deep, filling up the bottoms of the valleys between the mountains. They abound with trout, perch, pike, &c.; but Loch Leven, in Kinross-shire, is the only lake that yields any revenue to its proprietors.

The coasts of Scotland are mostly bold and rocky; and on the W. side, in particular, they are very much indented by arms of the sea, termed friths, and lochs, that extend far inland, and for the most part, carry deep water to their very head. These friths and inlets are of considerable importance in a commercial point of view, especially as few of the rivers are navigable to any great distance inland. On the E. coast are the friths of Forth and Tay, which, especially the first, are of great importance, as affording facilities of communication to the richest districts of the country; N. of the latter, on the same coast, are the friths of Moray, Dornoch, Cromarty, &c.; on the W. coast, the Frith of Clyde, and Lochs Broom, Torridon, Linne, Fyne, &c., deeply indent the country. The harbours of Leith, Grangemouth,

Queensferry, Bruntisland, &c., are in the Frith of Forth, and those of Dundee and Perth in the Frith of Tay. Between the Tay and Buchan Ness are the harbours of Montrose, Aberdeen, and Peterhead: the Frith of Cromarty, N. of Buchan Ness Point, is unquestionably the best asylum for shipping on the E. side of Great Britain, and one of the finest. Indeed, that is anywhere to be met with. Between the latter and Duncansby Head are the small harbours of Wick, St. Clair's Bay, &c. From Cape Wrath to the Clyde, the narrow arms of the sea, though deep and secure, are little frequented. The ports of Greenock and Glasgow are the principal in the Frith of Clyde, and enjoy an extensive trade; but Lamlash Bay, on the E. side of the Isle of Arran, is the best harbour in this neighbourhood. There are some pretty good harbours on the coasts of Wigtown and Kirkcudbright shires. The principal headlands are St. Abb's Head, Fife Ness, Peterhead, Tarbet Ness, and Duncansby Head, on the E.; Dunnet Head and Cape Wrath, on the N.; Ru-Ru, Ardnachurchan, and the Mull of Oe and Cantire, on the W.; and the Mull of Galloway and Burrowhead, on the S. coast.

There are few, or no islands, off the W. coast, but many of large size lie contiguous to and off the W. coast. These are mostly included under the Hebrides (which see). The islands of Orkney and Shetland (which see) lie off the N. coast of Scotland; the Orkneys, the nearest, being separated from the mainland by the Pentland Frith, 6 m. across.

**General Aspect of the Country.**—The finest parts of the low country of Scotland usually want the rich luxuriance of an English landscape. Within the last sixty or seventy years a great deal has, no doubt, been done in the way of raising plantations; and the strictures of Dr. Johnson, as to the deficiency of wood, would at present be quite inapplicable, however just they may have been when dictated. In Scotland, however, plantations are not spread generally over the country, but are mostly congregated in the neighbourhood of gentlemen's seats, while in many large tracts they are wholly wanting. In most parts, too, we look in vain for those hedgerow trees that give so much of a woody appearance to the southern part of the island. Generally, also, the inclosures are a good deal larger than in England; and the fences being either stone walls (dykes) or hedges, that occupy only a small space of ground, having little of the breadth and roughness of those of England, the country, however well farmed, seems to an Englishman deficient in vegetation and verdure, and cold and comfortless. On the other hand, however, the succession of new objects presented by the unevenness of the surface, the rude grandeur of the mountains that every where bound the prospect, and the striking contrast frequently afforded between rich, well cultivated, low grounds, and the contiguous high barren ridges, take from the Scottish landscape the tawiness and monotony that prevail in many parts of England, and render it singularly picturesque and impressive.

**Climate.**—Scotland has a more rigorous climate than England; but owing to the proximity of most parts of the country to the sea, and the numerous bays and deep bays by which it is penetrated, it is less severe than might, from the lat., be expected. The mean annual temperature of places near the level of the ocean, throughout the country, averages about 46° F. At Edinburgh, which is from 30 to 40 ft. above the sea-level, the mean temperature of the year is 47° 5, which may be taken as that of the inland parts generally in the S. of Scotland, the mean of the coldest month being 38° 5, and of the warmest, 59° 5. A great deal of the falls in Scotland, but very unusually, for on the E. coast it ranges from 22 to 28 in.; whereas, on the W. coast and in the Hebrides, it averages from 50 to 44 in. The average fall of rain in London is about 27, and in Glasgow about 29 7 in. The E. coast is, and the occurrence of heavy rains in August, September, and October, and of cold winds from F. which, especially along the E. coast, in the months of April, May, and the first half of June, are the great drawbacks on the climate of Scotland. It is rare, indeed, that the crops suffer from drought; but they frequently suffer from wet and from violent winds, especially in the W. part of the country. The climate is, however, highly salubrious, and favourable alike to longevity, and to the development of the physical and mental powers.

**Geology.**—A line drawn in a N.E. direction from the m. of the Clyde to Stenichaven, on the E. coast, separates the two principal geological regions. The first, to the N. of that line, is mostly composed of primary rocks, granite, gneiss, mica-slate, covered at the foot of the mountain chains with beds of calcareous and red sandstone; whereas the second, to the S. of the above line, is the region of transition formations, in which rocks of that kind mostly prevail, overlain in various parts by trap, red sandstone, and coal beds: granite is, however, largely developed in the S.W. of the kingdom, in the stewartry of Kirkcudbright, at Criffel, and in the Cairnsmuir range. Little if any coal exists in the primary division of the country; few metals are discovered there, and its most important mineral products are building-stone and roofing-slate. Some lead mines are, however, wrought at Strontian, in Argyshire; and in Inverness-shire, plumbago of inferior quality has been found, imbedded between laminae of mica-slate. None of the secondary calcareous formations, so extensively prevalent in England, have been found in Scotland, nor any tertiary formations.

**Coal and Iron.**—The great coal district of Scotland may be considered as bounded on the N. by a line drawn from the mouth of the Tay to the N. extremity of the Isle of Arran, and on the S. by another line drawn from St. Abb's Head to Girvan, in Ayrshire. These limits comprise a band of country, in which are several large coal-fields detached from each other, the most valuable extending along the banks of the Forth, with a breadth of from 10 to 12 m. on either side the river. The Edinburgh coal-field, to the S. and E. of that city, occupies an area of 80 sq. m.; and from Edgiate the coal deposits extend W. to Glasgow and Paisley, and have, in fact, been the principal cause of the wonderful progress made by the former in manufactures, wealth, and population. There are several small detached coal-fields in Ayrshire and some of the other S. counties. Iron is of frequent occurrence in the coal districts, especially in Lanarkshire, where the ores are of the very best quality; and the iron trade of that county, and of Scotland generally, has latterly increased with unexampled rapidity, and is now of the greatest importance. So much so is this the case, that, while in June, 1835, there were only 23 furnaces in blast, estimated to produce 75,000 tons of iron, it appears from the following statement, obtained from private sources, on which every care has been taken, that in July, 1845, there were 87 furnaces in blast, producing at the rate of 441,500 tons a year. There were then also 20 new furnaces in the course of being built, capable, when finished, of furnishing an additional supply of above 100,000 tons a year!

Glenarnock	Ayr	4	2	—	400	20,000
Muirkirk	—	3	—	—	180	9,000
Blair	—	3	—	—	270	15,000
		87	12	9	8,850	441,500

Exclusive of the above, there were in progress, when this return was made up, 8 new furnaces in Ayrshire, 1 do. in Lanarkshire, and 1 do. in Fife-shire.

The whole of the above iron is made by means of heated air, with the exception of one furnace at Cartron.

The weekly quantity is equalled by 50 only, the average stoppages being equal to 3 weeks per annum.

The bar iron trade of Scotland has not made the progress that might, perhaps, have been anticipated. We subjoin some details.

#### Bar Iron Works in Scotland in July, 1845.

Works.	Where situated.	Weekly Product.
Monkland	Lanarkshire	250 tons
Govan	—	200
Dumfries	—	200
Gartsherrie	—	1600
Mossend	—	70
Muirkirk	Ayrshire	80

At 30 cwt. pigs to the ton of bars, 1900 tons per week of bar iron require 1,500 tons per do. of pig iron; leaving 1,000 tons of the latter in Scotland 7,500 tons per week, or 266,500 tons a year.

#### Bar Iron Works in the course of being erected in Scotland, in July, 1845.

Works.	Where situated.	Quantity intended to be made.
West of Scotland malleable iron Works	Lanarkshire	500 tons per Week.
Glasgow malleable iron Works	—	150 tons per Week.

The above two works are expected to be in operation within six months from this date (July, 1845).

Gold has been occasionally found in the streams near the lead hills in Lanarkshire, and elsewhere; and silver has been met with in various places; but the precious metals are not so abundant as to defray the expense of seeking for them.

Next to iron, lead and copper are the most valuable metals. The mines of Wanlockhead and Leadhills, on the borders of Lanarkshire and Dumfriesshire, furnish annually about 1,200 tons of lead, but the produce varies considerably. Small quantities of cobalt, bismuth,

manganese, &c., are met with. Scotland produces marble in great variety, and of very superior quality, slates, excellent building stone, and many species of gems. Brick is but little used in building in Scotland; the houses being every where almost of stone.

Scotland is supposed to possess about 3,230 indigenous plants, of which 870 are dicotyledonous, 280 monocotyledonous, and 2,080 cryptogamic. Most of the forest trees of England are met with. In the Highlands are several extensive forests of pine (*Pinus sylvestris*), covering the valleys, and ascending to an elevation of 2,500 ft. up the mountains. Apples, pears, plums, peaches, apricots, &c. ripen in the open air as far N. as Inverness, and in warm sheltered situations to the N. extremity of the kingdom. The sea-weed, which grows in great profusion round the coasts, used to be extensively manufactured into kelp, and the business, though much diminished, in consequence of the preparation of *soude facie* (artificial soda), is still carried on to a considerable extent.

The wild animals of Scotland are mostly the same as those of England, including the stag, wild roe, hare, rabbit, fox, badger, otter, wild cat, hedge-hog, &c.; though some of these are becoming scarce. The wolf and beaver, formerly natives of the country, have been long extinct; and the only existing remains of the *urus*, or native breed of cattle, are restricted to a few preserved in the Duke of Hamilton's park, near Hamilton. One of the domestic animals peculiar to Scotland is the *colly*, or true shepherd's dog, and many specimens of the unmixed breed are extant. Several species of eagles, and other birds of prey, and aquatic birds in great numbers, inhabit the rugged coasts, and the pheasant, partridge, black-cock, grouse, and partridge, abound inland. The noble species of game called the capercaillie, or cock of the wood (*Tetrao Urogallus*), was formerly abundant in Scotland; but it appears to have been exterminated about 1760. Within these few years, however, it has been re-introduced by the Marquis of Breadalbane, the Earl of Fife, and other extensive forest proprietors; and there can be no doubt that, if properly protected, it will succeed very well; but it is too obvious and too tempting a mark for the poacher to maintain itself. Scotland has also most of the English singing-birds, except the nightingale, which is rarely, indeed, found N. of the Trent. The fish are similar to those of England: the rivers teem with the finest salmon, trout, &c.; and the salmon fisheries of the Tay, Tweed, Forth, Spey, &c., are highly valuable.

**Fisheries.**—The salmon fishery is the most important of what may be called the domestic fisheries; and since 1790 London has received the greater part by far of her supply of salmon from Scotland, considerable quantities being also sent to Liverpool. The fish are brought up, even in the hottest weather, quite fresh, being packed in pounded ice. Previously to the introduction of this plan, salmon used to be consumed principally in the country where it was taken; and, in some parts of Scotland, domestic servants used to stipulate that they should not be obliged to dine on salmon more than three or four times a week. The salmon fisheries seem to have attained their maximum value towards the end of last war, when the

fisheries in the Tweed were let for from 15,000*l.* to 18,000*l.* a year; and those of the Tay, Dee, Spey, &c., were proportionally valuable. But the value of the Scotch salmon fisheries has, speaking generally, declined greatly of late years; in consequence partly and principally of a diminished supply of fish in the rivers, but, in some degree, also, from the greater facility of the communication between London and Liverpool, and the consequent importation of Irish salmon into the London markets. We have been fortunate enough to obtain from a source on which every reliance may be placed, the following

ACCOUNT of the Quantity of Salmon packed in Ice imported into London, from Scotland, during each of the 8 years ending with the 14th of Oct., 1841, and of the wholesale Price of the same.

Years ending Oct. 14.	Weight of Fish.	Average Price, about.	Total Value.
	<i>Lbs.</i>	<i>per lb.</i>	<i>£.</i>
1834	3,432,800	9	135,900
1835	4,710,060	9	177,800
1836	2,751,810	10	120,400
1837	3,617,600	10	130,750
1838	2,396,800	10	104,160
1839	1,830,080	11	83,880
1840	1,697,320	11	77,850
1841	3,192,472	8½	116,100

This, it will be observed, is independent of the pickled salmon brought from Scotland, the quantity and value of which varies as much as that of the fresh salmon. But we are well assured that, at an average of the last eight years, its value has not exceeded 12,000*l.* a year. At an average, the retail price of salmon in London may be taken at from 50 to 75 per cent. above the wholesale price.

We may remark by the way that as by far the largest portion of the salmon made use of in London comes from Scotland, the above statement shews that its consumption in the metropolis is not nearly so great as is generally supposed. In fact, it is little used except by the more opulent classes; and nothing that is not generally used by the middle classes, or by them and the lower, is ever of much importance.

The herring fishery has latterly been prosecuted with considerable success, and is now becoming an important branch of industry. Down to a recent period, it had been attempted to bolster up this department by granting bounties on the fitting out of vessels for the fishery, on the herrings taken and exported, and so forth. But notwithstanding the very large sums expended in this way, their influence was found to be injurious rather than otherwise; partly by the meddling they occasioned on the part of government, and partly by the temptation the bounty afforded to small farmers and others, hitherto acquainted with the business, to engage in it to the injury of the regular fishermen. At length, however, the abolition of the duty on salt, and the growing conviction of the inexpediency of the bounty, led first to its gradual, and ultimately to its total, abolition in 1830; since which, we are happy to have to state, the business has not only been carried on upon a solid foundation, but has progressively increased. This is obvious from the following

ACCOUNT of the total Quantity of Herrings cured, branded, and exported, in the under-mentioned Years.

Years ending April 5.	Total Quantity of Herrings cured.			Total Quantity of Herrings branded.	Total Quantity of Herrings exported.		
	Gutted.	Ungutted.	Total.		Gutted.	Ungutted.	Total.

1843	412,294	181,174	593,468	162,113	287,613	4,757	292,370

N.B.—In the 6 years ending 5th April, 1815, the bounty on herrings cured gutted was 2*s.* per barrel, while there was a bounty at the same time of 2*s.* 8*d.* per barrel, payable by the excise, on the ~~the~~ portion of herrings, whether cured gutted or ungutted, but which ceased on the 1st of June, 1815. In the 11 years ending 5th April, 1826, the bounty on herrings cured gutted was 4*s.* per barrel (about 25 per cent. on the wholesale price). In the 4 succeeding years, the bounty was reduced to 1*s.* per barrel each year, till the 5th April, 1830, when it ceased altogether, and has not since been renewed.

The cod and white-fish fishery is also extensively carried on; about 100,000 cwt. having been cured in the year ending the 5th of April, 1840. The large share taken by Scotland in the Northern whale fishery is evinced by the statement, that, in 1831, of 76 vessels engaged in the trade, 41, of the aggregate burden of 13,242 tons, were from Scotland, and brought home 4,912 tons of oil and 257 tons of whalebone. This department of industry has since, however, rapidly declined, not from any diminution of skill or enterprise, but from the in-

creasing risks and unprofitable nature of the business. Fortunately the loss of the whale fishery has been more than compensated by the extension of the herring fishery, and the success that has attended it.

**Races of Inhabitants.**—It is generally allowed that the first immigrants into Scotland, like those into England, whence, perhaps, they originally came, belonged to the great Celtic family; and Mr. Chalmers and others have endeavoured to prove that the population continued to be purely Celtic till it was alloyed, first by Roman, and

subsequently by Gothic, invaders. (*Caledonia*, vol. i. p. 496, &c.) But this opinion does not seem very tenable. Tacitus expressly affirms that the Caledonians, or inhabitants of Scotland, were of Germanic or Gothic origin. "*Buthie Caledoniam habitantem come, magni artus, Germanicam originem adscriptam*." (*Ep. Agricola*, cap. ii.) Agricola, however, from whom Tacitus derived his information, knew little or next to nothing of the country N. of the Grampians; and, as there is every reason to think that Berwickshire, the Lothians, Fife, and other parts of the low country on the E. coast of Scotland, were, like the same tracts in England, early occupied by Belgic, or other Gothic colonists from the opposite continental coast, it seems most probable that Tacitus, in ascribing to the Caledonians a Germanic origin, had these only in view. The fair presumption is, that, in the northern, as in the more southern part of the island, the old Celtic inhabitants maintained their ascendancy in all the mountainous, and, comparatively, inaccessible districts; and this reasonable presumption is corroborated by various circumstances.

In the third century, the terms Picts and Pietland began to be substituted for Caledonians and Caledonia. It is pretty generally believed that these terms apply to the same people, and the same country. It seems, indeed, to be perfectly clear, that the Picts were descended from the Scythians, or Goths; and, if we be right in our statement, as to the origin of the Caledonians, it follows that, if the Picts were not identical with them, they belonged, at all events, to a congenerous race.

About the period of the withdrawal of the Romans from Britain, a tribe called *Scoti*, or *Atacoti* (the *Dairiads* of the venerable Bede), began to be distinguished as a leading tribe in Ireland; and seems, indeed, to have given its name to the island, which, for some centuries, was called *Scotia*. (*Pinkerton's Geography*, i. 137, ed. 1811.) It would seem, that, previously to the 11th century, a colony of the Scott from Ireland had established themselves in the West Highlands; and this colony, in no very long time, gave its name, first to the Highlands, whence it was subsequently extended, on its being united under one government, to all that part of the island N. of the Tweed and the Solway Frith. The Scott ceased to be heard of in Ireland not long after they had obtained a footing in the Highlands, and the ancient names of that island were revived.

Every thing connected with the history of the Scott is involved in impenebtable obscurity. But it is agreed, that, whatever may have been their remote origin, they had, when they settled in the Western Highlands, the language and habits of the Irish Celts, or Gael, a congenerous race with the Highland Celts, and speaking, in fact, the same language. But the Scott-colonists had a written language, which the old occupiers of the country had not; and they were also decidedly superior to the

latter in knowledge and civilisation. (*Pinkerton, On the Early History of Scotland*, ii. 160.) These circumstances sufficiently account for the ascendancy they acquired, and for their being able to give their name to the Highlands, without having recourse to the hypothesis, for which there is not a title of evidence, of their having conquered the country.

After the Romans withdrew from Britain, some Gothic or Saxon tribes, following the example set by those who had previously settled in the more southerly parts of the island, established themselves, during the sixth century of our era, between the Tweed and the Frith of Forth. (*Turner's Anglo-Saxons*, 5th ed., i. 229.) These new immigrants were afterwards followed by others, at the same time that they drew recruits from their brethren established in England; and Mr. Chalmers supposes that, their power being thus progressively augmented, they gradually acquired a complete ascendancy in all the southern parts of the kingdom, and communicated to it their language and manners. (*Caledonia*, ii. 7.) This, however, would have been an extremely difficult task; but if, which seems abundantly certain, we conclude, with Pinkerton, that the Picts, who were in possession of all the low country in the sixth century, were congenerous with the Saxons, by whom it was then invaded, the two races would readily amalgamate, and the early prevalence of the Scandinavian or Gothic tongue in the lowlands is rationally and satisfactorily accounted for.

Towards the end of the eighth century, a fresh colony from Ireland established itself in the district now known by the name of Galloway, the S.W. part of Scotland. But though these colonists succeeded in giving a name to the country, they were not sufficiently numerous to introduce their language into common use.† And for several centuries, long indeed before the inhabitants had any considerable intercourse with other parts of the kingdom, the Saxon tongue has been in as universal use in Galloway as in any part of the lowlands of Scotland.

Exclusive of the Celts, Goths or Picts, Romans, Scots, Irish, and Saxons, colonies of Danes and Norwegians established themselves in Caithness, and other parts of the mainland, as well as in Orkney and Shetland, and parts of the Western Isles. Generally, however, it may be said, notwithstanding the late great influx of Irish settlers into Glasgow, Paisley, and other towns, that at present the inhab. of the Lowlands of Scotland are principally of Saxon, while those of the Highlands, with the exception of Caithness, are almost entirely of Celtic extraction.

**Population.**—We have few data to guide us in estimating the amount of the pop. previously to the period of the Union, in 1707, at which time Scotland is supposed to have had about 1,050,000 inhab. In 1755, the pop. was ascertained by Dr. Webster to amount to 1,265,000; and since 1801 its progress has been as follows:—

Counties.	1801.	Inc. per cent.	1811.	Inc. per cent.	1821.	Inc. per cent.	1831.	Inc. per cent.	1841.		Total.

Note.—The returns for 1841 include 4,715 persons resident in barracks in various counties, and 1,775 persons on board ships in harbours.

This increase, though rapid, is less than the increase of the pop. of England during the same period; and it is also, much less than the increase in Ireland from 1801 to 1831. This, however, is a favourable system, for these

are good grounds for thinking that the wealth of Scotland had increased more rapidly during the above period than that of either of the other great divisions of the empire; and if so, it is plain, inasmuch as her inhab. have not in-

• See Pinkerton's chapter on the Origin of the Picts, in his *Inquiry into the Early History of Scotland*.

† Galloway, in the Latin writers of the middle time, (Gaelwalla sive Galloway), so called by the Irish who sometime dwelt there, and termed themselves, in their own language, Gael. (*Timothy Pont's Galloway*, in the Appendix to *Symonds's Galloway*, p. 114.)

‡ This influx has been, in all respects, most injurious to the people of Scotland and England, where it has taken place to an equally great extent, without conferring any corresponding advantage on the Irish. (See *Statistics of Great Britain*, 2d edition, i. 397.)

§ The population of the counties marked thus, has decreased between 1831 and 1841.

creased so fast, that their condition must have been proportionally improved; and, in point of fact, they are, speaking generally, in more prosperous circumstances at present than at any former period. Owing to the sterility of the soil, and other causes, the pop. of Scotland is much less dense than that of the sister kingdoms. The increase of pop. has been chiefly in the great towns: during the 10 years ending with 1820, the pop. of the country at large increased 16 per cent., and during the 10 years preceding 1830, 13 per cent.; while the pop. of the large towns increased respectively 26½ and 26½ per cent. during the same periods. The pop. in some of the cos. has latterly rather declined, in consequence of the consolidation of farms, and the extension of sheep walks.

*Agriculture.*—Scotland, from being about the middle of last century one of the worst cultivated countries of Europe, is now one of the best. At this moment, indeed, the agriculture of the best farmed cos. of Scotland is certainly equal, and is by many deemed superior, to that of Northumberland, Lincoln, and Norfolk, the best farmed cos. of England. The proximate cause of this extraordinary progress must be sought for in the rapid growth of manufactures and commerce, and consequently of large towns, and the proportionally great demand for agricultural produce since the peace of Paris in 1763, and especially since the close of the American war. Fortunately, too, the influence of these favourable circumstances was not counteracted by any vicious institutions, or by any thing unfavourable in the mode of letting and occupying land. Next to the opening of new, extensive, and rapidly increasing markets, the wonderful improvement of Scotch husbandry may be ascribed to the prevalence of leases of reasonable length, usually 19 years, and which generally embody clauses to prevent the exhaustion of the soil; the absence of tithes, and, in most instances, of poor rates, and of all oppressive public burdens; the prohibition of subletting, and the inheritance of the lease by the heir-at-law; the introduction of sheep-farming into the Highlands, and the great improvement made in the construction of all sorts of farming implements. The general use of thrashing machines, many of which are impelled by steam, and of ploughs with two horses driven by the ploughman, constitute, in fact, one of the distinguishing characteristics of Scotch, as compared with English agriculture.

Landed property in Scotland, as compared with its extent and value, is in fewer hands than in England, there being probably not more than 8,000 proprietors in the whole country. It is most subdivided in the counties of Fife, Mid-Lothian, Renfrew, and Kirkcudbright, but even in these there are many large estates; and in most other parts of the country the greater portion by far of the land is distributed into very large estates, many of which are held under a system of strict and perpetual entail. It might be supposed that this sort of tenure would be prejudicial to agriculture, but, practically, its effect is not found to be nearly so great as might have been, *a priori*, anticipated. This results from the circumstance of the courts of law having decided that it is illegal to let lands belonging to an entailed estate, either for an unusually long period, or by fines (*Scottie grassums*); so that, in truth, there is little or no difference between the conditions under which entailed and unentailed estates are occupied; and as the proprietors of the former have been empowered to burden the estates, proportionally to their value, with sums laid out on necessary improvements and buildings, they are, speaking generally, in quite as good order, and as productive as the others.

Farms are of all sizes; varying from 50 to 500 acres and upwards in the improved tillage districts, and from 500 to 5,000 acres and upwards

in the hilly and mountainous tracts. Except in a few of the sequestered glens of the Highlands, into which the improved systems have not been introduced, the division of the land is nowhere carried to such an extent as to be prejudicial to agriculture; and, in most parts of the country, farms have been gradually consolidating and increasing in size since the American war. At an average of the kingdom, arable farms may vary from 150 to 300 acres; and pasture farms from 500 to 2,000 acres.

Down to the close of the American war, the farm buildings in most parts of Scotland were mean and inadequate in the extreme. In the Lothians they were commonly ranged in a row, having the dwelling-house in the middle, with a barn at the one end, and cattle-houses at the other. In other parts, they were frequently huddled together without any sort of order. The walls were always low, in most instances of stone and clay, the roof being invariably thatch. The dunghill was universally opposite to the door; and so near it, that in wet weather it was no easy matter to get into the house with dry feet. The change that has taken place in these respects during the last half century has been signal and complete. In none but the least accessible and least improved districts are any of the old houses now to be met with. Perhaps, indeed, the other extreme has not been sufficiently avoided; buildings having, not infrequently, been erected that seem to be both larger and more expensive than necessary. The offices are mostly constructed in the form of a square. In some instances, the dwelling-house makes one of its sides; but in the better class of farms it is removed to some distance from the offices. It is generally two stories high, and is well, and sometimes handsomely, fitted up. Both houses and offices are almost always slated. The expense of buildings is uniformly defrayed by the landlord; but the tenant, for whose accommodation they are in the first instance erected, sometimes pays a percentage upon the money laid out upon them. Sometimes, also, the tenants undertake to carry the materials used in building.

The fences in many parts of Scotland consist of dry stone walls; which, though destitute of beauty, make, when properly built, a capital fence. This species of inclosure seems to have originated in the S. W. Kirkcudbright and Wigton were early subdivided with excellent stone dykes, that are now celebrated all over the kingdom by the name of "Galloway dykes." They are of very various heights, and degrees of goodness; but the best are built double to a certain height, when they are capped with broad flat stones projecting a little on each side, over which others are usually laid single; but sometimes those laid over the cap-stone are made to lock firmly together. The best dykes vary from 5½ to 6 ft. in height; and, where they have been carefully founded, well built, and constructed of good stones, they make a most excellent and a very durable fence. Examples are not rare of their standing for 60 or 70 years without receiving almost any repair. In a few instances they have been found at above 100 years of age, in a state of perfect preservation! But unless they be of superior material and workmanship, they seldom last more than from 25 to 30 years. Most of the dry stone walls now to be met with all over Scotland have been built, sometimes with more, sometimes with less success, after the Galloway model.\*

\* There is an excellent account of the Galloway dykes, with judicious remarks on their construction, in *Smith's Survey of Galloway*, pp. 80, 95.

In respect of farming implements, Scotland has very much the advantage over England. The improved Scotch plough is every where met with in the agricultural districts, and is uniformly drawn by two horses, driven by the ploughman. Iron harrows are common. Thrashing-machines are introduced far more extensively than in England; and there is hardly, indeed, a considerable farm in any part of the country without one. The Scotch labourers have never been so absurd as to attempt to advance their interests by destroying those valuable engines.

Scotland may be divided into three agricultural districts:—Of these the first, or most southerly, extending from the English border to the rivers Forth and Clyde, contains a large extent of mountainous and pasture land. But extensive tracts in Berwickshire and the Lothians, on the E. coast, are naturally fertile, and are farmed with a degree of skill, economy, and success, unequalled almost in any other part of the empire. There are also large tracts of fertile and well-farmed land in Lanark, Renfrew, Ayrshire, Galloway, and Dumfries; but the climate on the W. coast is not so favourable, and agriculture is not so far advanced on that side the island as on the E. The second agricultural division stretches from the Forth and Clyde to the great chain of lakes connected by the Caledonian Canal, that runs from Inverness to the Island of Mull. The mountains in this division are on a grander scale than in the southern division; and the proportion of waste land much greater. It, however, contains some of the finest land in the empire. The carse of Gowrie, stretching from Perth to Dundee, consists of the richest alluvial soil; but its agriculture, though good, is not equal to that of some other districts. Strathern, lying to the W. of Perth, is also very fertile. Most part of the extensive county of Fife is arable, and is, in general, very highly improved. There are also very large tracts of fine land in Forfarshire and Angus, and smaller portions in Aberdeenshire and Moray. The third division of Scotland, or that which embraces the country lying to the N. of the Caledonian Canal and the lakes, is, with the exception of the eastern parts of Ross-shire, and a few patches beside, wild and mountainous. Black cattle, sheep, and wool, are its principal products.

Except in the S.E. counties, oats are grown in far greater quantities than any other kind of grain; and, from more attention being paid to their culture, or the greater suitableness of the climate, or both, the produce is greater than in England, varying from 25 and 30 up to 70 bushels an acre, and even more. Oatmeal, which, till a late period, formed, in cakes and porridge, the principal part of the food of the great bulk of the people, is still in very extensive demand; but, latterly, the use of wheat bread has become very general in the rural districts, as well as in the towns. Turnips and potatoes are successfully cultivated throughout most part of the Lowlands. The raising of the former is, perhaps, nowhere so well conducted as in E. Lothian and Berwickshire. Potatoes have of late been grown in large quantities in some of the E. cos. for the London market; and they form an important article of food in all parts of the country. The practice of taking two white crops in succession has been almost wholly abandoned in the Lowlands.

Dairy husbandry is mostly pursued in the shires of Ayr and Renfrew, in the former of which Dunlop cheese is made; but it is also introduced into Wigtown and other cos. Cows of the

genuine Ayrshire breed are admirable milkers, and the average quantity of butter produced by each has been estimated at upwards of 250 lbs. a year. The Galloway, Fifeshire, and Highland breeds are the best for fattening, and yield, especially the first and last, excellent beef. The Galloway cattle are mostly sent up half fed, to be fattened in Norfolk and Suffolk for the London markets. Three principal breeds of sheep are reared in Scotland: the dun-faced, or Scandinavian breed, said to have been imported into Scotland from Denmark, of which a few are found in the cos. N. of the Frith of Tay; the black-faced, or heath breed, very widely diffused, and very hardy; and the Cheviots, the famous breed native to the Cheviot hills. The latter are now found to thrive in districts that were formerly supposed to be suitable only for the black-faced breed, and have already, to a considerable extent, superseded the latter; the carcass and fleece being both much more valuable.

*Quantity and Value of Agricultural Produce.*—There are subjects as to which there is but little information on which it would be safe to place much reliance. In the statistical tables in the *General Report of Scotland* (111. Append. p. 5.), the arable land is estimated at 5,013,450 English acres: of these the proportion in grass is estimated at 2,480,725; leaving 2,532,725 in tillage, which is supposed to be distributed as follows:—

	Acres.		Acres.
Wheat	110,093	Potatoes	80,000
Barley	280,135	Turnips	407,125
Oats	1,260,552	Fish	16,500
Rye	500	Gardens	52,000
Beans and Peas	118,000	Fallow	218,000

But a great extent of waste land has been brought under cultivation during the last 30 years; and we are also satisfied, from the greatly increased consumption of wheaten bread in Scotland, and other circumstances, that the quantity of land assigned to the growth of wheat has largely increased both absolutely and relatively. In our view of the matter, the extent and distribution of the land in tillage may be set down as follows:—

	Acres.		Acres.
Wheat	350,000	Flax	90,000
Barley	450,000	Gardens	55,000
Oats	1,300,000	Fallow	100,000
Beans and Peas	50,000		
Potatoes	200,000	Total	3,405,000
Turnips	450,000		
Clover	450,000		

Assuming this distribution to be nearly correct, the quantity and value of the crops may be estimated as follows:—

Crops.	Acres.	Produce per Acre.	Total Produce after deducting 1-7th for Seed.	Price per Quarter.	Total Value.
Wheat	350,000	34 qrs.	1,190,000	2s.	2,380,000
Barley	450,000	1	1,450,000	28	2,150,000
Oats	1,300,000	5	6,500,000	25	162,500,000
Beans and Peas	50,000	3	150,000	30	4,500,000
Potatoes	200,000	77.	15,400,000	-	7,700,000
Turnips	450,000	-	-	-	160,000
Clover	450,000	-	-	-	525,000
Flax	90,000	87.	7,830,000	-	-
Gardens	55,000	15s.	-	-	-
Total	3,505,000	-	28,220,000	-	20,327,144

Taking the extent of pasture land and wood land in Scotland, exclusive of heaths, wastes, &c., at 2,500,000 acres, and estimating its produce to be worth, at an average, 3s. per acre, its total value will be 7,500,000, but to this has to be added the value of about 13,000,000 acres of mountain pastures, heaths, and waste land, which has been estimated, apparently with great moderation, at about 1,500,000. Hence the total value of the land produce in Scotland will be—

Value of crops and gardens	20,327,144
pasture and wood land	1,500,000*
uncultivated land and wastes	1,500,000*
Total	23,327,144

The rent of land in Scotland, as ascertained by the Commissioners under the old property tax, amounted, in 1815, to 5,075,244. And it appears from the return previously referred to (see art. BRITISH EMPIRE, l. 456.) that

\* This sum differs from that in the estimate, vol. l. p. 456.; but we are assured it is the more accurate.

the landed rental of Scotland, instead of declining, as many have supposed, has increased in the interval; and that it may be at present (1845) safely estimated at 6,800,000*l.* or 6,000,000*l.*

It is difficult to decide as to the portion of the gross rent which should be set apart as the rent of the 13,000,000 acres of uncultivated land; but there are pretty good grounds for thinking that it does not exceed 650,000*l.*, leaving 5,150,000*l.* or 5,350,000*l.* as the net rent of the arable portion, being at the rate of about 18*s.* 6*d.* an acre. Though there are some considerable exceptions, there can be no manner of doubt that, speaking generally, the arable land of England is superior to that of Scotland; but, in consequence of the greater skill and economy of the farmers in the latter, and of the advantage they enjoy in the possession of leases, and the absence of tithes and poor-rates, they are able to pay decidedly higher rents for lands of equal fertility. The rent of corn land in Scotland varies from 7*s.* to 3*l.* an acre, and occasionally even amounts to 5*l.* and 6*l.* The best pasture land rarely fetches more than 3*l.* per acre; and that which is of a medium quality may vary from 10*s.* to 25*s.*

**Rise of Rent.**—Rent has increased much more rapidly in Scotland than in England. This is ascribable partly to the extreme backward and depressed state of Scotch agriculture till after the peace of Paris, in 1763, and partly to the extraordinary advance it has made since the close of the American war. The entire rental of the kingdom is not supposed to have exceeded 1,000,000*l.* or 1,200,000*l.* in 1770. In 1795 it is believed to have rather exceeded 2,000,000*l.*; and since then it has about trebled! So rapid an increase of rent is probably unmatched in any old settled country, and indicates an astonishing degree of improvement.

**Condition of Occupiers and Labourers.**—We are happy also to have to state, that the wealth of the farmers, and the comfort and well-being of the agricultural labourers, have increased in quite as great a proportion as the rents of the land. We have already noticed the extraordinary improvement that has taken place in farm-houses and offices since the close of the American war, and especially during the present century; and the same improvement is everywhere visible in farming stock and implements; in the furniture and other accommodations of the farm-houses; and in the dress and mode of life of their occupants. We have, indeed, no hesitation in affirming, that no old settled country, of which we have any authentic accounts, ever made half the progress in civilisation and the accumulation of wealth, that Scotland has done since 1763, and especially since 1787.

Some very great improvements have been introduced into agriculture within these few years, and are now rapidly spreading over the country. Among these may be specified furrow-draining, subsoil ploughing, and the use of bone manure. These improvements have already changed the face of various extensive districts. Farms that were formerly wet, late, and suitable only for oats, are now, by the aid of furrow-draining, made thoroughly dry, early, and suitable for any species of crop. The introduction of bone-manure has occasioned a great extension of the turnip culture. The facilities afforded by steam navigation for the conveyance of fat cattle and sheep to the great markets of London and Liverpool, as well as to those of Edinburgh and Glasgow, have also been of vast importance, and have enabled the remotest districts to come into successful competition with those that are most favourably situated. In consequence, agriculture is at this moment in a rapid state of advancement; and the fair presumption seems to be that, great as has been its improvement during the last half century, it will be equal or greater during that on which we are now entering.

The only thing that seems at all likely to defeat this presumption, or to retard the future progress of agriculture, is the fact of the Reform Act having conferred the elective franchise on all occupiers of lands worth 50*l.* a year and upwards. This has been in every respect a most pernicious, ill-advised measure. Formerly the landlords rarely inquired as to the politics of their tenants; and provided they paid them their rents, and managed their lands according to the stipulations in their leases, they might be of any political or religious party they pleased. But now it is altogether different. The landlords, desirous, like other people, of extending their political influence, endeavour to control, or, rather command, the suffrage of their tenants, and to multiply the dependent voters on their estates. In furtherance of these objects, they have not scrupled, in many instances, to resort to intimidation, and to adopt vindictive measures against such of their tenants as have voted contrary to their wishes. This, however, though the most prominent at the time, is but the least evil resulting from the new state of things. It has already led in many instances to a change in the mode of letting land; and there is but too much reason to fear that it may, in the end, subvert that system of giving leases for 10 or 20 years certain

that has been a main cause of the astonishing improvement of agriculture. It has also occasioned, in many instances, a subdivision of farms for the mere purpose of creating voters; and there cannot, indeed, be a question that, however well intended, the conferring the elective franchise on the tenants has been one of the greatest blows ever struck at their independence, and at the prosperity of agriculture. Nor is there any thing in this but what might have been, and in fact was, anticipated from the outset. Tenants, as such, whether they hold farms worth 50*l.* or 500*l.* a year, are about the very last description of persons to whom the franchise should be conceded. Very many of them are indebted to, and dependent, to a greater or less extent, on their landlords; and the few who are independent are so because they have accumulated property, and would, in consequence, have been entitled to the franchise, had it been conferred, as it should have been, on those only who possessed a certain amount of realised property. If that be, as it unquestionably is, the best system of voting that brings the greatest number of independent electors to the poll, and keeps back the greatest number of those that are dependent, the giving the franchise to the tenants and occupiers of land must be about the very worst system, for they are, of all classes, that which is most dependent, and most at the mercy of others.

The condition of the agricultural labourer has, also, as already stated, been vastly improved. With the exception of those districts in the Highlands and Isles, luckily few in number, into which improvements have not yet made their way, the cottages of the peasantry have been mostly rebuilt during the last half century; and though still, in most instances, without the rustic beauty and neatness that so frequently distinguish English cottages, they are far from uncomfortable. In most parts of the country such of the farm-labourers as are married, and have families, receive the greater part of their wages in specific quantities of farm produce, which do not vary with the variations of price; so that, if they be not so well off as the manufacturing work-people, when trade is brisk and prices low, neither are they exposed to suffer like the others, when there is little demand for labour, and prices are high: on the whole, they may, speaking generally, be said to be in decidedly comfortable circumstances. The unmarried servants frequently live in the farm-house. They are almost all excellent ploughmen; all of them are able to read and write; and their sons not unfrequently emerge from obscurity, and attain to distinction.\*

**Manufactures.**—For a lengthened period after the union with England, Scotland made little or no progress in manufactures; and it was not till after the peace of Paris, in 1763, that the public enterprise began to be turned into this great channel, and that a rapid extension took place of most sorts of industry. A considerable depression ensued towards the close, and after the termination of the American war. But it was not of any very lengthened duration; and the foundations of the cotton trade having been laid about this period, manufactures have continued, from 1787 down to the present time, progressively to gain ground in Scotland, and have been prosecuted with equal skill, industry, and success. According to the report of Mr. Stuart, Factory Inspector for 1839, there were in that year the following factories in Scotland:—

		Mills or Facto- ries.	Wrought by Steam.	Wrought by Water.	Persons employed.
Cotton	-	266	193	73	35,376
Woollen	-	155	37	116	40,592
Flax	-	251	160	91	17,597
Silk	-	6	5	-	763
Total	-	676	395	280	59,124

† Of whom 33,387 were upwards of 18 years of age.

In 1834 there were in Scotland 17,721 power-looms, of which 17,531 were employed in weaving cotton fabrics. There has been a very material increase of power-looms in the interval; and exclusive of them there were, in the S. division of Scotland, in 1838, about 51,060 hand-looms for various fabrics, employing, as was

\* The reader who may wish to become more particularly acquainted with the extraordinary changes that have taken place in the agriculture and mode of life of the people of Scotland since 1760, would do well to consult *Robertson's Rural Recollections*. It is at once an authentic, interesting, and instructive work.

estimated, about half that number of families. The cotton manufacture, which principally centres in Glasgow and Paisley (which see), is of comparatively recent introduction, the first steam-engine for a cotton factory having been constructed so late as 1792. But the woollen manufacture has been of long standing, and was formerly much more widely diffused than at present, having been, in fact, with that of linen, a domestic manufacture, and pursued in every cottage. It was the universal practice of the peasantry, and occupiers of land, to spin, at home, the greater part of their own wool, as a subsidiary employment, and to send the yarn to be made into coarse cloth in the nearest village.

There is still a class in Scotland called *customer weavers*, scattered over the country, but now principally confined to the Highlands, employed by private families to weave yarn into coarse fabrics for domestic use. Most of these are also agricultural labourers, weaving only in the intervals of their ordinary avocations; they earn from 1s. to 2s. 6d. a day, but few higher than 1s. 9d. But except these, and persons living at watering-places, and on parts of the E. coast, where they engage in fishing or boat-letting for a part of the year, the great bulk of the weavers of Scotland subsist entirely by the loom, and engage in no other pursuits. (*Symons in Hand-loom Weaver's Rep.*, p. 5.)

At present, and for some time past, this class has been in very depressed circumstances. Owing to the facility with which the business of weaving may be learned, and the sort of independence it confers on the weaver, it has always been a favourite employment; and, consequently, except in periods of great prosperity, the wages of weavers have generally been rather low. Of late years, however, the introduction of power-looms has gone far to supersede, to a great extent, the business of the regular hand-loom weaver, especially of those engaged in the manufacture of cottons; and the fair presumption seems to be, that in no very lengthened period the business of the hand-loom weavers will be totally annihilated. But though there can be no doubt that, in a public point of view, this change will be productive of great advantage, it involves, in the meantime, the class of hand-loom weavers in the greatest difficulties; and, in point of fact, nine tenths of that manufacturing distress of which we have recently (1841) heard so much has proceeded from hand-loom weavers thrown out of employment by the competition of power-looms, or forced to labour for the merest pittance. That such persons are proper objects of public sympathy, none can doubt; and every thing that is practicable should be done to facilitate their employment in other businesses, or their emigration to the colonies. Till such time as this transference has been effected, there will be the same unvarying, and generally unfounded tale of manufacturing distress.

It appears from the statements given in Burns' account of the cotton manufacture for 1840, that the total quantity of cotton spun in England during that year amounted to 368,896,959 lbs., and that spun in Scotland to 37,878,892 lbs. Now, taking the entire value of the manufacture at 35,000,000*l.*, and supposing it to be proportioned in both countries to the quantity of yarn spun in each, that would give about 3,500,000*l.* for the value of the portion belonging to Scotland. We believe, however, that the value of the cotton goods annually produced in Scotland

may be estimated at about 5,000,000*l.*; for a large proportion of the Scotch manufactured articles consist of the finer descriptions of muslins and other superior and costly fabrics, which makes their aggregate value exceed what might be inferred from the comparative amount of yarn produced in Scotland.

Compared with the woollen manufacture of England, that of Scotland is inconsiderable. Flannels, blankets, shawls, plaids, stockings and stocking yarn, tartans, carpets, druggets, &c. are produced to a considerable extent at Galashiels, Hawick, Jedburgh, and Aberdeen. Some of the finer descriptions of cloth are made at Aberdeen and in its vicinity, and some of its woollen mills and factories are on a large scale. Kilmarnock is the seat of a very extensive and flourishing carpet manufacture. The power-loom having hitherto been but little adopted in the woollen manufacture, the weavers employed in this department get good wages, are well clothed and lodged, and in all respects exhibit a marked contrast with the hand-loom weavers engaged in the cotton manufacture.

The linen manufacture of Scotland is of very considerable value and importance: Dundee is its chief seat; and the statements previously given (*see art. DUNDEE*, l. 720.) show that its increase since 1811 has been quite extraordinary. Osnaburghs, sheeting, cotton bagging, sail-cloth, dowlas, and other coarse goods, are the articles principally made in Dundee and in Kirkcaldy, Arbroath, Forfar, Montrose, Aberdeen, and other seats of the manufacture in the E. of Scotland. The finer descriptions of linen fabrics, as damasks, diapers, shirting, &c., are principally produced in Dunfermline and its immediate vicinity. Power-looms have not hitherto been extensively introduced into this department, but they are gradually gaining ground. At present it employs about 17,000 hand-looms in summer, and from 22,000 to 23,000 in winter. The linen weavers occupy an intermediate position between the woollen weavers on the one hand, and the cotton on the other. The silk manufacture is of little importance: its chief seat is Paisley (which see, *anté*, pp. 444, 445.).

The iron-works at Carron, near Falkirk, established in 1760, were for a lengthened period the most extensive in the kingdom; but they are now far surpassed by those of Gartsherrie, Dundyvan, Monkland, &c., in Scotland, and by many in England. A good deal of Scotch iron-mongery, comprising anchors, bolts, axles, mill and engine-work, &c., is exported to the colonies and foreign countries. The manufacture of machinery is an important branch of industry. Coach-making is carried on in all the large towns, and ship-building in many of the ports. Glass wares, chemical products, soap, candles, and starch, are among the other principal manufactured goods.

The favourite beverage of the people of Scotland has, for a lengthened period, been whiskey, a spirit generally distilled from malt or raw grain. Owing to the excess of the duties with which this spirit has occasionally been charged, its smuggling has sometimes been carried to a great extent; but since 1826, when the duties were reduced from 5*s.* 10*d.* to 2*s.* 10*d.* and 3*s.* 4*d.* per imperial gallon, clandestine distillation and smuggling have been comparatively rare. We subjoin an

Account of the Quantities of British Spirits entered for Consumption in Scotland, with the Rates of Duty on the same, and the Amount of Duty in each Year since 1820.

[See top of next column.]

Years.	Rate per Gallon.	Imp. Gallons.	Nett Revenue.
1821	5s. 6d. per wine gall.	2,229,435	£ 757,650 19 7
1822	Do.	2,079,556	£ 691,135 6 6
1823	Do., after Oct. 20, & 2s.	2,532,728	£ 556,651 17 8
1824	Do.	4,550,301	£ 500,624 18 4
1825	Do.	5,381,550	£ 682,848 11 1
1826	2s. 10d. per imp. gall.	3,988,788	£ 563,265 4 0
1827	Do. do.	4,752,199	£ 672,441 6 6
1828	Do. do.	6,716,180	£ 809,550 6 7
1829	Do. do.	5,777,450	£ 818,448 0 0
1830	2s. 10d., & 5s. & 4d. do.	6,007,631	£ 939,258 6 0

In proof of the extraordinary progress made by Scotland, we may state that at the epoch of the union with England in 1707, the revenue amounted to only 110,694*l.* In 1788 it had increased to 1,099,148*l.*; in 1813, when the income-tax was at its height, it amounted to 4,204,074*l.*; and in 1839, notwithstanding the repeal of the income-tax, and of a great number of other taxes, the gross revenue of Scotland amounted to 5,254,624*l.*, and the nett revenue to 4,952,460*l.*—a rate of increase wholly unexampled in either of the other divisions of the United Kingdom. We subjoin an

Account of the Gross and Nett Produce of the Revenue of Scotland in 1844.

**Commerce.**—Having little industry, and being thinly peopled, Scotland had formerly a very limited foreign trade. The exports consisted of wool, skins, hides, and other raw materials, exchanged for corn, wines, spices, &c. Even so late as the era of Cromwell her mercantile marine comprised only 93 vessels, of the aggregate burden of 2,724 tons, and 18 barks. During the reign of Charles II. the trade of the country, especially that with Holland and the countries round the Baltic, began to increase. It was not, however, till after the completion of the Union, in 1707, when the trade to the American and W. Indian colonies was, for the first time, opened to the enterprise and activity of the Scotch, that the commercial energies of the nation began to be awakened. But for a while the merchants of Glasgow, who first embarked in the trade to America, carried it on by means of vessels belonging to English ports; and it was not till 1718 that a ship built in Scotland (in the Clyde), the property of Scotch owners, sailed for the American colonies. *See art. GLASGOW, l. 908.* The establishment and rapid extension of manufactures in Scotland, since 1763, has necessarily occasioned a corresponding increase of commerce, and the mercantile marine of Scotland is now very considerable indeed. In 1828 it comprised 3,143 vessels, of the aggregate burden of 300,836 tons. Such, however, has been its increase in the interval, that on the 31st of December, 1840, it comprised 3,479 vessels, of the aggregate burden of 429,204 tons, manned by 28,428 seamen! The commerce of Scotland too is greater, in fact, than appears from the Customs returns; inasmuch as a good many articles of foreign produce imported at second hand through the English ports, and articles of native produce exported in the same way, do not appear in the list of imports and exports. At present the principal articles of export consist of cotton and linen stuffs, cotton and linen yarn; wool, iron, and hardware; silk goods, coals, spirits, and beer; black cattle; herrings, salmon, and other salted and fresh fish; stationery, &c. The great articles of import consist of tea, sugar, coffee, and other colonial products; raw cotton, flax and hemp, tobacco, raw silk, wine, dye stuffs, &c. We subjoin an

Account of the Gross and Nett Customs Duties collected at the different Scotch Ports in 1839 and 1840.

**Currency.**—The currency of Scotland, for a lengthened period, principally consisted of the notes of the different banking companies. These, for the most part, are joint-stock associations, with numerous bodies of partners, and have been managed with great skill and discretion.

Very few bankruptcies have occurred among the Scotch banks; and they have, no doubt, contributed materially to the improvement of the country by the facilities they have afforded to industries and commerce, serving individuals of obtaining loans; and still more by the practice, which has long been acted upon, of taking very small sums in deposit, and allowing interest upon them at about 1 per cent. below the market rate at the time. This has brought, as it were, a number of substantial and well-organised savings banks within reach of all classes; and by furnishing every facility for the safe and profitable custody of the smallest and largest sums, has powerfully stimulated the desire to save and amass. The deposits in the Scotch banks are supposed to amount, at this moment, to about 27 millions sterling; and we believe it may be safely affirmed, that, but for the facilities that have been afforded for the accumulation of the smaller class of sums, at least 15,000,000*l.* of this amount never would have existed. The amount of the notes of the Scotch banks in circulation may be taken, at an average, at about 3½ millions.

**Roads.**—With the exception of the military roads, constructed in the Highlands after the suppression of the rebellion, in 1745, the roads of Scotland were, speaking generally, in the most execrable state down to the American war. But such and so great has been the improvement in the interval, that they are now quite equal to the best roads in England, and are not, indeed, surpassed by any in Europe. They are laid down on the most approved principles; and, notwithstanding the rugged nature of the country, it is but seldom that horses in a carriage may not be driven along at a smart trot. The facility with which excellent materials for their construction may almost every where be obtained has materially contributed to forward their formation. The roads within what is called the Highland district have been partly constructed by means of advances from government, and the public money has very rarely been so profitably expended.

Within the last few years several railways have been projected, some of which are already completed, and others in a state of great forwardness. They are mostly in the manufacturing districts, of which Glasgow and Dundee are the centres. The principal is that between Edinburgh and Glasgow, about 46*m.* in length. It was begun in 1838, and was completed in 1842, at an expense of about 1,200,000*l.*

Various projects are now on foot for connecting Edinburgh and Glasgow with some of the great lines of railway leading from London to the N. of England; and this junction will, no doubt, be shortly effected. In the mean time, however, an individual may, by means of the railway to Preston or Lancaster, and the mail coaches from the latter to Glasgow or Edinburgh, or the steamers from Fleetwood, near Preston, to Ardrossan, reach Glasgow or Edinburgh from the metropolis in about twenty-four hours! A journey which, so late as the era of the American war, took about a week for its completion!

**Canals.**—Of the Scotch canals, the most important by far is that called the Great Canal, uniting the Firths of Forth and Clyde, and, consequently, forming an easy water communication between the E. and W. coasts of the is-

\* Deducting drawbacks and repayments.

land. Including its branch to port Dundas, in the vicinity of Glasgow, it is about 39 m. in length; the medium width at the surface is 56 ft., and at the bottom 27 ft.; average depth, from 9 ft. to 10 ft.; summit level, 156 ft. above the sea; it has 39 locks. This important work was begun in 1768, but was not finally completed till 1790. It has been as profitable to the shareholders as it is advantageous to the public; the dividend on the original stock having been latterly about 28 per cent.

The Union Canal joins the Forth and Clyde Canal near Falkirk, and stretches thence to Edinburgh, being about 34½ m. in length. It was completed in 1822, but has been, in all respects, a most unprofitable undertaking. Hitherto, the proprietors have not received any dividend, and their prospects, we understand, are but little, if any thing improved.

There are other canals in the vicinity of Glasgow: the Cruinn Canal stretches across the Mull of Cantire; and there is also a canal in Aberdeenshire. But the greatest work of this class in Scotland, or, perhaps, in the empire, is the Caledonian Canal. It stretches quite across the island, through the centre of the Highlands, N.E. and S.W., from the Beaulie Frith on the E. coast to Loch Linnhe on the W. It is chiefly formed by the chain of lakes, including Loch Ness, Loch Oich, and Loch Lochy, which occupy the bottom of the remarkable glen or depression through which it is carried. Its total length, including the lakes, is 58½ m.; but the artificial or excavated part is only 21½ m. At the summit it is only 964 ft. above the level of the W. Ocean.

It is mostly constructed upon a very grand scale, being intended to be 20 ft. deep, 50 ft. wide at bottom, and 122 ft. at top; the locks are 20 ft. deep, 172 ft. in length, and 40 in breadth; and had it been wholly executed as was originally intended, frigates of 32 guns, and merchantships of 1,000 tons' burden, might have passed through it. It was opened in 1822, being executed entirely at the expense of government, from the designs and under the superintendence of Thomas Telford, Esq. The entire cost has exceeded a million sterling. There can, however, be no doubt that it was projected without due consideration, and may be regarded as about the least advantageous public work that has been undertaken for a lengthened period. During the year 1836-37, the total revenue of the canal, arising from tonnage dues and all other resources, amounted to only 2,279*l.*, while the ordinary expenditure during the same year amounted to 3,397*l.*; and it has increased little, if any thing, in the interim. But this is not all. Owing to a wish to lessen the expense, and to hasten the opening of the canal, parts of it were not excavated to nearly their proper depth, while others were executed in a hurried and insufficient manner. Hence the canal does not really admit vessels of above 150 or 300 tons' burden; and owing to the want of steam-tugs on the lakes, these are frequently delayed in making their passage across for a lengthened period. During 1837 and 1838 the works sustained considerable damage; and so large a sum will now be required for their repair and for the purchase of steam-tugs, &c., that it has been gravely debated whether it would not be better entirely to abandon and fill up the canal!

There is naturally, however, a great disinclination to destroy a work which, how inexpedient soever originally, has been executed at an enormous expense; and various schemes have been suggested for relieving the public from the expense of keeping it up without involving its destruction. Among others, it has been proposed to assign it to a Joint Stock Company, on their agreeing to complete the works, and keep them in repair, and an act authorising such transfer was passed in 1840. Hitherto, however, it has not been possible to dispose of it in this way; so that, at this moment (December, 1841), it is not easy to conjecture what is to become of this undertaking.

The constitution of Scotland has been, from the earliest times, what is called a limited monarchy. Originally the parliament, or great council of the nation, consisted of the king, the nobles, and the principal ecclesiastics. Burgesses, or representatives for the towns, were admitted into the Scotch parliament by Robert Bruce, in 1326; and in 1427 the lesser barons, or freeholders in the different counties, were authorised to send representatives; but so little was this privilege valued, that it was hardly exercised for 160 years, or till the reign of James VI., when the freeholders were compelled to send representatives.

Scotland, however, derived little or no benefit from her parliament. The nobility and clergy sat and voted in the same chamber with the representatives of the lesser barons and of the

towns; so that, even if the latter had been more powerful and independent than they were, they could have made no effectual opposition to any measure patronised by the nobility and clergy. In point of fact, however, the representatives of the counties were mere nominees of the great lords; and the towns having neither wealth, population, nor importance, their representatives were necessarily as impotent as themselves. The nobility and clergy were, in truth, for a lengthened period, every thing, and the people nothing.

Even had it been, in other respects, better constituted, the institution of the Lords of the Articles would have rendered the parliament of Scotland good for nothing as a check on the sovereign. This was a committee, consisting of a few members, chosen either directly or indirectly by the crown, to which all matters to be brought before parliament had, in the first instance, to be referred; and which had power to reject such as it disapproved of, and to modify and alter the others in any way it thought proper. This committee had, therefore, a negative before debate; and the whole duty of parliament was confined to meeting for a day or two at the end of the session, to confirm the proceedings of the Lords of the Articles! With such an instrument at his command, we need not wonder at the preponderating influence possessed by the sovereign in the Scotch parliaments; and had their ability to carry laws into effect been, in any respect, equal to the facility with which they could get them passed, the kings of Scotland would have been the most, instead of the least, powerful of European princes.

The Committee of the Lords of the Articles was suppressed at the Revolution; but owing to the defects in the mode of choosing representatives, the constitution of parliament was but little improved by its suppression; and down to the passing of the Reform Act, in 1832, Scotland had the shadow merely without the substance—the disadvantages without any of the advantages—of a representative government. Happily, however, its representative system is now placed nearly on the same footing as that of England. (For further details, see Vol. I. p. 462. and p. 777).

According to the Articles of Union in 1707, the peerage of Scotland is represented in the House of Lords of the United Kingdom by 16 peers, chosen by the whole body of Scotch peers at the commencement of each parliament: it was then also arranged that the cos. of Scotland should be represented in the H. of C. by 30, and the bors. by 15 mems. This arrangement was continued till 1832, when the borough representation received an addition of 8 mems., the mems. for the cos. continuing as before.

*Courts of Law.*—The Court of Session, which was constituted by an act of the Scottish parliament in 1537, is the highest civil court of Scotland, having jurisdiction in all civil questions of whatever nature. It was intended to supply the place of the previously existing courts, and more especially of a judicial committee of parliament called the "lords of session," whence the name of the court and the titles of the judges. Originally it consisted of 7 laymen and 8 churchmen, including the president. In 1640, however, an act was passed, providing for the exclusion of churchmen from the court; and, though repealed in 1661, the principle laid down in it has ever since been acted upon. Other important improvements were introduced at different periods, particularly after the Revolution, when the right of appeal from the court to parliament was, for the

first time, recognised. At the Union power was given to all individuals who considered themselves aggrieved by judgments of the Court of Session to appeal to the H. of Lords; and it is a curious fact, that, at this moment, and for a lengthened period, the principal judicial business of the H. of Lords has consisted in hearing and deciding Scotch appeals. Originally, and down to 1808, the whole 15 judges sat together in one court; but in that year an act was passed dividing the court into two chambers, the lord president presiding in the first division of 7 judges, and the lord justice-clerk in the second, of 6; the two remaining judges trying cases in the first instance, or, as it is technically termed, sitting as lords-ordinary. Since then the number of judges has been reduced to 13; 4 belonging to each of the divisions, and 5 acting as lords-ordinary, or sitting as single judges. The judges were at first chosen by the Scotch parliament; but since 1554 they have been appointed by the crown. They are indifferently styled lords of session, or senators of the College of Justice, which last embraces the whole body of barristers (advocates), and attorneys or solicitors who practise before the court. They must be 25 years of age; and, by the treaty of union, no person can be named to the office unless he have served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten. The salaries of the ordinary judges have recently been raised to 3,000*l.* a year each; those of the lord justice clerk, and lord president, being, respectively, 4,000*l.* and 4,500*l.*

At its outset the court of session was intended to serve as a standing or perpetual jury for the trial of cases; the introduction of petty juries into the trial of civil cases in Scotland being only of very recent date, as well as of limited application. It was, in fact, unknown till 1815, when a special or jury court was instituted, for the trial of cases involving questions as to the value of property, the amount of damages, or the determination of some fact. But in 1830 this court was suppressed; and the court of session now avails itself of the assistance of petty juries in the trial of the above description of cases.

The High Court of Justiciary was remodelled, and placed nearly on its present footing, in 1672. It consists of five judges of the court of session, specially commissioned by the sovereign, together with the justice-general and justice-clerk; the former, or, in his absence, the latter, being president. In 1836, the office of lord justice-general was conjoined with that of lord president of the court of session. The jurisdiction of this court extends to all criminal cases, except those of high treason, which are tried by a special commission, in the English form, on the finding of a *grand jury*, which is not used in other cases in Scotland. The judgments of the court of justiciary are final, no appeal lying from them to the H. of Lords. Circuit or assize courts are held twice a year, by the judges of this court, in the principal towns of Scotland, two judges usually going on each circuit; and an additional circuit-court is held at Glasgow during the Christmas holidays. The circuit-courts have power to decide in appeals from inferior courts, where the subject in dispute does not exceed 25*l.* Cases brought before the justiciary court are tried by petty juries of 15 persons, who decide by a plurality of votes, not being compelled, as in England, to give unanimous verdicts. It is not going too far to say, that, down to a very recent period, this was, in as far as respects political cases, one of the

most corrupt, and worthless tribunals in Europe. Owing, as has been previously stated (*see vol. i. 463.*), to the mode in which juries were selected, it was always in the power of the lord advocate, or public prosecutor, to get a jury appointed favourable to his own views; and the judges, having been appointed by the crown, and looking to it, most probably, for farther advancement for themselves or their families, were, with few exceptions, obsequious tools. Hence, in Scotland, to be prosecuted for a political offence was, for a lengthened period, nearly equivalent to being condemned. Luckily, however, this disgraceful state of things has been thoroughly reformed. Juries in Scotland are now fairly selected; the accused has the same right of peremptory challenge as in England; so that, however disposed, the judges can no longer dictate verdicts. The old court of exchequer, commission of teinds, admiralty and consistory courts, are now merged in the court of session.

The inferior courts of law are those of the boroughs, justices of the peace, and sheriffs. The first are called "baillie" courts, from being presided over by a baillie or alderman, with, in some cases, the assistance of a legal assessor. Their civil jurisdiction within the borough depends on circumstances, being sometimes nearly equivalent to that of sheriffs in cos.; but their criminal jurisdiction extends only to petty riots and common police offences. The justices of peace decide without appeal in actions where the demand does not exceed 5*l.* besides costs. They commit criminals and hold petty sessions, at which two are a quorum, and quarter sessions; but have in no instance the power of transportation.

The sheriff courts are very important, and transact most of the county business. Each co. has a principal sheriff, called a sheriff-depute, from his being deputed or appointed by the crown; who, in addition to duties similar to those devolving upon English sheriffs, has a very extensive civil jurisdiction. He holds office *ad vitam aut culpam*, his salary varying from 300*l.* to 800*l.* a year, according to the supposed onerousness of his duties. In the cos. of Edinburgh and Lanark, the residence of the sheriff-depute is enforced; but in the other cos. he is rarely resident, his presence not being necessary, except on particular occasions. Sheriff-deputes are, in fact, usually practising lawyers in Edinburgh, and the ordinary business of the co. is devolved on the sheriff-substitutes, or deputies of the principal, who are always resident. In extensive cos. there are usually several sheriff-substitutes. This very useful class of judges must be chosen from advocates, writers to the signet, solicitors of the supreme courts, or solicitors of three years' standing before a sheriff court; and, though nominated by the sheriff-depute, they cannot be displaced without the concurrence of the lord president and lord justice-clerk. At present their salaries, which were raised in 1840, vary from 300*l.* to 550*l.* a year, exclusive of fees. The sheriff, or his substitute, holds small-debt courts for the decision of questions of debt and costs to the amount of 8*l.* 6*s.* 8*d.*, in which the pleadings are all *riya voce*, the expense small, not exceeding 2*s.* 6*d.* or 3*s.*, and the judgment final. In his ordinary courts, however, the authority of which extend to all personal actions without limit of amount, the pleadings are mostly in writing. Until a comparatively late period the sheriff exercised a criminal jurisdiction, extending in some cases to capital punishment; but his powers, in this respect, are now greatly abridged. He still

occasionally tries criminal cases with a jury, but the sentence may be appealed from to the court of justiciary. No sentence, except for petty offences, involving fine, imprisonment, or, at most, banishment from the county or borough, can be pronounced by any legal authority in Scotland without a jury; nor can any person be now imprisoned for any debt under *8l. 6s. 8d.*

*Religious Establishments.* — The Roman Catholic religion, and the jurisdiction of the pope, were abolished in Scotland in 1560; a confession of faith, on Calvinistic principles, drawn up by the celebrated John Knox, was then also agreed to, and the Protestant religion was established by an act of the legislature. Knox, having studied under Calvin at Geneva, introduced the Genevese or Presbyterian form of church government; but, though organised, it did not receive the sanction of the legislature till 1592. After the accession of James VI. to the throne of England, he endeavoured, notwithstanding the strenuous opposition of the great bulk of the nation, to re-establish episcopacy; and a struggle was carried on between the abettors of episcopacy and presbytery, who alternately prevailed, according as the court or popular party happened to have the ascendancy, till the Revolution, when presbytery was definitively established.

Some, however, of the parishes are collegiate, or have two clergymen; and latterly some of the more extensive parishes have been divided, and assistant, or *quoad sacra* ministers have been appointed to them. These are called *quoad sacra* or *quoad spiritualia* ministers because they are not entitled to participate in the civil endowments belonging to the parish, and are wholly supported by a sum granted annually by the sovereign. These *quoad sacra* clergymen, of whom there are 41, were admitted, by an act of the General Assembly of 1833, members of presbyteries, and other church courts. But this act has since been found to be illegal.

At present, and since the reign of Queen Anne (1712), the privilege of appointing clergymen to parishes has been vested in the crown or in private patrons, with the proviso that they must be selected from among those who have gone through the course of study prescribed by the church, and been examined and licensed as preachers by a presbytery. The right of patronage has long, however, been exceedingly unpopular. Its enforcement, in despite of public opinion, occasioned the great secession from the church in 1741; and latterly it has become more unpopular than ever. The General Assembly, by a measure, called the *veto* act, passed in 1834, gave the congregations belonging to parishes a right to reject a presentee, if he were not acceptable to them; but (unfortunately, as we think,) it was decided first by the court of session and subsequently by the H. of Lords (3 May, 1839) that the general assembly had no power to pass the *veto* act, and that all proceedings under it were null and void. This decision was not, however, submitted to by the majority of the assembly, by whom it was regarded as a usurpation upon their rights; and no legislative measure having been proposed calculated to allay the public irritation, or to mitigate the extreme exercise of the right of patronage, the leaders of the dominant party in the assembly determined to secede from the church. Accordingly on the first day (18 May) of the meeting of the general assembly of 1843, the ministers and elders, members of that body, opposed to the right of patronage and in favour of the *veto*, gave in a Protest, stating, among

other things, that "The courts of the church as now established, and members thereof, are liable to be coerced by the civil courts in the exercise of their spiritual functions; and in particular in their admission to the office of the holy ministry, and the constitution of the pastoral relation, and that they are subject to be compelled to intrude ministers on reclaiming congregations in opposition to the fundamental principles of the church and their views of the Word of God, and to the liberties of Christ's people." And this protest having been read, the protesters withdrew to a separate place of meeting, and constituted themselves, and such as might afterwards adhere to them, into a body to be denominated the FREE CHURCH OF SCOTLAND. The Protest was signed by 125 ministers and 77 elders. But within a few weeks, no fewer than 470 clergymen seceded from the establishment, and joined the Free Church. Of these, 273 were parish clergymen, being nearly a third part of the total number of those belonging to the establishment. The rest were *quoad sacra* ministers. And whatever may be thought of its wisdom, this proceeding sets in a striking light the sincerity and zeal by which the seceders were animated. The voluntary abandonment by so many individuals of their homes and incomes, rather than hold them by compromising what they believed to be a fundamental principle, reflects the highest credit on the Scottish church and character.

As might be expected, the Free Church embraces a large body of lay adherents. In May 1845 no fewer than 570 churches had been built for the accommodation of its members; 70 more were, at the same time, in the course of being built; and others were projected. It had then, also, 613 ordained clergymen, and 197 congregations without ministers. Very conflicting estimates have been formed of the total numbers of those within the pale of the Free Church; these being exaggerated by its friends, and underrated by its opponents. On the whole, however, they may perhaps be safely estimated at about 600,000.

Nothing, perhaps, has been so extraordinary, in connection with the history of this secession, as the zeal and liberality displayed by the public in subscribing funds for the building of churches and the support of the clergy. These amounted in May last (1845) to the very large sum of 776,453*l.*, of which not 10 per cent. was unpaid. Additional subscriptions continue to come in. The erection of a college in connection with the Free Church has been commenced in Edinburgh: and it is intended to build houses (maisons) for the accommodation of the clergymen.

But while there is much to applaud in this display of zeal and liberality, we cannot help regarding the late secession as fraught with many inconveniences, and regret that measures were not taken to prevent its occurrence. We said in the former edition of this work, "It were much to be wished that this question were satisfactorily disposed of. No doubt there are numerous difficulties in the way, but they are far from being insuperable; and we are clear that either the privilege of selecting their clergymen should be given to parishes, or that they should be authorised peremptorily to reject any presentee not acceptable to them. The latter, perhaps, would be the least exceptionable mode of disposing of the question; and it might at once be effected by giving the *veto* act of the General Assembly the force of law. This privilege is, in fact, of the very essence of presbytery. It is

entirely a popular institution; and it is idle to suppose that those who are conscientiously attached to it should ever approve a system of absolute patronage. That control over the election of clergymen, for which the majority of the clergy and people of Scotland are now contending, is not only right and proper in itself, but is in keeping with the other institutions of the country. All magistrates of boroughs, members of parliament, and other functionaries, are now chosen by popular election; and we have yet to learn why a different practice should be followed in the case of clergymen; and that they, whether acceptable or not, should be thrust upon the public. Such a system is sure, in the end, to destroy itself. To keep it up can serve no purpose, unless it be to lessen the utility of the church, to occasion agitation, and to add to the number of dissenters.

What has since occurred has fully demonstrated the truth of these statements. Had the *veto* act been passed into a law, the disruption of the church would not have occurred; and we believe we may, also, safely affirm that the *veto* would not have been exercised in one case out of twenty. Patrons would have seen the wisdom of deferring (as many of them do at present) to the wishes of congregations, and the *veto* would rarely have been heard of. Now, however, the established church is no longer the church of a decided majority of the people; and has ceased to enjoy much of the respect and influence that formerly belonged to it. Religious animosities and fanaticism have also been widely diffused; so that, on the whole, there is good cause to regret the not giving a legal effect to the *veto* act of the general assembly.

A presbytery consists of the clergymen of an indefinite number of contiguous parishes, and of an elder from each kirk session. It has cognizance of all ecclesiastical matters within its limits; examines, licenses, or rejects preachers or candidates for the ministry, reviews the decisions of kirk sessions, &c. Originally presbyteries met every week, but now, in general, only once a month. Appeal may be made from their decisions to the synods.

A synod consists of the clergymen of an indefinite number of contiguous presbyteries, with an elder from each of the different kirk sessions. This court, which usually meets twice a year, reviews the decisions of presbyteries; but its own decisions may be reviewed by the General Assembly, the highest ecclesiastical authority in the kingdom. We subjoin

A Statement, exhibiting an Account of the Number of Synods, Presbyteries, Parishes, and Clergymen, belonging to the Church of Scotland.

Synods.	Presbyteries.	Parishes.	Clergymen.
Synod of Lothian and Tweeddale -	7	120	128
Morse and Tiviotdale -	6	66	66
Dumfries -	5	56	56
Galloway -	5	37	37
Glasgow and Ayr -	8	155	159

Glenelg -	5	41	41
Orkney -	3	20	21
Shetland -	2	14	14
Total number - 16 Synods -	80	1,025	1,050

The Scotch church is a perfect democracy, all the members being equal, none of them having any power or pre-eminence of any kind over another. There is in each parish a parochial tribunal, called a kirk session, consisting of the

minister, who is always resident, and a greater or smaller number of individuals, of whom, however, there must always be two selected as elders. The principal duty of the latter is to superintend the affairs of the poor, and to assist in visiting the sick. The session interferes in certain cases of scandal, calls parties before it, and inflicts ecclesiastical penalties. But parties who consider themselves aggrieved, may appeal from the decisions of the kirk session to the presbytery in which it is situated, the next highest tribunal in the church.

The GENERAL ASSEMBLY, which consists partly of clerical and partly of lay members, chosen by the different parishes, boroughs, and universities, comprises 386 mems., as follows:—

Eighty Presbyteries send, ministers	-	-	-	218
elders	-	-	-	94
City of Edinburgh, elders	-	-	-	2
Sixty-five other royal burghs	-	-	-	65
University of Edinburgh,	} one minister or one elder each	}		
University of Glasgow,				
University of St. Andrews,				
Marischal College, Aberdeen,				
King's College, Aberdeen,			5	
Churches in India, a minister and an elder			2	
Total number of members	-		-	-

The General Assembly meets annually in May, and sits for 10 days; but it has power to appoint a commission, with powers equal to its own, to take up and consider any matters it may have left undecided. The Assembly is honoured during its sittings with the presence of a nobleman, the representative of the sovereign, with the title of Lord High Commissioner. He is merely, however, a state appendage, and cannot interfere in any way with its proceedings. All matters brought before the Assembly are decided, after debate, by a vote. Party sometimes runs as high in the Assembly as in the H. of C.; and the discussions are frequently as acrimonious as eloquent.

The stipends of the Scotch clergy are principally derived from the wreck of the tithes and other property that belonged to the Rom. Cath. church, which was principally seized upon at the Reformation by the nobility and gentry. The court of session, as commissioners of teinds (tithes), have power from time to time to augment, as they may think fit, the livings of such clergymen as may not be already in the receipt of the whole disposable tithes of their respective parishes. But in many parishes the tithes have been wholly taken up or exhausted; and in 1812 an act was passed to raise, at the public expense, the incomes of such clergymen as had less than 150*l.* a year, exclusive of glebes and houses, to that sum. At this moment (1845) the average income of the clergy of the church of Scotland, exclusive of the ministers of *quoad sacra* parishes, amounts to about 200*l.* a year, over and above their glebes and houses, the average value of which may be estimated at about 30*l.* a year.

The dissenters from the church, exclusive of the adherents of the Free Kirk, consist principally of the members of the United Associate Synod, Burgher Synod, and Relief Synod. This secession took place in 1741, in consequence, as already stated, of the enforcement of the law of patronage. There are some other bodies of dissenters; and of late years, owing to the influx of Irish into the western cos., the Roman Catholics have received a great accession of numbers. The doctrines of the Church of England have also become fashionable among a good many of the higher classes. On the whole, however, the number of dissenters has been very greatly exaggerated; and at this moment (1845) we do not suppose that, altogether, they exceed 700,000, or, at the outside, 750,000.

*Public Instruction.*—An endowed school has been for a lengthened period established in every parish in Scotland. The landlords are bound to build the school-house, and a house for the residence of the master, and to pay him a salary, which, at present, varies from 25*l.* 13*s.* 6*d.* to 34*l.* 4*s.* 5*d.* The power of nominating and appointing schoolmasters is vested in the landlords and minister of the parish. It is usually expected that a Scotch parochial teacher, besides being of unexceptionable character, should be able to instruct his pupils in the reading of English, the arts of writing and arithmetic, and the more useful branches of practical mathematics, and be possessed of such classical attainments as qualify him for teaching Latin and the rudiments of Greek.

Exclusive of the statutory allowance, schoolmasters receive fees from their pupils, according to a scale regulated by the landlords and clergymen. They are in general very moderate, varying, for the different branches of education, from 1*s.* 6*d.* to 7*s.* 6*d.*, and, in a few instances, 10*s.* a quarter. An efficient system of education has, in consequence, been brought within the reach of all classes, and has been productive of the greatest advantages.

In the largest country parishes there are often subsidiary schools, established by the landlords, the masters of which are allowed a portion of the statutory salary; and in all the more considerable towns by far the greater proportion of the children are educated at non-parochial schools. Speaking generally, classical instruction is not carried to the same extent, in any of the Scotch schools, that it is carried in Eton, Harrow, and the higher class of English schools; but, on the whole, they furnish an extremely good and useful education.

Several returns have been published of the number and description of the various Scotch schools, and of the number of young persons of both sexes by whom they are attended. But these returns are all very incomplete, and are, in fact, little better than worthless. At an average, we believe, it may be estimated that from an eighth to a tenth part of the inhab. of Scotland are at schools or academies of one description or another.

The higher branches of education are taught in the universities of Edinburgh, Glasgow, Aberdeen, and St. Andrew's (which see). Each of these universities has faculties of literature, philosophy, law, and medicine. A religious test may be required from the professors, but not from the students; the latter do not live in college halls, as in the English universities, and are not subject to any college jurisdiction when beyond the walls of the university.

Edinburgh University was long celebrated as a medical school, and still, indeed, preserves some considerable portion of its ancient celebrity. Probably, on the whole, the instruction afforded by the Scotch universities, though in many respects defective, is as good as can reasonably be expected, so long as the vicious practice is followed of allowing the professors to judge of the qualifications of candidates for degrees and literary honours; that is, of the merits of their own pupils, and, by consequence, of the solidity and efficiency of their own plan of instruction. The Scotch universities labour under great disadvantage, from the want of a superannuation fund. The professors, having no resource on which to fall back in the event of their getting into ill health, are frequently obliged to cling to their chairs, as a means of subsistence, long after they have been disabled, by sickness and otherwise, from a proper discharge of their duties.

*Language and Literature.*—It has long been a prevalent opinion that the English and Scotch languages are merely different dialects derived from the same common source; and there are very good grounds for thinking that this opinion is correct. There is, however, no reason for concluding, as some have done, that the Scotch is merely a corrupt dialect of the English. It is quite as ancient as the latter; and both, in fact, are dialects derived from the same original tongue. The Gothic occupants of the lower parts of England and Scotland did not all come from the same parts of the Continent, so that there would most probably be at the epoch of their immigration considerable differences in their dialects; and while these, on the one hand, would be diminished by their intercourse with each other in their new settlements, they would, on the other hand, be, in some instances, likely to be increased by their intercourse with the Celts and ancient inhabitants of the country, and with

new comers; till, at last, they would be moulded into new dialects of the same common language. One of the most ancient existing specimens of the Scotch language is a poem on the death of Alexander III. in 1288, written soon after the event. Barbour, a contemporary of Chaucer, is also a distinguished writer; and the language was farther improved and perfected by James I., Cunbar, and Douglas, bishop of Dunkeld, translator of Virgil, &c. But since the union of the crowns, and especially since the union of the kingdoms in 1707, the Scotch has been gradually giving way to the English, and it is now used only by the vulgar and illiterate. The poems of Burns, and some of Scott's novels, have tended, in no ordinary degree, to perpetuate and popularise the Scotch language; but notwithstanding their powerful influence, the fair presumption seems to be, that, at no very remote period, it will wholly cease to be a spoken language. In fact, it may be said to be almost extinct already; for, though most persons use Scotch words in their ordinary conversation, there are now very few, indeed, if any, even among the lowest classes, who speak Scotch without a large intermixture of English.

The Erse or Gaelic, the language generally spoken by the lower classes in the Highlands, is, no doubt, the language of the ancient occupants of the country. It differs but little from the Irish; so little, that after a short intercourse, persons speaking Irish and those speaking Erse have no difficulty in understanding each other. But it is a curious fact that the Irish and Erse are wholly unintelligible to the Welsh. The Maiks, or native language of the Isle of Man, is a dialect of the Erse or Irish.

It would be useless in a work of this kind to enter upon any statements with respect to the literature of Scotland. It is sufficient to say that there are but few departments in which it cannot boast of writers of the highest excellence. Speaking generally, its literature, as contrasted with that of England, may, perhaps, be said to be less learned, less practical, and less playful; and to be more metaphysical, scholastic, and sustained. It would not, perhaps, be very difficult to specify the causes which have occasioned this difference in the literature of the two divisions of the island; but, owing to the more intimate connection that now subsists between the people of both, it is probable that it will gradually become less perceptible.

Down to a comparatively recent period the Scotch newspaper press was alike inefficient and degraded. This was not a consequence of any indifference on the part of the public to newspaper discussions, but was wholly ascribable to the corrupt state of the court of judicature. Full scope was given to the panegyrists of the government of the day, how worthless soever it might be; but any one who happened to question its merits, or who ventured to espouse or recommend any doctrine or theory not approved by the lord advocate for the time being, was, in fact, at the mercy of the latter, and might be banished almost at pleasure. The servility of the judges, and the facility of packing juries, afforded the agents of government a ready means of crushing any obnoxious writer; and, in fact, it may be said that Scotland had no newspaper press, or none worthy of the name, till after the close of last war. During the year ending the 5th January, 1841, 73 newspapers were published in Scotland, to which 4,751,043 stamps were issued.

The establishment of the *Edinburgh Review*, in

1802, is an important epoch, not only in Scotch, but in European literature: it effected a total and most advantageous change in the previous style of criticism and periodical writing.

*The Provision for the Poor* that has long existed in Scotland originated, like that of England, in attempts to repress mendicancy. The acts of the Scottish parliament in reference to this subject bear, in many respects, a close similarity to the English acts, and are partly, indeed, copied from the latter. They differ, however, from the English laws in this important respect, that they make provision only for the maimed and impotent poor, and not for those who are able-bodied; and it is now generally laid down by the best authorities that the latter have no title to claim relief as matter of right. The administration of the poor laws in Scotland differs extremely from their administration in England; and to this, more than to any difference in the laws themselves, the wide discrepancy that now exists between the provision for the poor in the two countries is mainly to be ascribed. In Scotland the administration of the poor's funds is usually vested in the kirk sessions; but, at the same time, any landlord may call the session of any parish in which he has property to account for their administration of those funds, and may attend and vote at their meetings in reference to such matters. No justice of the peace, sheriff, or other inferior judge, is permitted to interfere with the proceedings of the kirk sessions and landlords in their conduct of the affairs of the poor; and as the members of the sessions consist, for the most part, at least in country parishes, either of landlords or farmers, holding under leases of considerable length, they have always been anxious to keep the charge for the poor within the narrowest limits.

So economically, indeed, have the poor's funds been administered, and so anxious have the administrators been to allow none but really necessitous persons to participate in them, and to keep the allowances as low as possible, that assessments for the support of the poor have not been introduced into more than about a third part of the parishes of Scotland, and that in the others the poor are supported by collections made at church doors, and other voluntary contributions. "The Scotch," to use the words of a Report by the General Assembly in 1820, "have uniformly proceeded on the principle, that every individual is bound to provide for himself by his own labour, so long as he is able to do so; and that his parish is only to make up that portion of the necessities of life which he cannot earn or obtain by other lawful means. Even in cases of extreme poverty, the relations and neighbours of the paupers have a pride in providing for their necessities either in whole or in part. This circumstance will account for the small number of paupers in some very populous parishes; and serves at the same time to explain a fact which is obvious in so many returns in the country districts, that the sums given to paupers appear to be so disproportioned to what their real necessities require. A small sum given to aid their other resources affords them the relief which is necessary; and it would be both against the true interests and the moral habits of the people were a more ample provision made for them by their parishes."

Lastly, however, an opinion has been gaining ground that, under the existing system, economy has been carried to an excess; and that the really necessitous poor are not adequately provided for; and there can be no doubt that this opinion is

perfectly well founded. The statements in Dr. Alison's valuable publications, and those previously laid before the reader in the articles *EDINBURGH* and *GLASGOW* in this work, exhibit a state of things that calls loudly for alteration and amendment. Economy is not the only thing to be attended to in the administration of the affairs of the poor. No doubt it is a most important consideration; but the claims of humanity are not to be trampled under foot for its sake, as they certainly have been in many parts of Scotland.

In unison with this feeling, government appointed, in 1843, a commission to inquire into the state of the poor in Scotland, and into the administration of the laws for their relief; and the report of the commissioners, though in many respects most defective, fully showed the extreme inadequacy of the provision made for the relief of the poor, and the necessity of its augmentation. A bill, founded in part on the recommendations of the commissioners, has been introduced into parliament in the course of the present year (1845), and will no doubt be passed into a law. It establishes a board in Edinburgh for the supervision of the affairs of the poor, and makes some judicious alterations. On the whole, however, it seems to be a very inadequate measure. Little more, in fact, was required except to simplify some parts of the existing law, and to have given the poor a right of appeal from the decisions of the kirk sessions, to some less partial and easily accessible tribunals, such as the sheriff's courts of the different counties. But instead of facilitating the power of appeal on the part of the poor, the new measure throws increased obstacles in its way, and is in so far objectionable. Its principal value consists in its admitting the defects of the existing system, and being the first step taken for its improvement.

*Historical Sketch.*—The early history of Scotland is at once obscure and uninteresting. The country was long one of the most barbarous in Europe; and though Kenneth II. (anno 838) is said to have united the extensive territories from the Tyne N. to the Pentland Frith into one kingdom, it is abundantly certain that various extensive districts were in a great measure independent of the crown for several centuries after this period. In consequence of their early holding Northumberland, Cumberland, and other lands in England, the kings of Scotland were accustomed to appear in the English court to perform homage for these possessions; in the same way as the English monarchs were themselves accustomed to perform homage to the kings of France for Normandy and the other provinces held by them in that kingdom. (*Stuart's Public Law of Scotland*, note viii.) On the extinction of the direct line of the Scottish kings in 1290, by the death of Margaret of Norway, John Baliol and Robert Bruce, descendants of the Scottish king David I., appeared as competitors for the crown. The pretensions of both were supported by powerful parties; and, to avoid a civil war, it was agreed to refer the matter to the amicable decision of Edward I., king of England. This able and politic prince availed himself of the opportunity to advance the principle, for which the homage that had been performed by the Scotch princes for their English possessions afforded a colourable pretext that the kings of England were the paramount sovereigns or liege lords of Scotland, and that the competitors for the crown should do homage to him as such: This was consented

to; and Edward, finding Baliol most suitable to his views, decided in his favour. The latter, however, being less subservient than was expected, was speedily set aside by Edward, who attempted to seize the kingdom on pretence of its having escheated to him through the rebellion of his vassal.

The nation, however, was not to be so transferred. Sir William Wallace raised the standard of independence; and in the sequel, the famous Robert Bruce, grandson of the competitor of Baliol, appeared in the field; and after unparalleled exertions, continued through a series of years, the great victory of Bannockburn (1314) secured the independence of Scotland, and established the conqueror and his family on the throne.

The only daughter of Robert Bruce having married the lord high steward, Robert, the issue of that marriage, and the first of the family of Stuart who arrived at the royal dignity, succeeded to the crown on the death of David II., in 1371. From this period, the history of Scotland is comparatively well known; and the continued and extraordinary ill fortune that attended the lengthened series of princes of the House of Stuart has vested it with more than ordinary interest.

The principles of the reformers were early introduced into Scotland, and were eagerly adopted by the great bulk of the nobility and people. The Protestant religion obtained the ascendancy in 1560, shortly before the return of the beautiful, but ill-fated Queen Mary from France, where she had been sent to be educated. At this period the royal authority was at a very low ebb; the most violent contentions prevailed amongst the nobility; and it would have required a sovereign of no ordinary ability and energy of character to conduct the government under such difficult circumstances. We need not, therefore, be surprised at the failure of Mary, who, though not without good talents, was wholly inexperienced, at the same time that she had the misfortune to have been strongly imbued with anti-Protestant prejudices, and that the violence of her passions made her sacrifice her own reputation and innocence, and the well-being of the kingdom, to their gratification.

Having been deposed in 1567, Mary was succeeded by her son, James VI., then a minor. The latter succeeded, on the demise of Queen Elizabeth, in 1603, to the crown of England, when the two British kingdoms were happily united under one sovereign. (*See* vol. i. 790, &c.)

From the accession of the House of Stuart to the union of the crowns, a period of about 230 years, Scotland, speaking generally, was in a most unsettled, turbulent state. The feudal system had been early introduced into the country; and the great estates and influence enjoyed by several of the nobles enabled them to rival the sovereign in power and importance, and sometimes to despise his orders, and insult his person. In France, England, and other countries, the sovereigns, by enfranchising the inhabitants of the great towns, and attaching them to their interests, succeeded, through their assistance, after a lengthened struggle, in abating the pride and independence of the barons, and reducing them to obedience. But the kings of Scotland had no such support on which to fall back: there was not, in fact, a single great town in the kingdom; and they had nothing to trust to but the supplies of men and money they could draw from the crown estates, and from the contributions of such of

their vassals as happened to be at the time in their interest, or they could coerce. In consequence of these and other concurring causes, the power of the Scottish kings was circumscribed within the narrowest limits; the civil broils in which they were almost always engaged, were, in most instances, fomented and abetted by the government of England; and, a few short intervals excepted, the country was involved in continuous anarchy and confusion. (*See* the admirable introductory chapter to Robertson, and the Histories of Pinkerton, Tytler, &c., *passim*.)

The union of the crowns in 1603 introduced a great change for the better into the state of domestic affairs in Scotland. The barons could no longer look to England for open or underhand support in their contests with their sovereigns; while, at the same time, the power of the latter was vastly increased by their being able to employ the resources of a far more civilised, populous, and powerful monarchy in their disputes with their ancient subjects. Hence, though Scotland laboured under various grievances, resulting principally from the unreasonable hostility of the sovereigns to the Presbyterian form of church government, to which the great majority of the public were enthusiastically attached, she gained prodigiously in tranquillity and good order subsequently to 1603.

The union of the kingdoms in 1707 was, as it were, the necessary result and completion of the union of the crowns. Though excessively unpopular at the time, and opposed by many of the best Scotch patriots, it has been of vast advantage to Scotland, as well as to the empire generally.

The consequences of the rebellion of 1745 were also, notwithstanding the unnecessary and disgusting cruelty exhibited in its suppression, advantageous. It extinguished for ever the long-cherished hopes of the Jacobites; and it stimulated government to take effectual measures for abating the barbarism that prevailed in the Highlands, and for the introduction of a more efficient administration of justice into all parts of the country. In this view the old feudal hereditary jurisdictions were abolished, and sheriffs nominated and paid by the crown were appointed in their stead; and this most salutary measure being accompanied by the construction of military roads, that were carried into the remotest districts, the empire of the law was fully established; disorders of all sorts were promptly repressed; and at length the public energies were happily turned into those departments of industry and enterprise in which they have achieved such astonishing results.

SCUTARI (an. *Chrysopolis*), a town of Asiatic Turkey, being, however, in fact, a suburb of Constantinople, opposite the latter, on the other side of the Channel of Constantinople, on the Bithynian shore, about 14 m. E. Seraglio Point. Its pop. has been variously estimated at from 30,000 to 60,000. It is built on the declivity of several hills, and has a very picturesque appearance from the opposite shores: its interior is similar to that of the Turkish capital, and it is built in the same style: A palace of the sultan, with extensive gardens, barracks constructed by the late sultan Mahmoud, several handsome mosques, a noted college of howling dervishes, several large cemeteries, with public baths, bazaars, &c., are the principal edifices and public establishments. It is a rendezvous for the merchants and caravans from Armenia and Persia trading to Constantinople, and is the first station for the assembling of the Turkish troops in Asia.

Scutari is very ancient, and is said to owe its name of *Chrysopolis* to the circumstance of the treasury of the Persians having been established in it when they attempted the conquest of Greece. Its vicinity was memorable for the decisive victory obtained by Constantine the Great over his rival Licinius. (*Cramer's Asia Minor*, i. 191.; *Tournesfort, Clarke, Elliott, &c., passim*.)

SCUTARI, a fortified town of European Turkey, and the cap. of a pachalik in Albania, S. of the Lake Scutaro (an. *Labëris Palus*), at the confluence of the Bojana and Drinassi, about 16 m. from the embouchure of the former in the Gulf of Drino, in the Adriatic, 45 m. S.E. Cattaro. Its pop. has been estimated at 20,000. It has a pretty strong citadel, on an isolated rock; with various mosques, and Greek and Rom. Cath. churches. It stands on uneven ground, and is built in a very straggling manner. A rather active trade in timber is carried on by vessels which ascend the Bojana to the lake; the inhab. also manufacture cotton fabrics and arms, and build small-vessels. Scutari is supposed to occupy the site of the an. *Scodra*, the cap. of the Illyrian king Gentius; and which subsequently appears to have become a Roman colony. It is still a place of importance; and when Sir J. Hobhouse travelled in Albania, the power of its chief was the only counterpoise to that of Ali Pasha. (*Hobhouse's Albania*, 462; *Cramer's Anc. Greece*, i. 40, 41; *Horschmann*.)

SCYLLA and CHARYBDIS: The former is a famous rock and town of S. Italy, at the N. entrance to the narrow strait separating Italy from Sicily; and the latter is an equally famous whirlpool in the strait near the Sicilian coast. Scylla is a bold rocky headland, about 200 ft. in height, projecting into the sea, and hollowed at the base into caverns by the action of the waves. It is surmounted by a castle, in lat. 38° 14' 15" N., long. 15° 44' E. There is a sandy bay on each side the rock; and the town of Scylla, built principally on the steep acclivities of the ridge, stretches down to the shore on either side. It has about 5,000 inhab., said to be expert fishermen, seamen, and divers.

This little town suffered tremendously from the earthquake that devastated Calabria in 1783. A large portion of the inhab., with the prince at their head, fled to the beach, believing it to be least exposed to danger. But they had not been long there when an adjoining cliff fell into the sea; and the waves, driven back by its fall, rushed forward again with such tremendous fury as to rise high upon the shore, sweeping along with them in their recoil 2,173 persons, not one of whom escaped alive! (*Sicinarum*, ii. 419.)

The rock of Scylla is exactly 6,047 sq. yards, or nearly 3½ m. from the opposite point of Faro, at the N.E. extremity of Sicily. The whirlpool of Charybdis is not, however, opposite to Scylla, but within the strait outside the tongue of land enclosing the harbour of Messina. From its prominent position at the mouth of the straits, Scylla is exposed to the full action of the current, the sea making a loud noise in the caverns it has hollowed in the rock, which, of course, is much increased in storms. Charybdis seems to be formed by the main current passing through the straits from the N. being thrown over to the Sicilian shore by the point of Pezzo, and meeting the lateral current running in an opposite direction. It is from 70 to 90 fathoms deep, circling in quick eddies; and Captain Smyth says that small craft are sometimes endangered by it, and that he had seen a 74-gun ship "whirled round on its surface." (*Memoir of Scylla*, 123.) But, notwithstanding the action of the contrary currents, and the formidable appearance of Charybdis, there is no longer any real danger in navigating the straits, provided due caution be exercised. Although, however, it be quite obvious that Homer, in depicting the terrific dangers encountered by Ulysses in this famous strait (see *Pope's Odyssey*, lib. xxi. lin. 87, &c.), has made a very liberal use of the license allowed to a poet, still it is abundantly certain that it must have been much more dangerous in antiquity than at present. It was a generally received opinion among the ancients that Italy and Sicily were once united, and that they had been torn asunder by some great convulsion of nature. Pliny says, "*Scyllia, quondam Brutio agro coherens, mox interfusa mari amisa*." (Lib. iii. cap. 8; see also *Silius Italicus*, lib. xiv. lin. 2; *Virgil*, &c.) But whether this were so or not, it is plain that the action of the current for a period of more than 3,000 years must have materially widened and deepened the strait, and worn down those rocky prominences that render such narrow channels peculiarly dangerous. The configuration of the strait has also, no doubt, been materially altered in the interval by the earthquakes so prevalent in this region; so that we are by no means entitled to ascribe the statements of the ancients, in regard to its dangers, solely to their ignorance of navigation or their love of the marvellous.

Vessels in passing through the straits, in order to avoid coming within the vortex of Charybdis, sometimes run upon Scylla, which gave rise to the famous proverbial expression—"Incident in Scyllam cupiens vitare Charybdis;" applicable to those who, to avoid a less, run into a greater danger.

SEBASTIAN (ST.), a fortified frontier city and seaport of Spain, cap. prov. Gulpuscoa, in Biscay, at the extremity of a low sandy tongue of land, projecting into the Bay of Biscay, 10 m. W. by S. Fuenterrabia, and 40 m. E.N.E. Bilbao. Pop., according to Miñano, 9,720,

exclusive of its garrison; but, including this, and its suburbs, the pop. may be taken at 13,000. Having been in a great measure rebuilt since 1813, it is now one of the neatest and most regularly constructed towns in the peninsula, presenting a favourable contrast to most other Spanish cities. It is defended on the E. and W. by strong walls, washed by the sea; on the N. by the castle of Mota, on Mount Urgullo, a rugged cone near 400 ft. in height; and on the S. it is shut off by advanced military works, and by the little river Urumea, from its suburb of St. Catherine. The castle is well supplied with water, and is a fortress quite independent of the city, with which it communicates by two routes, both defended by various batteries. St. Sebastian has some handsome squares, several churches and convents, a civil and military hospital, &c.; its streets are clean, and it is abundantly supplied with water, though not of the best quality. The Urumea is crossed by a stone bridge of 8 arches. Though secure, and well defended, the harbour is dillicult of entrance; it is formed by a mole, and is of small size. St. Sebastian has always been a place of considerable trade, and was the seat of the Philippine Company. It is the port whence Buenos Ayres, Valparaiso, Logrono, &c. obtain most part of their supplies of colonial and other foreign goods; and at which the greater part of the French and English manufactures destined for Madrid, and other towns in the interior, are imported. Its exports are chiefly iron and wool. It had formerly some large cordage factories and tanneries, but these have mostly fallen into decay. It is the residence of a military governor, 2 justices, and the seat of a sub-delegation of police; a lottery department, a tribunal of commerce, &c. From its being, as it were, one of the keys of Spain, its possession has always been an object of great importance in the contests between the French and Spaniards. The former took it in 1719, 1794, and 1808; and held it from the last-mentioned epoch till 1813, when it was taken by the British forces under Sir Thomas Graham, now Lord Innesdoun. The latter were repulsed in their first attempt to carry it by storm in July; but they succeeded, though not without an enormous loss, in the second assault on the 31st of August. A fire having broken out in the town during the assault, it was all but destroyed. We regret to have to state that, notwithstanding every exertion on the part of the officers, the most horrible excesses were committed by the victorious soldiers. (*Miñano, Dic. de España*, &c.; *Napier's Peninsular War*, vi. 63—197.)

SEDAN, a fortified town of France, on its N.E. frontier, dép. Ardennes, cap. arrond., on the Meuse, 124 m. E.S.E. Mezières, lat. 49° 42' 29" N., long. 4° 57' 51" E. Pop., in 1836, ex. comm., 12,200. Though an important frontier town, the *Dic. Géog.* says that its works, some of which were constructed by Vauban, have latterly been neglected; and its citadel, at its S.E. extremity, has been converted into an arsenal. It stands on very uneven ground, and is separated into two unequal parts by the Meuse, here crossed by a stone bridge. It is well built; the streets, which are wide and clean, are ornamented with numerous fountains; the houses are mostly of stone, roofed with slate, and in the environs are various public walks.

Sedan has excellent cavalry and other barracks, a military hospital for 500 patients; other military establishments; a Calvinist, and several Rom. Catholic churches, a public library, communal college, a handsome theatre, &c. It is the seat of a tribunal of primary jurisdiction, a chamber of manufactures, &c. The water is said to have a tendency to produce *goutte*.

Sedan has been long celebrated for its woollen manufactures, consisting principally of fine black cloths, and cassimeres. In 1836-37, from 11,000 to 12,000 work-people were employed in the woollen manufactures of the town and its vicinity, of whom from 3,000 to 4,000 belonged to the town; from 2,000 to 2,500, belonging to the neighbouring villages, went to work daily within the town; and the remainder, consisting principally of weavers, inhabited the country for a distance of from three to four leagues round. The last, who also occupy small patches of land, work at the loom in their own cottages; whereas those who live in and near the town are mostly employed in large manufacturing establishments. In these, they work, nominally 10, and really from 14 to 15 hours a-day. But, notwithstanding these long hours, the work-people of Sedan are decidedly better fed, clothed, and lodged, than those of most other manufacturing towns of France: men get from about 2 to 3 fr. a day; women from 1 to 2 fr., and children from 10 sous to 1 fr. (*Villermé*, i. 264.)

The greatest harmony subsists between the work-people and the manufacturers. Drunkenness is comparatively rare, though in other respects their habits might be a good deal improved. Instruction is much more extensively diffused among the work-people than at Rheims, and, speaking generally, they have all the signs of good health; circumstances chiefly consequent on the non-introduction of children into the factories at

too early an age. Villermé farther adds, that their education and morals are both in a state of improvement. (*Tableau des Quartiers*, i. 253-279.)

Hosery, leather, arms, and hardware, are also produced at Sedan; and it has numerous dyeing-houses, with an extensive trade in drugs, &c. Previously to the Revolution Sedan was the cap. of a principality, which had often changed hands in the middle ages, but which was finally exchanged with Louis XIV. for some other fiefs by the Turenne family. One of the greatest of the French generals, the famous Marshal Turenne, was a native of this town, in the citadel of which he first saw the light on the 16th of September, 1611. His statue, in bronze, ornaments the principal square. (*Hugo*, art. *Ardenne*s; *Dict. Géog.*, &c.)

SEGORBE (an. *Segobrigar*), a city of Spain, cap. distr. of its own name in Valencia, near the Palancia, 18 m. N.W. Murviedro. Pop., between 5,000 and 7,000. Streets wide, and most of its houses well built: it has several squares, numerous public and private fountains, a cathedral in which are some good paintings, several convents, a prison, workhouse, and other public edifices. Its inhabitants are occupied in the manufacture of starch, earthenware, and paper, the distillation of brandy, and the quarrying marble in the vicinity. Two large fairs are annually held here. Various Roman antiquities have been found within the city. (*Mifano*; *Fisher's Picture of Valencia*, &c.)

SEGOVIA (an. *Secuvia*), a city of Spain, Old Castile, cap. of the prov. of its own name, 48 m. N.N.W. Madrid. Pop., according to Mifano, 12,880. It is built on two hills and the intervening valley, the unevenness of the site giving it a wild look. Most of the streets are crooked and dirty, the houses also are ill built, and chiefly of wood. The public buildings comprise 18 churches, including the cathedral, five hospitals, a mint, a college for cadets in the old castle or Alcazar, and military barracks. The cathedral, which is described by Swinburne as one of the handsomest churches in Spain, has a tower 330 ft. high, and exhibits a mixture of the Gothic and Arabian styles, nearly resembling that in the great church at Salamanca. The interior is characterised by a simplicity rarely seen in Spanish churches, the effect of which is infinitely superior to that of the gildings and ornaments elsewhere observable. The Alcazar is in great preservation, occupying a commanding situation on a rock rising above the open country. Towards the town is a large court before the great outward tower, formerly used as a prison, but now as a college of cadets. The rest of the buildings form an antique palace, once the favourite residence of Ferdinand and Isabella: it comprises several magnificent halls, with gilt ceilings; and along the cornice of the grand saloon are 52 wooden statues of the kings of Spain seated in state. The military college was remodelled on the formation of the present constitution, and the instruction given by the professors embraces most branches of knowledge connected with military science. The great glory of Segovia, however, is its aqueduct, supposed to have been built in the time of Trajan, and certainly one of the most perfect specimens of Roman architecture in Spain. Swinburne (ii. 248.) says, that "it is not only an admirable monument for its solidity and good masonry, which have withstood the violence of barbarians and the inclemencies of the seasons during so many ages, but is wonderfully beautiful and light in its design. It consists of 161 arches, in two ranges; that nearest the ground comprising 118, of which 43 are surmounted by an equal number of others: the whole is built of square stones, without mortar; and at the top is a channel, once hollow, but now filled up, only 8 ft. wide, and without a parapet. The total length of the aqueduct is 750 yards, and its height in crossing the valley (measured close to the Plaza del Azoguejo, where two of the arches cross the street) is estimated by Twiss at 102 ft., though other travellers say only 94 or 95 ft. (*Comp. Twiss*, 82, with *Tayemshend*, ii. 115., and *Ingis*, i. 286.) Swinburne considers it superior in elegance even to the Pont du Gard, near Nîmes; but, in point of fact, the two differ remarkably; the latter having 3 instead of 2 rows of arches, and the extreme height being 143 ft.

The mint of Segovia, the most ancient in Spain, is situated at the bottom of the city, on the small river Eresma, the water of which turns its machinery; for many years, however, its operations have been confined to the collage of maravedis, quartans, and other copper pieces. Segovia is said to be a decayed city, and most books on Spain contain accounts of the former flourishing state of its woollen manufactures; but Capmany has shown that, if not wholly unfounded, these accounts are, at all events, very greatly exaggerated; and that, when most flourishing, the number of looms in Segovia did not exceed 300 (*Questiones Criticas*, p. 37.), which, perhaps, is about their present number. It also, produces paper, earthenware, and glass. A fair held here in June is much frequented. In the neighbourhood are mines of lead and copper, as well as quarries of black marble.

The early history of Segovia is somewhat obscure; but, like most other cities of Castile, it belonged successively to the Romans, Goths, and Moors, from the last of whom it was taken at the beginning of the 15th century. During the Peninsular war the town was occupied by the French from 1808 to 1814. (*Townsend*, ii. 136-134; *Ingis*, i. 284-287.; *Mifano*.)

SEINE, the smallest, but most populous, wealthy, and important dép. of France, being that in which the capital is situated. It extends between lat. 48° 43' and 49° 58' N., and long. 2° 10' and 2° 35' E., being entirely surrounded by the dép. Seine-et-Oise. It is of a nearly circular shape, about 15 m. in diameter. Area, 47,548 hectares. Pop., in 1836, 1,106,801. The Seine traverses this dép. in its centre, with a general direction from N.W. to S.E., and receives the Marne within its limits. There are a few hills, but none of much elevation. Mont-Valerien does not rise to 450 ft. above the level of the Seine, and Montmartre is only 344 ft. in height. The soil is chiefly calcareous, this dép. forming the centre of the remarkable tertiary region called the Paris-basin. (*See PARIS*, ante, p. 466., and *FRANCE*, vol. i. 850.) But the chalk is covered with a bed of vegetable mould of considerable thickness; and the manure supplied by the capital renders the dep. very productive. The arable lands are estimated at 29,295 hectares; meadows, 1,543 ditto; vineyards, 2,784 ditto; and orchards, gardens, &c., 3,502 ditto. Corn is not extensively raised, and the little that is produced is but indifferent. It furnishes very superior peaches, and other fruits; and there are numerous market gardens for kitchen vegetables, &c. A good many cattle, and other live stock, are fattened for the Paris markets, and there are some flocks of superior sheep. In 1835, of 66,997 properties subject to the *contrib. foncière*, 17,272 were assessed at less than 5 fr.; while 12,522 were rated at from 100 to 330 fr., and 2,006 at 1,000 fr. and upwards. The manufacturing industry centres in Paris, which see. It is divided into 3 arrondis., and sends 14 mems. to the Ch. of Dep. Registered electors, in 1838-39, 16,871. Total public rev., in 1831, 95,592,188 fr.; expenditure, 15,843,551 fr. (*Hugo*, art. *Seine*, &c.)

SEINE (an. *Sequana*), a river of France; and though by no means the largest, yet one of the most important in the kingdom, being that on which the capital is built. It rises in the dép. and mountain-chain of the Côte d'Or (by which it is separated from the basin of the Loire), about lat. 47° 30' N., long. 5° E., 20 m. N.W. Dijon. It flows generally in a N.W. direction, between the basins of the Loire on the S.W., and of the Meuse and Somme on the N.E., through the dép.s of Aube, Seine-et-Marne, Seine-et-Oise, Seine, Eure, and Seine-Inférieure, to the British Channel, which it enters by a wide estuary at Havre, about lat. 49° 30' N., and long. 0° 10' E., nearly opposite Newhaven in Sussex. Its entire course, in consequence of its numerous windings, is estimated at 500 m., for nearly 350 of which it is navigable. Its source is about 1,420 ft. above the level of the sea. But more than 3-4ths of its descent takes place within the first 100 m. of its course, for at Troyes it is not more than 440 ft. above the sea; and at Paris its mean elevation above the latter is only 51 ft., and at Rouen 26 ft. (*Brunquiere*, *Orographie*.) From its not rising in mountains of any great elevation, it is neither subject to serious inundations, nor has it a rapid current; and the latter circumstance, together with its gentle rate of descent in the lower parts of its course, renders it highly suitable for navigation. The chief obstacles to its utility are the shifting sand-banks in its estuary, and some shallows between Quillebeuf and Rouen. At Paris the Seine is from 300 to 500 ft. in width; at its mouth it is 7 m. in width. It is here subject at the return of every tide to a phenomenon termed the *barra*, similar to the *nascaret* in the Dordogne, the *bore* in the Solway Frith, Ganges, &c. This consists of a wave of great magnitude, with an almost perpendicular front, impelled inwards from the sea with much violence as high as Jumèges, and sometimes even as far as Rouen. It gives notice of its approach by a noise which, according to Hugo, is heard for forty minutes beforehand, but it is, notwithstanding, frequently productive of damage to shipping. The tide in the Seine is usually perceptible as high as Rouen, to which city the river is navigable for vessels of 200 tons. Respecting the trade of the Seine, see the articles HAVRE and PARIS.

The Seine receives several considerable tributaries; as the Aube, Marne, and Oise, from the N.E., and the Yonne, Eure, and Risle, from the S. and W. Besides Paris, several large and flourishing commercial cities and towns are seated on the Seine; as Rouen, Elbeuf, Troyes, Melun, and Montargan, with Chatillon, Bar, Nogent, Corbeil, St. Germain, and Honfleur; and at its mouth is Havre, which, Marseilles excepted, is the first commercial port of France.

The Seine and its tributaries are connected by the canals of Briare, Orleans, and Nivernais, with the Loire; by that of St. Quentin with the Somme and Scheldt; by that of Ardenne with the Meuse, and by that of Bur-

gundy with the Loire. The canal of Ourcq (see Paris, p. 472.) also communicates with it. The banks of the Seine below Paris have been much praised for their beauty. "I reached," says Mr. Maclean, "Rouen by the diligence from Paris in 11½ hours. The road passes along the valley of the Seine, which is extremely beautiful, but deficient in variety. It is from 2 to 10 m. in breadth, and is bounded on both sides, not by hills, but by *plateaux*, or table-lands, of a very uniform elevation. The lands are carefully cultivated, but enclosures are rare, and the cottages small and mean. I went from Rouen to Havre by the steamboat in eight hours." (*Notes in France and Italy*, pp. 195, 196.)

SEINE-INFÉRIEURE, a maritime *dép.* of France, reg. N., formerly comprised for the most part in the prov. of Normandy, having E. the *deps.* Somme and Oise, S. Eure and Calvados, and W. and N. the British Channel. Area, 602,912 hectares. Pop., in 1836, 693,683. The S. boundary consists mostly of the Seine and its estuaries. There are some hill chains, but none of much consequence. Coasts in general abrupt, presenting a succession of calcareous cliffs. Climate moist, and colder than on the opposite coast of England. Soil generally calcareous or sandy; but in the arronds. of Havre and Yvetot there are some very fertile tracts, consisting of a fine light clay. In 1834, the surface is said to have been distributed as follows: viz.: 378,016 hectares arable, 28,021 do. meadows, 61,173 do. orchards and gardens, and 68,844 do. woods. Agriculture is more advanced in this than in most other *deps.* Ploughs of a superior kind have lately been introduced; the efficiency of manures is well understood; and fallows have been to a considerable extent superseded by the introduction of an improved rotation. Near Havre, on the large farms only, a few acres are in fallow: of the arable land, about one third part may be in wheat; one third in oats, barley, and rye; one sixth in clover; one twelfth in peas and vetches, and one twelfth in flax; and these are about the proportions throughout most part of the *dép.* In 1835, of 134,071 properties subject to the *contrib. foncière*, 29,516 were assessed at less than 5 fr., while 413 were assessed at from 300 to 500 fr., 1,522 at from 500 to 1,000 fr., and 754 at 1,000 fr. and upwards; so that the proportion of large properties is greater in this than in any other *dép.* of France; and to this its superior agriculture is, in a great measure, to be ascribed. The large proprietors seldom or never farm their own lands. Some farms run from 200 to 300 acres, but in general they are much smaller: they are almost always let for a term of 9 years, at a rent varying from 30s. to 50s. per hectare, which is always paid in money. According to the official tables, 5,313,000 hectolitres of corn were harvested in 1835, exclusive of 582,000 hect. potatoes, the cultivation of which is increasing on the small farms. A good deal of cider is made, and most of the peasants' cottages are surrounded by small orchards. Cattle, horses, and sheep are all of good breeds, and are, in fact, among the best in France: the produce of wool is estimated at about 650,000 kilos. a year. Wages are high. Farm servants always live with their masters; and ploughmen receive from 8*l.* to 12*l.* sterling a year; women from 3*l.* to 6*l.*, generally in money. Their food consists of bread, vegetables of all kinds, soup, eggs, cheese, &c., with cider for drink; and butchers' meat once or twice a week. The occupiers of farms are prosperous, though not rich. The farmer pays the land, house, window, and personal taxes, and is frequently called on for the support of paupers. The latter are numerous, and as no legal provision is made for them, they are wholly dependent upon voluntary contributions. (*Part. Rep. on Agriculture*, 1834.) This *dép.*, which ranks third in France with respect to pop., is inferior to none in manufacturing industry. Rouen (which see) is at the head of the cotton manufacturing towns; and Elbeuf is one of the chief seats of the French woollen manufacture. Manufactures of most other descriptions are carried on; and the *dép.* has, through Havre, &c., a most extensive trade with England, America, and most parts of the world; and by the Seine, with Paris and the interior of France. It is divided into 5 arronds; chief towns, Rouen, the cap., Dieppe, Havre, Neufchâtel, and Yvetot. It sends 11 mems. to the Ch. of Dep. Registered electors, in 1838-39, 7,599. Total public revenue (1831), 60,179,981 fr.; expenditure, 15,185,772 fr. (*Hugo, art. Seine Inf.*; *French Official Tables*, &c.)

SEINE-ET-MARNE, a *dép.* of France, reg. N., mostly between the 48th and 49th deg. of N. lat., and long. 2° 30' and 3° 30' E.; having N. the *deps.* Oise and Aisne; E. Aube and Marne; S. Yonne and Loiret; and W. the last-named and Seine-et-Oise. Area, 653,492 hectares. Pop., in 1836, 323,833. Surface, undulating; its slope being from E. to W. The highest hills are in the S. The Seine, here joined by the Yonne, traverses the S., and the Marne the N. part of the *dép.* The Ourcq, Loing, and Grand Morin are the other principal rivers. The geological formations are mostly calcareous, overlain in many parts by a deep layer of vegetable soil. This, indeed, is one of the finest agricultural *deps.* in

France, and has a good deal of rich land. In 1834, it was said to comprise 367,824 hectares arable land, 33,293 ditto meadows, 18,972 ditto vineyards, 6,607 ditto orchards and gardens, and 79,862 ditto woods. It has a large surplus of corn, principally wheat and oats, for exportation. Potatoes are, also, pretty extensively grown. The produce of wine may amount to nearly 600,000 hectols.; but it is mostly of low quality, and is principally used for home-consumption only. Cider is also produced.

In 1819, according to Mr. Jacob, this *dép.* was better cultivated than those more to the E.; the soil is well adapted for turnips, small patches of which are occasionally met with.

Meaux is finely situated in the midst of rich natural pastures, which fatten great numbers of cattle, and the dairy husbandry is also carried on to some extent. The breed of sheep has been much improved by crossing with the Merino breed, and the total annual produce of wool is estimated at 1,200,000 kilos. Wax and honey are important articles. In 1835, of 172,606 properties subject to the *contrib. foncière*, 85,862 were assessed at less than 5 fr., 26,280 at from 5 to 10 fr., and 709 at 1,000 fr. and upwards. No mines are wrought, but a good many hands are employed in quarrying paving and other stone. Manufactures, principally of cotton and linen fabrics, hardware and cutlery, earthenware, leather, and paper. This *dép.* is divided into 5 arronds: chief towns, Melun, the cap., Coulommiers, Fontainebleau, Meaux, and Provins. It sends 5 mems. to the Ch. of Dep. Registered electors, in 1838-39, 2,781. Total public revenue, in 1831, 12,888,751 fr.; expenditure, 7,577,351 fr. (*Hugo, art. Seine-et-Marne*; *Jacob's Tour*, &c., pp. 442, 443.)

SEINE-ET-LOIRE (formerly *Isle-de-France*), a *dép.* of France, reg. N., principally between lat. 48° and 49° N., and long. 1° 30' and 2° 30' E.; having N. the *dép.* of Oise, E. Seine-et-Marne, S. Loiret, W. Eure and Eure-et-Loire; it encloses the metropolitan *dép.* of the Seine. Area, 560,537 hectares. Pop., in 1836, 448,180. It has no hill 400 ft. in height. The Seine traverses this *dép.* from N.W. to S.E., receiving the Oise and Essonne within its limits; it belongs to the great tertiary basin of Paris, the soil of the *dép.* is principally calcareous; a large portion, however, is sandy; and it is not particularly fertile, except in the neighborhood of Paris, where it is liberally manured. In 1834, according to the official returns, the arable lands comprised 367,741 hect.; meadows, 20,691 do.; vineyards, 16,711 do.; orchards, 7,660 do.; and woods 77,213 do. Principal crop, oats and wheat. The annual produce of wine is estimated at about 700,000 hectol., but it is of very indifferent quality: cyder is also produced, to the extent of about 100,000 hect. a year. The culture of figs, cherries, strawberries, and other fruits and vegetables for the Paris markets, is an important branch of industry. A good many sheep are bred, and cows for their milk, which is sent to Paris; but few other kinds of live stock are reared.

In 1835, of 217,344 properties subject to the *contrib. foncière*, 104,305 were assessed at less than 5 fr., and 508 at 1,000 fr. and upwards. The proximity of Paris has given rise to a great variety of manufactures. Yarn and stuffs of all kinds, paper, hair fabrics, leather, earthenware, beet-root sugar, chemical products, &c., are among the principal goods manufactured. The *dép.* has a very extensive general trade. It is divided into 6 arronds; chief towns, Versailles, the cap., Mantes, Pontoise, Rambouillet, Etampes, and Corbeil. It sends 7 mems. to the Ch. of Dep. Registered electors, in 1838-39, 3,400. Total public revenue, in 1831, 23,036,434 fr.; expenditure, 12,803,713 fr. (*Hugo*; *French Official Tables*, &c.)

SELBY, a market town, river port, and par. of England, W. Riding, co. York, chiefly in Barkston and wapentake, on the Ouse, 11 m. S. by E. York. Area of par. 3,180 acres. Pop., in 1831, 4,600. The town is pretty well built, paved, and lighted, and has lately been much improved. A handsome Gothic market-cross, the par. church, and the town hall, a neat brick edifice built in 1825, are the principal public buildings. The church is a portion (almost the only one remaining) of Selby Abbey, founded by William the Conqueror in 1069, in which Henry I. was born. It is a large and magnificent cross church, of mixed Norman and early English architecture. The choir is a most beautiful specimen of decorated work; the E. end is peculiarly fine, with very beautiful windows, and octagonal turrets, having rich pinnacles. It has some very superior stone screen-work, and ancient stained glass. (*Rickman's Gothic Architect.*) The living, worth 97*l.* a year, is a perpetual curacy, in the diocese of York, in private patronage. Selby has meeting-houses for Friends, Independents, Calvinists, Wesleyans, Unitarians, and Rom. Catholics; a grammar-school founded by Edward VI., a hospital for seven poor widows, &c. The Ouse, which is here crossed by a movable timber bridge, is navigable to Selby for vessels of considerable burden; and it carries on an extensive intercourse by water

with Goole and Hull. It is also connected by railways with Hull and Leeds; and a branch custom-house being established here, it has become a considerable *entrepôt*. It has also manufactures of sailcloth, leather, and iron goods, and slips for building river craft. Petty sessions for the wapentake are held here, and courts leet and baron twice a year by the lord of the manor. Market day, Monday; fairs, Easter Tuesday, Monday after June 22, and Oct. 10, for cattle, wool, linen, tin and copper wares, &c.

SELKIRK, an inland co. of Scotland, being one of the smallest, and the least populous in that part of the United Kingdom; having N. Mid-Lothian, E. Roxburgh, S. Dumfries, and W. Peebles. Area, 169,280 acres, of which not more than 1-10th is supposed to be arable. This co. is, in most respects, similar to that of Peebles, and the statements as to the one will apply, with little modification, to the other. The greater part of the surface is mountainous; but the hills are green and smooth to the summits, and afford excellent sheep pasture. The co. is watered by the Tweed, and its two tributaries, the Ettrick and Yarrow: there is some excellent arable land in the valleys traversed by these rivers, but the extent is inconsiderable.

Selkirk has fully participated in the wonderful improvements that have been made during the last half century in most parts of Scotland. Its agriculture, breeds of cattle and sheep (now wholly Cheviot), roads, buildings, food and clothes of the inhabitants, &c., have all been signally improved. Average rent of land, in 1810, 4s. 8d. an acre. The woollen manufacture is carried on with spirit and success at Galashiels. The co. sends 1 mem. to the H. of C. Registered electors, in 1839-40, 612. Selkirk is divided into seven parishes, and had, in 1841, 1,446 inhabited houses, and 7,989 inhabitants, of whom 3,972 were males, and 4,017 females. Valued rent, 80,308*l.* Scotch. Annual value of real property assessed in 1815, 43,584*l.*

SELKIRK, a market town and royal bor. of Scotland, cap. of the above co., on the W. side of a range of mountains, about 14 m. from the right bank of the Ettrick, and 33 m. S.E. by S. Edinburgh, on the road leading from the latter to Carlisle. Pop., in 1841, 1,800. It consists chiefly of one wide, irregular street, which, at the market-place, expands into a triangular open space. The only public buildings are the town-hall, with a spire 110 ft. in height; a gaol, the parish church, and a chapel belonging to the United Associate Synod. Besides schools, it has a mechanics' institute, three subscription libraries, and a reading-room. Mungo Park, the African traveller, was born within a mile of the town, and a monument is at present (1841) about to be erected to his memory. Abbotford, the seat of Sir Walter Scott, on the right bank of the Tweed, is within 4 m. The town has no manufactures; but on the neighbouring banks of the Ettrick are woollen-mills, for the making of hosiery, tweeds, blankets, and similar stuffs. In remote times Selkirk was distinguished for its manufacture of shoes: hence the expression "souters (shoemakers) of Selkirk" was, and still is, used as denoting the whole inhabitants. But shoe-making is not now carried on to any considerable extent. Poor-rates were introduced in 1751: the present annual assessment is about 300*l.*

Selkirk was in ancient times a royal residence; *The Forest*, as the co. was once called, being a favourite hunting scene of the Scotch monarchs. Its history is intimately connected with the border wars. A standard, taken from the English at the battle of Flodden, by the "souters of Selkirk," is still preserved. The battle of Philiphaugh (1645), in which the Marquis of Montrose was signally defeated by General Leven, was fought within 14 m. of the town. Since the *Reform Act*, the bor. electors have been added to those of the co. (*New Stat. Acc. of Scotland, & Selkirkshire*, 1-10; and *Jeffrey's Guide to the Borders*.)

SEMLIN, a frontier town of the Austrian empire, in Slavonia, on the Danube, 3 m. N.W. Belgrade, and 40 m. S.E. by E. Peterwardein. Pop. about 9,200; a motley collection of Slavonians, Germans, Greeks, Servians, Croats, Gypsies, Jews, &c. It consists of an inner town and a suburb: it is not fortified, but only surrounded with a stockade. It has some good houses and churches, but its streets are mostly unpaved, mean, and dirty. At its N. extremity is the ruined castle of the famous John Huniades: it stands on a commanding height, having on its sides the huts of the Gypsy quarter. Semlin has a large quarantine establishment, at which travellers entering from Turkey are usually detained for from 10 to 40 days. The hospital, a high (female school), and a German theatre, are the other principal public establishments in the town, which is the residence of a Greek *protopapas*, and the chief *entrepôt* of the trade between Austria and Turkey. Its principal imports from the latter are raw cotton and cotton twist, honey, saffron, hare and rabbit skins, pipe-bowls, &c.: its exports thence woollen stuffs, earthen and glass wares, and other manu-

factured goods. (*Ocsterr. Nat. Encyc.*; *Berghaus, Burgess, Quin*, &c.)

SEMPACH, a small town of Switzerland, canton Lucerne, on the E. bank of the lake of same name, 7 m. N.W. Lucerne, famous in Swiss history for the victory gained in its vicinity on the 9th of July, 1386, by a Swiss force of about 1,400 men, over 4,000 Austrians, commanded by the archduke Leopold II. The Swiss historians ascribe their success in this battle to the patriotism and devotion of a knight of Unterwalden, who, grasping a number of the spears of the Austrian pikemen in his hands, showed his countrymen, at the expense of his own life, how they might make their way into the enemy's phalanx. But, whatever truth there may be in this story, we believe that the easy and complete victory of the Swiss was principally owing to the less poetical fact of the archduke having been killed at the beginning of the action, and to the panic his death produced in his army. Besides the duke, about 2,900 Austrian troops fell in the battle and pursuit; while the loss of the Swiss is said not to have exceeded 200 men. (*L'Art de Vérifier les Dates, Partie Moderne*, xvii. 95. 8vo. ed.)

SENAAR. See NUBIA.

SENEFFE, a village of Belgium, prov. Hainault, 6 m. S.W. Nivelles, famous for its vicinity, having been the scene of one of the most sanguinary conflicts of modern times. Here on the 11th of August, 1674, a French army, under the famous Prince of Condé, attacked the rear guard of the Confederates, commanded by the Prince of Orange, afterwards William III., and gained a considerable advantage. But, not satisfied with this, Condé imprudently attacked the main body of the Confederates, who had taken up a very strong position; on which, notwithstanding the most astonishing efforts, he could make no impression. The loss on both sides was nearly equal; and such was the slaughter, that above 20,000 men were left on the field of battle. In fact, to use the words of Voltaire, "*La grande et célèbre bataille de Senef ne fut qu'un carnage.*" (Siècle de Louis XIV., cap. 12.) Both armies withdrew next day, neither attempting to molest the other. This was the last great battle fought by the Prince of Condé. A well-known *bon mot*, ascribed to the prince in reference to this conflict, is of very doubtful authenticity.

SENEGAL, a large river of W. Africa, which, till the time of Delisle and D'Anville, was considered identical with the Niger of the ancients, but which is now ascertained to be wholly unconnected either with the Quorra, generally supposed to be the Niger, or with the Nilotic system of the African continent. Its sources have not been explored; but Mungo Park ascertained that they were separated from the basin of the Niger and Quorra by the Mandingo Terrace. The Ba-fing (black-water), regarded as the main stream, rises in this mountain region, in about lat. 10° N. and long. 11° W. Its course is generally N.W. to near lat. 16° and long. 17°, when it turns W., and falls into the Atlantic a little below the French settlement of St. Louis, after a course estimated at 1,000 m. Its chief affluents are, the Kokoro on the right, and the Falemé on the left, both of which join it in the upper half of its course. Timbo stands near the head of the Ba-fing: on its banks are the French forts of Faf, Dagana, Podhor, Bakel, St. Joseph, and Missala. The early course of this river and its tributaries is through a broken country, diversified by rugged and precipitous hills, and intersected by numerous streams, the sands of which are copiously impregnated with gold dust. At Fellou, from 400 to 450 m. from the sea, it forms a cataract, up to which it is navigable all the year for flat-bottomed boats. After passing Galam, the Senegal rolls over a level plain, with a very gentle descent, and after passing Podhor, a French station about 60 leagues from its mouth, the level is so complete, that Adamson does not conceive the total fall of the river from that station to the sea to be more than 24 ft. The tide is perceptible in the river for upwards of 60 leagues inland. The Senegal, in this part of its course, is bordered by vast forests, obstructed by thick underwood, and filled with numberless species of wild beasts and birds. At about 35 m. (direct distance) from the ocean, the Senegal divides into two arms, which enclose a delta. The principal or E. arm is deep enough to be navigable for the largest ships, but is obstructed by a bar at its mouth, which cannot be crossed, except during the inundations, by ships drawing more than from 10 to 12 ft. of water. Vessels under this draught may, however, always navigate the river as far as Podhor; and in the rainy season vessels of from 130 to 150 tons ascend to Galam. Like the Nile, the Senegal annually overflows and fertilises the adjacent country; and in July, when the inundation begins, some French vessels sail up as far as the river is navigable, trading with the natives for gum and other products. A fair, lasting fifteen days, is held annually at Fort St. Joseph. After this, as soon as the waters begin to subside, the vessels return, spending only about a fortnight in the downward journey, but consuming nearly three months in their upward voyage.

The Senegal forms a part of the line of demarcation between two regions widely differing in every respect. To the N., within a few miles of its banks, is the great desert of Sahara, with here and there a few Moors; while to the S. are the fertile regions of Nigritia, inhabited by negroes. (*Ritter's Africa*, Fr. trans., ii. 20-27.; *Hugo*, art. *Senegal*; *Dict. Géog.*, &c.)

SENEGAL, a name derived from the above river, given to some small French colonial establishments on the W. coast of Africa, comprising several islands, and small portions of the African continent, between the Senegal and Gambia rivers. It is divided into two arronds., the N. consisting of the isles of St. Louis, Bavière, Safal, and Gheber, near the mouth of the Senegal, with some few establishments on the banks of that river, and trading stations along the coast between Capes de Verd and Blanco; and the S. arrond., comprising the island of Goree, Alibreda, on the bank of the Gambia, and the other stations S. of Cape de Verd. The total pop. of these dependencies amounted, in 1836, to 18,040; of whom about 18,000 were Mohammedans and blacks; 2-3ths of the pop. inhabited St. Louis and its arronds.

This part of the African coast is nearly destitute of good harbours: those of St. Louis and Goree are the best. The soil of the isles and continental shore is sandy, but improves in quality further inland, where it is covered, S. of the Senegal, with dense forests, and the most luxuriant vegetation. The climate, though not so very pestiferous as that of Sierra Leone, is extremely bad. The heat of summer is most relaxing and oppressive, especially during E. winds, though the thermometer does not stand extremely high. The wet season, which lasts, with S. W. winds, from June till Oct., is particularly fatal to Europeans, who are attacked with dysenteries, liver complaints, and various kinds of fevers. The mineral products are few. There are traces of iron, but little ore is wrought. Basalt, &c., are found at Goree, but scarcely any stone elsewhere; and at St. Louis, the most solid buildings are only of brick. Gold is procured from the countries towards the head of the Senegal, but the efforts of the French to form settlements there have hitherto proved abortive. Near the mouth of the Senegal are some salt-pans, and in some parts of the interior natron effloresces on the soil. The vegetable products are the most varied and abundant. They include the gigantic baobab (*Adansonia digitata*), palms, mimosas, and gum trees of numerous kinds, Senegal ebony, and other valuable timber; with cotton, indigo, coffee, arbutto, olives, hemp, and other fibrous plants; cassia, sweet potatoes, millet, maize, &c. Among the wild animals are the elephant, lion, hippopotamus, wild boar, buffalo, tiger-cat, great numbers of deer, game of all species, and an immense variety of birds and reptiles. Oxen, buffaloes, horses, asses, &c., are used for domestic service, as in Europe; and goats, sheep, and hogs are reared. Several kinds of artificial grasses are grown, but the culture of products for food, or exportation, is pursued only to a very small extent, Senegal being a trading *entrepôt* rather than an agricultural colony. Few of the colonists are employed in manufactures, except in the working of iron, and ship-building. The making of bricks, lime, and salt, employs a few hands: the negroes weave such clothes as they require, but other manufactured articles are obtained from Europe. We subjoin an

ACCOUNT of the Quantities and Value of the principal Articles exported from the Senegal Colonies in 1836:—

Articles.	Quantities.	Value.
Raw hides - - - kilogr.	227,728	395,468 fr.
Wax - - - - -	45,134	90,268
Elephants' teeth - - -	12,248	85,823
Gum Senegal - - - -	1,791	2,242 1/2
Cabinet-woods - - -	40,569	11,178
Gold - - - - - grammes	50,225	150,675
Spice - - - - -	-	7,800

The total value of the exports, including that of goods re-exported, amounted to 4,051,263 fr.: the imports to 6,961,894 fr., the principal being linen and cotton fabrics, cloths and apparel, brandy, liqueurs, wines, and other provisions.

Senegal is governed by a superior naval officer, who resides at St. Louis: Goree is the seat of a lieutenant-governor. There appears to be neither a representative assembly, nor a colonial council. A court of primary jurisdiction sits at St. Louis; from the decisions of which, appeal lies to a court composed of the governor, the other chief functionaries, and certain principal inhabitants of the colony. The European force in Senegal consists of half a battalion of marines, a comp. of marine artillery, and a comp. of sappers, &c., altogether amounting to about 370 men. The French established themselves here in 1657, but no settlement of much importance was made till the formation of the Senegal Company in 1664. The English took Senegal in 1756, but it was re-

taken by the French in 1779: it was again held by the English from a period shortly after the French Revolution till the peace of 1814. (*Hugo*, art. *Senegal*; *États des Colonies Françaises*.)

SENLLIS (an. *Augustonemetus*, post *Sylvanectus*), a town of France, dép. Oise, cap. arrond., on the Nonette, a tributary of the Marne, 29 m. S.E. by E. Beauvais. Pop., in 1836, 5,016. It stands on the declivity of a hill, and consists of the town proper, and three suburbs. The town is surrounded with thick walls, parts of which are supposed to be remains of those constructed by the Romans. It is tolerably well built; but the streets are mostly narrow and crooked, and it has few public buildings worth notice. The cathedral, however, has a handsome spire, 225 ft. in height. Chicory, starch, and cotton thread, are the principal manufactures. The town was of importance in the middle ages: under the Carolingians it had the right of coinage; and in 1180, Philip Augustus espoused Elizabeth of Hainault at Senlis. (*Hugo*, art. *Oise*, &c.)

SENS (an. *Agedincum*, post *Senones*), a town of France, dép. Yonne, cap. arrond., on the Yonne, 30 m. S.E. Auxerre. Pop., in 1836, ex. com., 9,029. It is surrounded with decayed walls, attributed to the Romans, and various Roman antiquities exist in and round the town. It is said by some authorities, but not by others, to be well laid out and well built; and is kept clean by streamlets, which traverse its principal thoroughfares. It has a fine Gothic cathedral, of the same proportions as Notre Dame, in Paris, though of less size. In it is the splendid marble mausoleum of the dauphin, son of Louis XV., and father of Louis XVI., Louis XVIII., and Charles X., a *chef-d'œuvre* of Goussier. In the chapter-house is a painting of the death of Thomas à Becket, who took refuge at Sens about 1166. The communal college is a large building, with a museum of antiques, and a public library of above 6,000 vols. Sens has a seminary, some public baths, a handsome theatre, a court of primary jurisdiction, &c.; manufactures of serge, druggets, wax candles, and glue, with breweries and distilleries; and an active trade in agricultural produce, timber, oak bark, leather, bricks, &c. Under Valens it was made the cap. of the 4th Lyonnaise; and it became an archbishopric on the establishment of Christianity in the empire. Several councils were held here in the middle ages, including that in 1140, at which Abelard was condemned for heresy. (*Hugo*, art. *Yonne*; *Guide du Voyageur*, &c.)

SERAMPORE, one of the Danish settlements in Hindostan, prov. Bengal, consisting of a town on the Hooghly, about 12 m. above Calcutta, and immediately opposite Barrackpore. Pop. about 15,000. (*Malcom*.) It extends for 1 m. along the river, and is without fortifications, having only a small battery for saluting. "Serampore is a handsome place, kept beautifully clean, and looking more like a European town than Calcutta, or any of the neighbouring cantonments. Since the Copenhagen rupture (and more especially since it ceased to be an asylum for debtors from Calcutta), it has grievously declined, and its revenues scarcely meet the current expenses. Many persons of different nations, who like a cheaper residence than Calcutta, take houses here." (*Mal.*, *Trip.*, ix. 110.) It has long been the head quarters of the Protestant missions in India; and has a large and handsome college for the instruction of native youths, an extensive missionary printing establishment, &c. It was here that the Scriptures were translated into various Indian dialects, under the superintendence of Dr. Carey and others. (*Malcom's S. E. Asia*, ii. 46.; *Hamilton's E. I. Gaz.*)

SERES, a large town of Turkey in Europe, in Macedonia, cap. of a beylik; on a declivity a little N. of the lake Takhnos, and 44 m. N.E. Salonika. Its pop. is probably between 25,000 and 30,000; but this part of Europe is so seldom visited by travellers, that we have little accurate information respecting it. Seres is surrounded by a wall flanked with towers, and surrounded by a citadel. It is said to be well built, the houses being interspersed with gardens: it has some spacious *khanes*, numerous mosques, churches, and fountains, and several public baths; with linen and cotton manufactures, and an active trade in cotton, grown in large quantities in its vicinity. Stein states that 70,000 bales of cotton are annually exported from Seres, 30,000 of which go to Vienna. (*Horschemann's Stein*, &c.)

SERINGAPATAM (Sri-Ranga-Patana, "Vishnu's city"), a decayed town and fortress of India, S. of the Krishna, which, under Hyder Ali and Tipoo, was the capital of Mysore. It stands at the W. angle of an island in the Caverry, about 4 m. in length by 14 m. in breadth, and is about 250 m. W.S.W. Madras. Lat. 12° 25' N., long. 76° 48' E. The fortress, constructed by Tipoo, is an immense mass of building, but in several respects injudiciously planned. It was, however, when invested by our troops, strengthened with six redoubts, and other strong outworks. As a capital, the town was but mean. It has one good bazaar, and a broad road under

the ramparts, but the other streets have a very indifferent appearance; the houses, also, are shabby, and the public buildings few. Hamilton speaks of an arsenal, a gun-carriage manufactory, &c.; but it is probable that these, as well as the other military establishments, have been since removed to Mysore. On an eminence in the centre of the island is a large and handsome suburb, in which is the mausoleum of Hyder Ali and Tippoo; and across the Cavery, near the city, is a native bridge of granite, remarkable for its size and solidity.

Seringapatam was besieged by the English on three different occasions: the first two sieges took place in 1791 and 1792; at the latter, Tippoo purchased a peace by ceding half his dominions, and paying 3 crores and 30 lacs of rupees to the British and their allies. Another war, however, broke out in 1799; and on the 4th of May, in the same year, Seringapatam was stormed by the British and the Nizam's forces, under Gen. Harris. On that occasion Tippoo was killed, with the greater part of his garrison, amounting to 8,000 men, and the dominions of the last formidable enemy of the British in the Indian peninsula were added to our Indian empire. (*Mod. Trav.*, viii.; *Hamilton, E. I. Gazetteer*, &c.)

SERVAN (ST.), a town and sea-port of France, *dép.* Ille-et-Vilaine, on the Rance, immediately behind St. Malo, of which town it may be considered the continental suburb, though comprised in a distinct commune. Pop. in 1836, with comm., 9,548. St. Servan is well built, and has a good harbour for merchant vessels, divided into two parts by the *Solitor*, an isolated tower about 60 ft. in height. The dock-yard, which derives its name from this tower, has 5 slips, three of which are appropriated to the construction of frigates; and during the war many frigates were built here. The naval establishments at St. Servan are considerable; and a floating dock, to connect the port with that of St. Malo, is now (1811) in rapid progress towards completion. (*Porte, &c. of France*, 280, 291.) St. Servan has manufactures of sail-cloth, cordage, ship-biscuit, &c., and is the general *entrepôt* for the trade of St. Malo. Among its inhabs. are many English families, attracted thither by the cheapness of living, and the beauty of the neighbourhood. (*Guide du Voyageur*; *Hugo*; *Priv. Inf.*)

SERVIA (an. *Mæsia-Superior*, with part of *Illyricum*), one of the principalities on the Danube, nominally included in the dom. of Turkey-in-Europe, but in a great measure independent of the Porte. It extends between the 42d and 45th degs. of N. lat., and the 19th and 23d of E. long.; having N. the Hungarian provs. of Slavonia and the Banat, from which it is separated by the Save and Danube; E. Wallachia and Bulgaria, from the first of which it is also separated by the Danube; S. Macedonia, the Balkhan being the boundary line in this direction; and W. Bosnia, from which it is divided by the Ibar and the Drin. Greatest length, N. to S., about 180 m.; breadth, varying from 100 to 160 m. Area roughly estimated at 20,000 sq. m., and the pop. at about 1,000,000, mostly Christians of the Greek church. The greater part of the country is covered with mountains, those in the W. being ramifications of the Dinaric Alps, and in the S. and E. branches from the Balkhan. There are, however, some tolerably extensive plains, particularly in the N. and along the course of the Morava. This river, which, after those above named, is the principal in Servia, nearly traverses the country from S. to N. The climate is remarkably variable, and much colder in winter than would be inferred from the lat., the Danube and the Save being often thickly frozen over. The heats of summer are proportionally intense: the autumn is the most agreeable season; but ague is very prevalent then and in spring. The soil is almost everywhere fertile, though to a great extent uncultivated. Every species of grain common in Europe is reared, except rice. Maize is the principal, but much more wheat is produced than for merly, and maize bread is now generally made use of by the inhabs. of Belgrade and other large towns. Owing to the inland situation of the country, and the want of markets, the price of corn is usually very low.

The vine is pretty generally grown; but from defects of culture, the grapes of the same vineyard usually differ greatly in quality, and being all used promiscuously in the making of wine, it is, for the most part, very indifferent. In the district of Belgrade, however, superior red wine approaching to claret has been made, though to no great extent. In fact, but little wine is drunk in Servia; a spirituous liquor, distilled from plums, called *sitovitz* or *rakia*, sold at about 4d. a quart, being used in its stead. Hemp, flax, tobacco, and cotton are cultivated, but only in small quantities. The pasture-grounds are extensive and good, though little can be said in favour of the breeds of cattle and sheep. Both are meagre and impoverished; and the former, though universally employed, with buffaloes, for draught, are not very numerous. The horses, also, are poor and diminutive, though lately Prince Milosch has made considerable efforts to improve the breed. Hogs are by far the most valuable and favourite stock. No peasant's family is without these ani-

mals. They overspread the country in vast herds, being branded with the proprietor's name, and turned loose in the forests, where they feed on acorns, except in winter, when they are scantily fed at home on maize, and other dry provender. Hogs constitute the principal export from Servia: about 220,000 are said to be annually sent to the Austrian dominions, where they pay a considerable import duty, having also paid an export duty on leaving the Servian frontier. The wool of the Servian sheep is very inferior; but about 60,000 lamb and goat skins are annually disposed of to Austrian merchants.

The forests, which overspread a large proportion of the country, might, if they could be turned to good account, be made, under judicious management, an almost inexhaustible source of wealth. Oak, extremely well adapted for ship-building, ash, pine, &c. are the principal trees, and vallonea is produced in great plenty. But, as if the natural difficulties in the way of its exportation were not enough, government has prohibited the felling of oak timber! and the forests in many places are so thick as to be all but impassable, and are, at the same time, encumbered with putrescent vegetation. The collection of leeches, which abound in the marshy districts, has been carried to some extent of late years. They are disposed of to French merchants settled in Belgrade and Scutlin, who forward them by way of the Danube, &c. to Paris, which they reach in 12 or 14 days; but this, which promised to become a business of considerable importance, has been monopolised by government. Iron, copper, lead, quicksilver, and coal, are found in Servia; but few or no mines are wrought; partly from a want of capital and enterprise, but partly also, it is alleged, from a wish on the part of government to conceal such tempting sources of national wealth, to avoid exciting any desire in its neighbours to possess themselves of the principalities.

Until a more extensive commerce take place on the Danube, or a free communication of some kind be established between the Upper Save and the Austrian ports on the Adriatic, the great natural resources of Servia must continue all but unavailable. Her produce being similar to that of the S. provinces of Austria and Russia, those states throw obstacles in the way of her commerce; at the same time that the adjacent Turkish provinces have no need of her staples. The want of roads is, also, a great drawback on the prosperity of all the provinces in this remote part of Europe: the only high road in Servia is that which leads from Belgrade to Adrianople.

Servia, however, is less inconvenienced than most of the contiguous provinces by the want of roads, their deficiency being, in part at least, compensated by the easy access to the great navigable rivers by which she is almost surrounded. A more liberal and bolder commercial policy on the part of Austria would do much to develop the resources and advance the civilisation of the Servians; and by attaching them to her interest, it would seem, also, to be the safest in a political point of view.

The Servians belong to the widely-spread Slavonian stock, with which most part of E. Europe is peopled. Their language is the most refined of the Southern Slavonian dialects, and their poetry ranks high among that of the E. European nations. (*See Bowring's Specimens of the Popular Poetry of the Servians.*) In their manners and customs the Servians differ little from the other Slavonic tribes in their vicinity (*see Turkey*, &c.); they are in general almost equally uncivilised, backward in the arts, &c., ignorant and superstitious; though in some of the larger towns some degree of advance has of late been perceptible.

Servia is divided into 6 provs., and 13 districts; chief towns Belgrade, the cap., Seinenndria, Nissa, Jogodina, Kragajewacz, and Poschega. In the middle ages, it formed an indep. kingdom, the dominion of which extended over parts of Bulgaria, Bosnia, Albania, &c.; it was conquered by the Turks in 1365. The Turks still garrison Belgrade, which is the residence of a pacha; but nothing is left them beyond this military occupation, an acknowledgment of the supremacy of the Porte, and a small yearly tribute to the sultan. The internal government is wholly in the hands of the Servians. Early in the present century, a successful revolt took place, headed by Czerny-George, a native chief, who, in 1806, took Belgrade from the Turks, and continued to govern the country till the peace of 1814; when it again submitted to the Turks, and Czerny-George took refuge in Russia. A new revolt, under Milosch Obrenowitsch, in 1815, was equally successful, and Milosch has till lately held the reins of government. He established a representative assembly, a council of ministry, &c. In 1835, a general poll-tax, to meet the state expenses, and various other financial plans, were adopted. But whether it were owing, as has been alleged, to Russian influence, or to other circumstances, Milosch was obliged to resign the government, and retire to his estates in Wallachia in 1839, since which period he has been succeeded by his second son, Prince Michael. Servia has a small standing military force of about 1,750 men, 1,500

infantry, 200 cavalry, and 50 artillerymen; but all males capable of bearing arms are enrolled in the militia, and a force of 40,000 men may be collected on an emergency. (*Prin. Report on Serbia; Quin's Voyage on the Danube*, p. 225-234.; *Page's, Burgess, &c.*, passim.)

SETUBAL, or ST. UBE'S, a city and sea-port of Portugal, prov. Estremadura, cap. Comarca, on the N. side of the bay of its own name, which receives the Sadao at its S.E. extremity, about 18 m. S.E. Lisbon; lat. 38° 28' 54" N., long. 8° 53' 32" W. Pop., according to Mifano, 15,000. It extends for about 4 mile along the beach, consisting mostly of 2 or 3 parallel narrow streets, crossed by others, and some squares, in one of which is a handsome public fountain. It is enclosed by walls partly in ruins, and defended by the castle of St. Philip and a few other detached forts. It has several convents and hospitals, Latin schools, and courts of justice, broad quays, and a convenient harbour for merchantmen. Its environs, which are very picturesque and fertile, produce large quantities of muscadell, and white wines; which, with oranges, lemons, and salt, are its principal articles of export. The export of salt from St. Ubes have long been of very considerable importance; and furnish, indeed, the greater part of the demand of Sweden, and various other countries. Being preferable for certain purposes to the salt of this country, we import from 250,000 to 350,000 bushels a year. The pilchard fishery employs a good many hands, and a large fair is held annually from the 25th to the 29th of July. Near it is the famous convent of Arnabida, to which pilgrimages are performed. The an. *Celabrige* is supposed to have stood on the opposite shore of the bay, where various remains of antiquity have been found; one of which, a Corinthian pillar, surmounted by a crucifix, stands in the square of the city. After the expulsion of the Moors, Setubal was all but deserted, till it was reoccupied under Alonzo Henriquez and his son Sancho. It was fortified during the war of independence in the 17th century. (*Mifano*.) It suffered severely from the earthquake so disastrous to Lisbon in 1755. (*Dict. Geog.; Southey, &c.* in *Mod. Trav.*, xix.)

SEVASTOPOL, or AKTIAR, a town and sea-port of European Russia, on the W. coast of the Crimea, lat. 44° 36' N., long. 33° 30' E. Pop. fluctuating, consisting principally of the garrison, and of the various individuals connected with the fleet. Sevastopol stands on a creek, on the S. side of one of the finest bays in the world, the *Elenus* of Strabo. It stretches E. into the country about 5 m., with a breadth, where greatest, of about a mile; it has, till within a short distance of the bottom, near lukermar, from six to eight fathoms water. There are in the cove on which the town is built, five fathoms water close in shore. The bottom is clay and mud, and it is quite free from rocks and shoals. The bay is defended by strong forts on both sides the entrance. Merchantmen are excluded from Sevastopol, and it has become the principal station of the Russian fleet in the Black Sea, for which it is incomparably better fitted than either Kherzon or Nicolaeff. Streets wide and regular, intersecting each other at right angles; houses extremely good, and built in the modern Italian style; principal edifices, admiralty, arsenal, hospital, barracks of the garrison, marine barracks, &c. The calcareous rocks at Inkerman (town of caverns), in the vicinity of Sevastopol, have been cut into the most extraordinary caverns, or rather into chapels, monasteries, cells, &c., "which, by their multiplicity and intricacy, astonish and confound the beholder." (*Clark*, ii. 203.; see also p. 272., where there is a good plan of the bay of Sevastopol; *Lyall*, i. 290., &c.)

SEVENOAKS, a market-town, and par. of Kent, lathe Sutton-at-Hone, hund. Codhenth, on a ridge of hills near the Darent, and on the road from London to Rye, 21 m. S.E. London. Area of par., with the liberties of Riverhead and Weald, 6,790 acres. Pop., in 1841, 4,827. The town consists principally of two wide streets, in one of which is the market-house. Many of the houses are large, and inhabited by opulent families. The par. church is spacious and handsome, and is a conspicuous object for several miles round. The livings are a rectory and a vicarage in the gift of the Curteis family; the former worth 306*l.*, and the latter 629*l.* a year, nett; two curacies are established in the par., one at Riverhead, and the other at Weald Chapel; respectively worth 45*l.* and 100*l.* a year. There are meeting-houses for Baptists and Wesleyans, an hospital for aged persons, and a free grammar-school, both founded and endowed by Sir W. Sevenoke, in 1418. The latter was further endowed by Queen Elizabeth, whose name it bears; and it has now an annual income of about 1,000*l.*, with seven exhibitions, five of scholarships in any college of either university, and two in Jesus' College, Cambridge. In another school, founded in 1675, about 300 poor children are instructed on the national system. Near the town is Knowle or Knoll, the magnificent seat of the Dukes of Dorset; it is at present occupied by the Countess Amherst, but has belonged, with little inter-

mission, to the Sackville family, since the time of Elizabeth. It is a large, fine, castellated edifice. The interior, which is nobly furnished, has various pictures by celebrated masters, and other splendid works of art. Sevenoaks has no manufactures: there were formerly some silk mills in the vicinity, but they no longer exist. The town is governed by a warden, a bailiff, and four assistants, chosen at an annual court leet. Petty sessions are held at the Crown Hotel on the last Saturday in every month; and a court of requests is held on the first Friday in each month. Sevenoaks is the head of a par. union. Markets on Saturday; fairs, July 10, and Oct. 12., for hogs and poultry; and the 3d Tuesday in every month for cattle.

SEVERN, a river of England, being inferior only to the Thames in magnitude, and perhaps, also, in importance. It has its source in a small lake on the eastern side of Minlimmon Mountain, in Montgomeryshire. At its outlet it is called the Hafren, the name by which, through its whole course, it was known to the Britons. It flows first towards the S.E., and afterwards turns to the N.E., as it approaches Newton, where it takes the name of Severn. Hence, through the vale of Montgomery, its course is almost due N., till, entering the great plain of Salop, beyond Welshpool, it turns abruptly to the S.E.; and pursuing the same direction, it almost encircles Shrewsbury. Flowing through Colebrook Dale, and passing Bridgenorth, it follows a southerly course as it leaves Salop, and enters Worcestershire at Bewdley. Being now become a broad and deep river, crowded with barges, it rolls through a pleasant country in a tranquil stream, passing the city of Worcester, and traversing the Vales of Evesham and Gloucester. In the latter it divides into two channels, one of which washes the walls of Gloucester; but, being again united, it forms a great tidal river. Its course from Gloucester to Nass Point is tortuous: from the latter it flows S.W., till it assumes the name of the Bristol Channel, expanding and insensibly losing itself in the Atlantic Ocean.

The Severn, particularly below Gloucester, has frequently overflowed its banks, and occasioned much damage to the surrounding country. It is remarkable for its tide, which rushes in with a head 4 or 5 ft. high, and a loud noise. This, no doubt, arises from the wide expanse of the waters of the Atlantic in the Bristol Channel being gradually narrowed, till at length they are forced violently up the river. Outside the Bristol Channel, spring tides rise from 22 to 24 and 26 ft.; but in Klag's Road, at the mouth of the Lower Avon, they rise to the height of 48 ft., and sometimes more; and at Chesnow the rise is 60 ft. (*Norris's Sailing Directions for the Bristol Channel*, 20.) The opposition which the current from the sea meets with from the adverse current of the river occasions that dashing and grinding of the waves known by the name of *hyrc* or *cagyr*.

The Severn is navigable from Fatholm Lighthouse, where it loses itself in the Bristol Channel, to Welshpool, a distance of about 178 m.; and its navigation is continued by the Montgomery Canal to Newton. It is, consequently, of the highest importance as a channel of internal communication; its capacity in this respect being materially increased by its numerous large tributary streams, and by the canals and railroads that join it. By means of the latter, it commands a large share of the commerce of Birmingham, and of the various trading towns of Staffordshire, Warwickshire, &c., and is united with the Thames, the Trent, and the Mersey. From Welshpool to the sea it has a gradual fall of 225 ft. (*Priestley on Inland Navigation, &c.*, 536.)

The navigation of the Severn from Nass Point to Gloucester is both tedious and difficult. To obviate this inconvenience, a canal on a large scale has been dug from Berkeley Pill to Gloucester. It is 184 m. in length, from 70 to 90 ft. in width, and from 15 to 18 ft. in depth; and may consequently be navigated by vessels of 350 tons. There is a basin at each end for the accommodation of shipping. This canal, which was opened in 1827, has become the channel of an extensive commerce; and Gloucester is now rising fast in importance as a trading and shipping town. (*See Gloucester*.)

The barges which navigate the Severn are about 120 ft. in length, from 19 to 20 in breadth, and 5 in depth. They carry above 100 tons. The trows are from 60 to 70 ft. long, 20 broad, and 5 deep, carrying 75 tons. They carry a square-sail, and have a mainmast and topmast.

Of the tributaries of the Severn, the most important are the Tems, the Upper and Lower Avon, the Wye, and the Usk.

SEVERNDROOG, or SAVENDROOG, a strong hill fortress of Hindostan, in the Mysore territory, 20 m. W. by S. Bangalore. Though it be impossible to invest this place closely, it was, nevertheless, stormed and taken without the loss of a single man, by the British, under Lord Cornwallis, in 1791.

SEVILLE, a celebrated city of Spain, famous "for oranges and women" (*Byron*), the cap. of Andalus, and of the prov. of its own name, in a wide and fruitful

plain on the Guadalquivir crossed here by a bridge of boats, 62 m. N.E. Cadiz, and 212 m. S.S.W. Madrid. Lat. 37° 23' 50" N., long. 5° 47' 47" W. Pop., acc. to Miliano, 91,360. It has numerous suburbs, but the city proper is about 4 m. in circuit; enclosed by a line of circumvallation 13 m. in circ. The ancient suburb of Triana is on the right bank; but with this exception, Seville lies wholly on the E. side of the river. "The streets, with a few exceptions, are narrow and crooked, some of them being so contracted that one may touch both walls at the same time. Few are wide enough for carriages; and many through which coaches pass, show, by the deep furrows in the walls, that one once touched, and often both at the same time." (*Townsend's Spain*, ii. 315.) The street or place, called the Alameda, in the centre of the town, planted with elm trees, is, however, very magnificent; being 600 yards in length, by 150 in width, decorated with 3 fountains, and with statues of Hercules and Julius Caesar. And since Mr. Townsend's time various improvements have been introduced; old streets have been repaved, obstructions and irregularities removed, and numerous modern wide streets built in straight lines with regular and handsome houses. On the whole, however, Seville has all the peculiarities of a Moorish town, and furnishes a good specimen of the architecture of the Moors in the streets and houses, the former of which, narrow, close, and dirty, appear in strange contrast with the extensive and airy mansions that open on them, neatly white-washed, and studded with numerous windows, each having its cool-looking, green Venetian shutters. The *Pasco* and the *Delicias* are the principal public walks, and perhaps in point of rural beauty are superior to any in Spain. The former is here what the *Prado* is in Madrid; and in it the pop. may be studied to the best advantage. Among the public buildings are 31 churches, including the cathedral, numerous large edifices formerly conventual, but many of which have lately been turned into manufactories; an exchange, guildhall, 10 hospitals, one of which is military, an asylum for decayed priests, 8 sets of barracks, 7 prisons, and 2 theatres.

The cathedral, built in the 14th and 15th centuries, occupies the site of a Moorish mosque; but it seems highly probable that it was a Christian church prior to the Mohammedan conquest. It has 5 naves, but no dome or central tower. It is, according to Townsend, 420 ft. in length by 263 ft. in breadth; the height from the floor to the roof being estimated at 126 ft. "The cathedral," says Mr. Swinburne, "is more cried up than I think it deserves; it is by no means equal to Yorkminster for lightness, elegance, and Gothic delicacy. The clustered pillars are too thick, the aisles too narrow, and the choir, by being placed in the centre, spoils the whole *coup d'œil*, and renders the rest of the church little better than a heap of long passages. The ornamental parts are but clumsy imitations of the models left by the Moors. Not one of the great entrances or porches is finished; and to disfigure the whole pile, a long range of buildings in the modern style has been added to the old part." (ii. 23.) The only remaining parts of the mosque are the Giralda, or belfry, and the great gate of the cloisters, the latter of which is a fine specimen of the best style of Moorish architecture.

The most admired feature in the whole cathedral, however, is the *Giralda* (weathercock), a brick tower 258 ft. in height, and exactly square, each side being 50 ft. in breadth. This is surmounted by 4 smaller towers, which are crowned by a small cupola, the whole terminating in the *giralda*, which gives its name to the tower, a colossal bronze statue of Faith, bearing a flag and palm-branch, 14 ft. in height, and of great weight, but so delicately poised as to turn with the slightest variation of the wind. The height from the ground to the top of the statue is said by Miliano to be 364 Span. feet. The ascent to the top of the great tower is by an inclined plane, so gradual that one may ride up without inconvenience; the view from the summit is superb, extending over the entire plain. In point of riches, this cathedral ranked second only to that of Toledo. It had, also, with the church of the Capuchins, and the chapel of the hospital de la Caridad, some noble pictures by Murillo; but, though some of these have been preserved, others have become, either by purchase, or the right of conquest, the property partly of private individuals, and partly of Marshal Soult, and other French generals.

Some of the Castilian monarchs are buried within the cathedral; but, as Bourgoing has observed, these tombs excite no emotions compared to those excited by the sight of the slab, in front of the choir, which once covered the remains of Columbus. It is inscribed, *A Castilla y Aragon otro Mundo dio Colon*—To Castile and Aragon Colon (Columbus) gave another world. A sublime and not too ambitious epitaph. We may add, that the remains of Columbus, after reposing here for about 30 years, were carried across the Atlantic, and deposited in the cathedral of St. Domingo; but, in 1795, on the capture of St. Domingo by the blacks, the ashes of the illu-

trious dead were again raised by the whites, and carried to the Havannah, where they are now deposited. It is worthy of notice, that the library belonging to the cathedral was begun in 1560, by the bequest of 20,000 vols. left for the purpose by Hernando, one of Columbus' sons.

The large organ, which is considerably larger than that of Haarlem, has altogether 5,300 pipes, with 110 stops. "Nothing," says Inglis, "can exceed the majesty of the music awakened by this organ, and, at times, the effect is almost too overpowering for human senses." (*Inglis*, i. 57, 58; *Cook's Sketches*, i. 132, and ii. 93, 96.)

Immediately under the Giralda, occupying one side of a small square, is the archbishop's palace, with a handsome front, and opposite to it is the *Lonja*, or exchange, a quadrangular edifice, with a central *patio*, comprising apartments, some of which are still used by the merchants, though the greater part has been converted into an *Archivo de los papeles de Indias*, or repository for American archives; the voluminous records here preserved being as carefully placed and ticketed, as if Spain still continued to give law to her *ci-devant* transatlantic possessions! The floors are laid in chequered marble; and the grand staircase is of highly polished red marble, and remarkably handsome. (*Scott's Rome and Granada*, ii. 106.) A little removed from the Lonja is the Alcazar, a royal palace and gardens, said to have been constructed in imitation of the Alhambra, principally by Peter the Cruel and Charles V. Swinburne correctly terms it, "a pasticcio of Saracenic, conventual, and Grecian architecture." The exterior has a miserable appearance; but the first court, after entering the gate, has a grand effect. It is 93 ft. in length, by 69 ft. in breadth, flagged with marble, and surrounded with a colonnade of white marble Corinthian pillars, of handsome proportions, and well executed, the walls behind being covered with grotesque designs in the Moorish taste. Next to the Court of Lions, in the Alhambra, this court is perhaps the best piece of Arabic building in Spain for execution and delicacy of design, though the ornaments of the palace in Seville are much inferior to those of that in Granada. The Alcazar comprises a suite of 78 successive apartments, having carved ceilings, with walls, like those of the Alhambra, with well-preserved arabesques. By far the most splendid, however, is the Hall of Ambassadors, a splendid apartment, adorned with designs in stucco, and with a floor of variegated marble. Within the Alcazar are many fine paintings, by Murillo, Velasquez, Luis de Vargas, and other Spanish masters, with a few specimens of the Italian school; but several of the best pictures have, within the last few years, been removed to the public gallery at Madrid. A considerable portion of the palace is now let out in lodging-houses, and to private individuals; the portion reserved for the sovereign comprising only a small section of the entire pile. The gardens, which are of small extent, are laid out according to the Moorish taste, in formal alleys, with clipped myrtle hedges and trees, cut to resemble warriors armed with clubs. The walks in some parts are laid with tiles, through which *fais-d'eau* are made to flow, which, by turning a screw, suddenly water not only the garden, but its unwary visitors. The *Casa Pilata*, another of the sights of Seville, is a private house, said to have been built on the exact model of that of the Roman governor of Jerusalem! Within the city, also, are many structures of Roman origin, which still show traces of their former magnificence. The octagon tower, or *Torre d'Oro*, was probably built by one of the Caesars. The *Caños de Carmona*, a Roman aqueduct of 410 arches, still conveys water to the city from Alcala; and the gates, especially that of Triana, are very magnificent, though of equally ancient origin. Most of the other objects worth notice are without the walls. The first in order is the *Plaza de los Toros*, or circus for bull-fights, half wood and half stone, and capable of accommodating 14,000 spectators.

The next remarkable object is the royal tobacco-manufactory, a huge edifice 440 ft. in length by 280 ft. in breadth, so strongly built and guarded by walls and ditches, as to appear like a fort or citadel, raised to overawe the citizens. It employs about 400 hands, of which more than a half are engaged in making cigars. But, despite all the precautions of government, fully nine tenths of the cigars made use of are said to be clandestinely imported. (*Scott*, ii. 110.) The cannon-foundry is, on the whole, a creditable national institution, though not at present in any great activity. Among the other public establishments, may be specified the cavalry barracks, royal saltpetre manufactory, military hospital, &c. The market-place is large, and admirably suited to its purpose, the buildings being arranged in streets, an open space surrounding the whole, with gates and ornamental fountains. In the suburb of Triana is a separate market for the supply of the *gitanos*, or gypsies, its chief inhabitants.

The arrangement of the streets is very different from

that observable in most other Spanish towns, and is mainly the effect of the hot climate. To a similar cause may be traced the internal arrangement of the houses. They are built almost universally in the form of a square, with a spacious court-yard, or *patio*, frequently paved with marble, and surrounded by piazzas opening on the apartments of the ground-floor; the exterior as well as every other part of the house being kept carefully white-washed, the massive green wooden blinds of the windows being kept closely shut during the day. In addition to this, the rooms, which are usually paved with tiles, are furnished with ponderous window-shutters half a foot thick, kept shut till the sun is off the windows, when they are partially opened to admit the breeze. Hence the houses are so very dark, that visitors at first with difficulty distinguish the inmates. The climate may also be said to divide the houses into two distinct parts. During the winter months (commencing in Oct. and ending with April) the family inhabits the upper parts of the house, which are then thickly matted, and the rooms artificially heated by brasiers of charcoal; but when the hot weather sets in, these apartments are shut up, and a general move is made to the ground-floor, which, being considerably cooler, and opening on the *patio*, renders the heat more endurable. "It is a pretty sight, indeed," says Sir A. C. Brooke (*Travels in Spain and Morocco*, i. 45.), "to saunter during the delicious moonlight evenings of summer along the fashionable streets of the city; and nothing can be more strikingly brilliant than the appearance of the houses and hotels of the nobility and wealthier classes. On looking through the trellissed iron door opening to the street, you perceive the entire *patio* brilliantly illuminated, well furnished, and with pictures suspended from the marble columns of the arches. An awning forms a sufficient roofing by night as well as by day, and converts the space below into a spacious and lofty saloon, in the centre of which different *jets-d'eau* spout forth from a marble fountain, both cooling the air, and watering a variety of sweet, odoriferous plants, scattered around in flower-pots. Here the young ladies of the family may be seen enjoying the coolness of the evening, engaged in work, amusing themselves with music and singing, and receiving the visits of their friends." These summer habits are truly Moorish; and even in trifles glimpses of them become easily visible, as, for instance, in the contempt of chairs, for which mats and low stools are pretty generally substituted by all classes.

The aspect of the pop. of Seville differs greatly from that of Madrid. Even in the upper ranks, there is something in the ladies of an eastern appearance; they are more frequently veiled, their cheeks seem tinged with a hue of Moorish blood, and, along with the fire of a Castilian eye, there is mingled a shade of Oriental softness. Among the lower orders of the women, also, as among the Moors, may be remarked an extravagant and tasteless profusion of gaudy ornaments, immense ear-rings and bracelets, numerous rings, &c.; and the dress of the Andalusian peasant is even more grotesque and ornamented than that of the women, his jacket and waistcoat being almost always trimmed with gold or silver, and every article of his dress covered with silk cords and tassels. Another striking difference between Madrid and Seville is in the great mass of ragged, wretched-looking people in the latter, in consequence mainly of the heat of the climate, which renders labour a disagreeable exertion, especially in a country where subsistence is so easily procured. Let a small loaf of bread be given to one of these sons of idleness, he makes a hole in it; begs a little oil, not worth refusing, which he pours in, and soaking his bread as he eats it, he is set up for the day; and if he succeed in getting a two-quarto piece, he may procure as many grapes as his heart can desire. What indolence has such a one to be busy? The upper and middle ranks of Seville live more luxuriantly, but not better than those of Madrid; for the luxuries of the former, theiriced waters, lemonade, and pomegranates, their cool patios, fountains, and baths, are necessary to health and comfort. But even in his ordinary diet, the Andalusian has the advantage over the Castilian; for though it be true that, like the inhabitants of the northern provinces, he dines on the eternal *puchero*, its ingredients are better in Andalusia than in Castile, the pigs being fed on the flex-nuts and the vegetables of S. Spain, being perhaps the finest in the world. The difference between Andalusia and Castile is still further observable from the state of society in the two provinces. The tertulia of Seville is quite different from that of Madrid, the former being at any rate more animated, if not more intellectual, and the dullness helped out with cards, dancing, forfeits, and other amusements, independent of mere chit-chat and *persiflage*. Balls and suppers are reserved for great occasions; but certainly substantial entertainments are more general than in the capital, perhaps because wealth is more generally diffused. Morals are at a very low ebb.

The feast, the song, the revel here abounds;  
Strange modes of merriment the hours consume,  
Nor bleed these patriots with their country's wounds.  
Nor here War's clarion, but Love's rebeck sounds;  
Here Folly still his votaries intrahs;  
And young-eyed Lewdness walks her midnight rounds:  
Girt with the silent crimes of capitals,  
Still to the last kind Vice clings to the tottering walls.  
*Chilse Harold*, l. 37, at 6.

In Seville it is almost a derision to a married woman to have no *cortejo*, and a jest against a *seforista* not to have her *amante*. Indeed, the gallantries of the latter are not unfrequently carried quite as far as the intrigues of the former. (*Inglish*, ii. 39—41.)

But with all this corruption, the course of society runs smooth; jealousy appears not to disturb the *ménage*, the parties living together with all the outward show of mutual esteem, and indicating the history of their private bickerings only on their most intimate friends. The amusements of the middle and higher classes consist of the daily promenade on the *Paseo* or *Alameda* (the Hyde Park or Regent Street of London); theatrical entertainments, of which they are passionately fond, and no mean judges; and the tertulia, which are so arranged as to succeed each other in the arrangements of the day. The lower classes are fond of dancing; but of music they have little knowledge, for nothing can well be more disagreeable than their crazy guitars. (*Scott's Ronda*, ii. 123—124; and *Inglish*, *ubi supra*.)

Seville, as a place of residence for a stranger who cares only for sensual gratifications, is perhaps preferable to any other Spanish city. It is said that there is not a day throughout the year in which the sun does not shine on Seville. Winter is scarcely felt; and if the heats of summer be oppressive, as they truly are during the prevalence of the *solano*, the streets, houses, and economy of life are admirably adapted to lessen their influence. The surrounding country, with its orange and lemon groves, acacias, and other flowering trees and shrubs, is all that one can desire: fruits of many varieties and choice flavour may be had almost for nothing, and every necessary of life may be procured in abundance, and at very moderate rates. Game, fruit, and vegetables are excellent; and the bread (brought to market from the neighbouring village of *Alcala dos Panadores*) is said to be the best in Spain. Meat is reasonable, but of rather indifferent quality.

Seville has several establishments for the promotion of learning, science, and general education; but of these few, if any, can be considered as very efficient. Its university, founded in 1502, is in the most backward state possible. The other scholastic establishments comprise a school of medicine, two mathematical schools, a college of agriculture, and an academy of the fine arts, besides the ancient, though decaying, school of St. Elmo for navigation and gunnery. Seville has also several societies for the promotion of different branches of literature and science; but they exercise little influence, owing to the general want of sound elementary education.

If we might believe the stories which book-maker after book-maker has repeated, *usque ad nauseam*, of the former flourishing state of manufactures in Seville, we should certainly conclude that in the 15th and 16th centuries it was decidedly superior, as a manufacturing town, to what Manchester now is! It is said, for example, to have had, in 1519, 16,000 silk looms, and 130,000 persons employed in the various branches of the silk manufacture! \* Such a statement carries absurdity on its face; and Capmany has shown conclusively, from the letter of the Venetian ambassador, Navagero, who visited Seville in 1525, and otherwise, that it is doubtful whether it had then a dozen silk looms; and that, instead of being a city with some 500,000 or 600,000 inhab., as must have been the case had it had 130,000 engaged in the silk trade only, there is no reason to think that it was then larger or more populous than at present. (*Questions Critiques*, p. 27., &c.) It is true that at a subsequent period the silk manufacture attained to considerable importance in Seville, there being, in 1650, about 3,400 looms engaged in the business. The manufacture has since undergone many vicissitudes; but in the earlier part of the present century it employed about 2,400 looms, and still more to the harassed state of the country for many years back, the number of looms is at present reduced to from 500 to 600. Coarse woollen cloths are made in considerable quantities, but they are both inferior to, and much dearer than similar English fabrics. There are several large tanneries, manufactories of hats, combs, earthenware, &c.; but, as in the rest of Spain, the processes are so clumsy, that, speaking generally, all manufactured articles are of inferior quality. The to-

\* Among others, these statements are given as if they were unquestionable by Laborde (*Itinéraire*, iii. 258, ed. 1835); and by Moreau de Jonnés, in his *Statistique Répondue*, i. 15. The latter, indeed, is a wretched performance, totally unworthy of confidence.

bacco manufactory, iron foundry, and saltpetre establishment, have been already mentioned as government monopolies. The trade of Seville rose to considerable importance after the discovery of America, in consequence of its being vested with the monopoly of the commerce between Spain and the New World. This advantage, however, was soon lost, from the difficulty of navigating the Guadalquivir with large vessels; and the trade was transferred to Cadiz. The river, at certain times of the year, is accessible as far as Seville for ships of 100 tons; but, generally speaking, all vessels drawing more than 10 ft. water are obliged to load and unload 8 m. below the city. Some efforts, however, have lately been made for the improvement of the navigation. The exports comprise wool, goat-leather, oil, silk, and fruit, particularly oranges. The trade in oranges is carried on principally with England, to which about 40 cargoes are sent every year, comprising about 16,000 chests, 1-10th of which are bitter, and the rest sweet oranges: the chief part of the export takes place in Nov. and Dec. The imports comprise various manufactures from England (many of which, however, are contraband); hides, hemp, and flax, from the Baltic; iron from Bilbao, and colonial produce from Cuba and Porto Rico. A considerable coasting trade is carried on with Cadiz, Malaga, Barcelona, and other ports of Spain; and there is daily steam communication with St. Lucar and Cadiz.

Seville stands on the site of the *Hispalis* of the Romans. It opened its gates to the Moors in 711, soon after their invasion of Spain, and continued in their possession above five centuries, being the seat first of a regal, afterwards of an aristocratical government. It was taken by the Christians in 1247, after one of the most obstinate sieges mentioned in Spanish history; but since then it has seldom been the scene of military exploits. It is known in diplomatic history by a treaty concluded in it in 1729, by Spain, England, France, and Holland. In the autumn of 1800, it was visited by the pestilential fever which caused such mortality at Cadiz, and it is said that between the 12th Aug. and 1st Nov. of that year, it lost nearly a fourth part of its inhab., half the sufferers being, however, Gitanos or gypsies, inhabiting the suburb of Triana. On the invasion of Spain by Napoleon, in 1808, Seville asserted the national independence, and received the junta when driven from Madrid. It however surrendered to the French, on the 1st February 1810, and remained in their hands till the 27th August, 1812, when they left it, in consequence of their defeat at Salamanca.

Seville has given birth to several distinguished individuals, among whom have been included in antiquity the emperors Adrian, Trajan, and Theodosius. There can, however, be little or no doubt that these illustrious individuals were all natives of Italica, a Roman city, a few miles N.E. from Hispalis. Among the more remarkable individuals of whom Seville has to boast in modern times may be specified Las Casas, bishop of Chiapa, the defender of the Indians; Antonio de Ulloa, the traveller and economist; Lopez de Rueda, the father of Spanish comedy, &c. The famous navigator, Magellan, or Magelhaens, sailed from Seville on the 20th of Sept., 1519, on the expedition in which he discovered the straits that bear his name.

SEVRES, a small town of France, dép. Seine-et-Oise, on the Seine, about midway between Paris and Versailles, being 5 m. N.W. the latter city. Pop. about 4,000. It has been long famous for its royal manufactory of porcelain, or *Sevres china*; which, for elegance of design and excellence of quality, is equal, if not superior, to any made in Europe. A large museum is established here, in which are collected specimens of most kinds of earthenware manufactured in France and other countries. There is a warehouse in the Rue Rivoli, in Paris, for the sale of Sevres china. The quarries whence the clay used in the manufacture of the porcelain has been obtained form extensive wine vaults. The Seine is crossed here by a handsome stone bridge.

SEVRES (DEUX-), a dep. of France, reg. W., principally between the 46th and 47th degs. N. lat., and 0° and 1° W. long.; having N. Maine-et-Loire, E. Vendée, S. Charente and Charente Inférieure, and W. Vendée. Area, 607,350 hectares. Pop., in 1836, 294,850. A hill chain, running from S.E. to N.W., divides the dep. into two portions, very unlike each other in their general aspect, the southern being nearly flat, and the northern very much diversified. Principal rivers, the two Sevres (or *Niortaise* and *Nantaise*), whence the name of the dep.: one discharges itself into the Atlantic in Vendée, the latter falling into the Loire. A large proportion of the soil is stony, but there are some rich tracts. In 1824, the arable lands were estimated at 404,355 hectares; meadows, 74,953 do.; vineyards, 20,993 do.; orchards, 9,675 do.; and woods, 36,090 do. Shallow lakes, pools, &c. occupy at least 10,000 hectares. Agriculture is generally very backward, being, in most parts, distinguished by an obstinate attachment to old methods; but more corn is raised than is required for home consumption. Flax,

hemp, various fruits, &c., and about 350,000 hectol. of wine, are annually produced. The quality of the latter is, with few exceptions, very inferior, and about half the produce is made into brandy. The annual produce of wool is estimated at 400,000 kilog. Fat cattle, hogs, poultry, timber, brandy, and vinegar, are the principal exports of the dep. In 1835, of 127,942 properties subject to the *contrib. foncière*, 69,394 were assessed at less than 5 fr., and 17,611 at from 5 to 10 fr. Minerals unimportant. The manufacturing industry of the dep. is of little consequence. It is divided into four arrondis: chief towns, Niort (the cap.), Pressuire, Melle, and Parthenay. It sends 4 mems. to the Ch. of Dep. Registered electors, in 1834-35, 1,575. Total public rev. in 1831, 5,747,475 fr. (*Hugo, art. Deux-Sevres; French Official Tables.*)

SHAFTESBURY, a parl. and mun. bor. and market-town of England, co. Dorset, partly in Sixpenny Handley hund., and partly in Alcester liberty, on the border of Wilts, 22½ m. N.E. Dorchester, and 95 m. S.W. London. Previously to the Reform Act, the mun. and parl. boundaries of the bor., which were co-extensive, comprised only portions of the parishes of the Holy Trinity, St. Peter, and St. James; with a pop., in 1831, of 2,742. But since then the municipal limits have been enlarged, so as to include the whole of those parishes, with that part of Motcomb in which Enmore Green and Long Cross are situated; and the parl. boundary comprises the entire parishes of Cann, St. Rumbald, Melbury and Compton Abbas, Tower Provost, East Stower, Tordere, St. Margaret's Marsh, Motcomb, Donhead (in Wilts), and the chapelry of Hartgrove, making a total area of 20,910 acres. Pop., in 1831, 8,969.

The town is situated on the top, and extends nearly to the verge of a high narrow hill. It is healthy, though, from its situation, the air is often bleak and piercing. Though irregular, it is well built, a large proportion of the houses being constructed of freestone quarried in the neighbourhood. Shaftesbury had anciently 12 churches, besides several chantries, a celebrated monastery, an hospital, &c. It has now but 3 churches, the principal of which, St. Peter's, is of great antiquity, and has some elegance, though much disfigured by modern alterations. Holy Trinity is joined with St. Peter's, St. Martin's, and St. Lawrence, in a rectory worth 168*l.* a year. St. James's is also a rectory, worth 26*l.* a year. Both livings are in the diocese of Bristol, and the gift of the Earl of Shaftesbury. (*Ecc. Rev. Rep.*) In the spacious and well-planted churchyard of Holy Trinity is inclosed a considerable portion of the wall of Shaftesbury Abbey, being all that remains of that once famous edifice. It is said to have been erected by the wife of Edmund, great grandson of king Alfred, for Benedictine nuns. (*Camden, Gibson's ed. i. 60.*) It was afterwards called St. Edward's Abbey, from Edward the Martyr, who was murdered at Corfe Castle, having been buried in it. After the churches, the principal public buildings comprise a handsome town-hall, recently built by the Marq. of Westminster, at an expense of 3,000*l.*, and meeting-houses for Friends, Independents, Wesleyans, &c. A free school, for 20 poor boys, was founded in 1719; and there are almshouses for both men and women. From its elevated position, Shaftesbury labours under a deficiency of water, which is conveyed up the hill in carts or on horseback, its supply affording employment to a number of persons. The town had formerly a manufacture of shirt buttons, which employed many women and children; but it has now ceased, and it has few outward signs of prosperity, though it is said that its condition has latterly improved. (*Boundary Rep., &c.*)

Shaftesbury is mentioned as a bor. in Domesday Book; but its only existing municipal charter is that of James I., confirmed by Charles II. It sent 2 mems. to the H. of C. from the reign of Edw. I. down to the passing of the Reform Act, which deprived it of one of its members, and at the same time increased its boundaries as already stated. The election for mems. was formerly vested in the inhabs. paying scot and lot. Reg. electors, in 1830-40, 491. Since the Municipal Reform Act it has been governed by a mayor, 3 other aldermen, and 12 councillors. Corp. revenue, in 1840, 140*l.* No courts are held within the bor. Market-day, Saturday; fairs, Palm Saturday, June 24, Nov. 23, for all kinds of cattle.

Shaftesbury is supposed to be on or near the site of an ancient British town called *Carverton*; but it was of little importance till the foundation of its monastery, and has latterly depended principally on its political privileges. It gives the title of earl to the noble family of Ashley Cooper. (*Parl. Munic. and Boundary Reports, Appendices, &c.*)

SHAHABAD, a district of British India, presid. bengal, prov. Bahar, between the districts of Patna, Bahar, and Ramghur, on the E. and S., and Benares, Ghazepoor, and Sarun, on the W. and N. Area, 4,680 sq. m. Pop. (1822), 908,590, nearly all Hindoos. The Ganges bounds it N., the Sonc W., and the Caranassa E. It is very fertile, its staples being opium, tobacco, cotton, sugar, indigo, and hemp; it is celebrated for the excellence of its

roads, a distinction mainly owing to a salutary reservation in the original land settlement with the Zemindars of a certain annual sum to keep them in repair. Total land revenue (1829-30), 14,80,483 rupees.

SHAHJEHANPOOR, a district of British India, prov. Delhi, having N.E. Nepal, E. Oude, S. the latter and the district of Furruckabad, and W. Salwan, Bareilly, and Pilibheet. Area, 1,420 sq. m. Pop. uncertain. Total public revenue in 1829-30, 11,24,136 rup. Its cap. town of the same name, 175 m. S.E. Delhi, is reported to be more wealthy and nearly as populous as the latter city; so that it may probably have 50,000 inhabs. (*Hamilton*.) There are 3 other towns, named Shahjehanpoor, in Malwah, Lahore, and N. Hindostan.

SHANNON, a river of Ireland, being by far the largest and most important in that island, and hardly indeed inferior, if it be not superior, to any in the United Kingdom. It has, in many respects, particularly in its nearly insulating an extensive prov., in the direction of its course, the length of its navigation, and the magnitude of its estuary, a striking resemblance to the Severn. Its source is generally traced to the base of Cullcagh Mountain, in the N.W. part of Cavan. After running a few miles, it falls into Lough Allen, about 10 m. in length, and from 4 m. to 5 m. broad; its course thence to Limerick being S., with a small inclination to the W.; issuing from Lough Allen, it passes Leitrim, Carrick, Tarmohur, &c., entering Lough Ree, at Lanesborough. This, which is a very irregularly-shaped extensive sheet of water, is about 17 m. in length. Leaving it, the river, now greatly augmented, passes Athlone, and then winds by Shannon Bridge and Banagher to Portumna, near which it expands into Lough Derg, a narrow lake, 23 m. in length, with deep bays and inlets. Escaping from the S. extremity of this lake, it flows on to Limerick. Here having met the tide, it takes a W.S.W. direction; and, gradually expanding into a noble estuary, unites with the Atlantic, between Kerry Head and Loop Head, about 70 m. lower down.

From the head of Lough Allen to its mouth, the Shannon has a course of about 214 m.; viz., Lough Allen, 10 m.; Lough Allen to Lough Ree, 43 m.; Lough Ree, 17 m.; Lough Ree to Lough Derg, 36 m.; Lough Derg, 23 m.; Lough Derg, to Limerick, 15 m.; and thence to the river's mouth, 70 m. Loop Head and Kerry Head are about 8 m. apart.

But the distance to which it has been rendered navigable is the most extraordinary circumstance connected with the Shannon. In this respect, indeed, it is superior to the Thames, Severn, Trent, or any English river. If Lough Allen be (as it is considered by some) reckoned its source, it is navigable to its very head; but, tracing its origin to the base of Cullcagh Mountain, there are only 6 or 7, out of its entire course of about 220 m., that may not be navigated! It is unnecessary to insist on the value of a river of this sort flowing through the very centre of Ireland, insulating the great province of Connaught, and "washing the shores" of 10 out of the 32 cos. which the island occupies.

Unluckily, however, the navigation of the Shannon, like that of most other rivers not of very great depth, is, in certain places and at certain seasons, of good deal obstructed. It may be navigated, with no very serious difficulty, from the sea to Limerick by ships of 400 tons burden. But immediately above the city, and in some other places, its course is impeded by rocks and rapids, and large sums have been expended in improving those parts of the navigation, partly by making lateral cuts, and partly by deepening the bed of the river. The level of Lough Allen is about 144 ft. above high water-mark at Limerick, the ascent being in a great measure overcome by one double lock and twenty single locks, placed in those situations where lateral cuts have been made to avoid the rapids. These cuts are from 13 to 14 ft. wide at bottom, having the usual slopes, and are calculated for a depth of water varying from 4 to 7 ft. in ordinary seasons. Still, however, it must be admitted that, considering its paramount importance, the navigation of the Shannon is by no means in a satisfactory state. In dry seasons it is impeded by shallows, on which there are sometimes only from 2 to 3 ft. water; and during floods the channel of the river, owing to its frequently expanding into extensive lakes, and the lowness of its banks, is not easily discovered. Had it been an English river, these difficulties would have been overcome long ago; and the money expended upon it might, had it been properly and effectually applied, have sufficed to obviate them. But the works have not unfrequently been very unskillfully and insufficiently executed. It is now, however, under much better management; but it will require a considerable additional expenditure to put the works into proper order, and to ensure at all times, what is so very essential, a safe and easy navigation. The introduction of steam tugs and steam vessels on the lengths of the Shannon has been of infinite service; without them, indeed, it never could have been turned to much account.

The Suck, the principal tributary of the Shannon, rises in Roscommon. Its course is S., inclining to the E., dividing the cos. of Roscommon and Galway, by Castleregagh, Athleague, and Ballinastor, till it unites with the Shannon at Shannon Bridge. On its E. side the Shannon receives the Inny, the Upper and Lower Brosna, Mulkerna, Maig, Fergus, &c. The last two are navigable to a considerable distance.

The importance of the Shannon, as a commercial river, has been materially increased by its junction with the Grand and Royal Canals from Dublin. Though defective both in their plan and execution, and made at an immense expense, still it is not to be denied that they are, particularly the Grand Canal, of great public utility. In connection with the Shannon, they have opened a communication by water across the island, so that persons living in its centre may send their produce, at a moderate expense, to Dublin or Limerick, as they find most advantageous. This laying open of new and almost boundless markets has given a stimulus to the improvement of the central parts of Ireland, of which it is not easy to overrate the influence, and which will, no doubt, be as permanent as it is powerful.

From its situation at the head of the estuary of the Shannon, in a country naturally of the most exuberant fertility, 70 m. from the sea, Limerick is the principal emporium of the W. of Ireland; and its commerce is both extensive and rapidly increasing. The value of the produce, such as corn, flour, bacon and pork, butter, beef, &c., shipped from the port in 1820, amounted to 525,525*l.*; and in 1835, when prices were very low, to 726,000*l.* In ordinary years it may now (1842) be taken at 1,200,000*l.*

The badness of the accommodation for shipping is, however, a heavy drawback upon the trade of Limerick. At low water ships are obliged to lie aground; and as the bottom consists of hard, rugged, limestone rock, vessels of considerable burden, and those that are sharp built, are liable to be seriously injured by grounding.

But, as already stated (see art. LIMERICK), measures are now in progress to obviate these inconveniences, by constructing a floating harbour in the bed of the river opposite the city. (*Statistical Acc. of the British Empire*, i. 530.)

SHEERNESS, a sea-port and market-town of England, in the par. of Minster, lath. S. Cray, co. Kent, on a low tongue of land at the N.W. extremity of the Isle of Sheppey, at the confluence of the Thames and Medway, on the E. bank of the latter, 184 m. W.N.W. Canterbury, and 364 m. E. by S. London. Pop., inc. par., in 1831, 7,983. The town, which owes its rise to the formation of the naval dockyard, is divided into three parts, called respectively, Sheerness-proper, Blue-town, and Miletown, the first two being enclosed by fortifications. During the last few years, also, and especially since the fire of 1817, which destroyed about 50 houses, the town has been much enlarged, as well as greatly improved, by the erection of good brick houses, and the formation of several new streets, well paved, and lighted with gas. The town was formerly very ill supplied with water; but at the beginning of the present century, a well was sunk by the Board of Ordnance to the depth of 360 ft., which supplies water, not only to the town and garrison, but to the shipping in the Medway. A pier with a causeway runs down from the town to low-water mark; and facing both the river and sea is a wharf of considerable extent. Several old ships of war, also, have been stationed on the shore as breakwaters; formerly they used to serve as dwellings for many of the poorer townpeople, but few of them are now inhabited. The par. church is at Minster, but a handsome district church has been erected in the Gothic style; and attached to the garrison is a chapel, the appointment to which is with the Board of Admiralty. The Baptists, Independents, Wesleyan Methodists, Unitarians, and R. Catholics have their respective places of worship, and there is a Jews' synagogue. Sunday-schools are attached to the town church, and to several of the chapels: an infant school is attended by about 200 children; a proprietary school has upwards of 40 boys, and there is a small endowed charity-school. The trade of Sheerness arises chiefly from the dockyard, and other government establishments, though considerable shipments are made to London of corn and seeds produced on the island, and of oysters from the adjoining oyster-beds. Pyrites are collected from the crumbling cliffs for the copperas works in the neighbourhood; and many of the inhabs. make a living by picking up or dredging for septaria (an oxide of iron), used in making Parker's Roman cement. Sheerness has also become, to a certain extent, a resort of sea-bathers for whose accommodation there are reading-rooms, baths, bathing-machines, &c. Steamers run daily to and from London during summer, besides passage-boats to and from Chatham, which is about 11 m. up the Medway. Markets on Saturday.

The dockyard, which covers an area of about 50 acres,

enclosed by a substantial brick wall, has been greatly extended and improved during the last 25 years, at an expense of above 1,000,000*l.* sterling. It has every convenience for the building, repair, and fitting out of ships. It comprises a wet dock or basin of about 34 acres, capable of accommodating 10 sail of the line, and in which they may take on board their stores, ammunition, and provisions, and be, in all respects, equipped ready for sea. Three dry docks, each suitable for the accommodation of a line-of-battle ship, have been constructed on the E. side of the basin, and open into it. It has also very extensive storehouses, with mast-houses, mast ponds, and slip, smithery, and artificers' workshops of every description; with handsome residences for the commissioners, port-admiral, and other officers of the establishment. The principal offices of the ordnance department were, a few years since, removed to Chatham, and the area formerly occupied by them has been added to the dockyard. The wharf wall, on the S. side of the basin in front of the mast-house, is 100, and that on the river front 60 ft. in width, lined on both sides with granite. Numerous convicts are employed in the dockyard and on the hulks, chiefly in the improvement and repairs of the former.

Sheerness, which so late as the time of the Commonwealth was a mere swamp, was fixed upon after the Restoration as an important position for a fortress. The works, however, were still incomplete when the Dutch, under De Ruyter, in 1667, took and destroyed the fortress and the shipping. (See CHATHAM.) The fortifications were afterwards constructed on a larger scale; numerous batteries of heavy artillery were planted on both banks of the river. The dockyard was begun early in the last century. The mutiny of the fleet at the Nore, in 1798, threatened the town and dockyard with destruction, which, however, was happily averted. (*Enger. Brit.*, new ed., art. *Dockyards*; *Hasted's Kent*, &c.)

SHEFFIELD, a par. bor., market-town, and par. of England, cap. of the district of Hallamshire, W. Riding, co. York, upper div. of wap. Strafforth and Tickhill, at the confluence of the Don and Sheaf, the former of which is crossed by three and the latter by two bridges, 39 m. S. Leeds, and 140 m. N. by W. London. Area of par. bor. and par., which are co-extensive, 22,830 acres: pop. of par., in 1801, 45,755, in 1831, 91,692, and in 1841, 110,891. Pop. of Sheffield township in 1831, 59,011; in 1841, 67,267. The town, originally confined to the slope of a hill rising S.E. from the Don, is now nearly 2 m. in length by 1 m. in breadth, and occupies the bottom and sides of several low hills, rising in various directions both from the Don and Sheaf, the whole being well-paved and flagged, lighted with gas, and abundantly supplied with water. The older streets are steep, narrow, and singularly irregular; but the more modern streets are wide and straight, lined with good brick houses, and many of the shops are but little inferior to those of the metropolis. The smoke, however, proceeding from the numerous steam-engines, forges, and factories, gives the town a dingy, mean appearance, contrasting strangely with the extreme beauty of the surrounding country, embellished as it is, in every direction, by the numerous villas of the opulent bankers, merchants, and manufacturers of Sheffield. The market-place occupies a wide open space in the High Street, and near it are the par. church and principal houses: it is of modern construction, and comprises large shambles, and other accommodations. The corn-exchange, also, is a handsome modern building, comprising excellent accommodation for those frequenting the markets. The cutlers' hall in Church Street, belonging to the ancient corporation of cutlers, is a handsome stone building, with rooms for the transacting of corporate business, public meetings, dinners, &c. The par. comprises 12 churches, 7 of which are in the town, and the rest in the rural townships, the patronage of all, except two, belonging to the vicar, though the appointment of the four assistant clergymen at the par. church belongs to the 12 burgesses, or chief inhabs. of Sheffield. The mother church of the Holy Trinity is a noble Gothic structure, about 240 ft. in length by 130 ft. in breadth, and from its centre rises a tower surmounted by a lofty spire, of handsome proportions: the part now used for divine service, which excludes the ancient chancel, was rebuilt in 1850, and is fitted up in a solid and handsome manner, with accommodation for upwards of 2,000 persons. In the chancel are some curious old monuments, and a fine bust of the late vicar by Chantrey. St. Paul's, in Norfolk Street (erected by subscription in 1720), is a rather heavy Greek structure, with a tower surmounted by a dome, and a cupola of cast-iron. St. James's, near the par. church, also of Grecian architecture though small, is well arranged, and at the E. end is a fine stained glass window, representing the crucifixion. St. George's, on an eminence, at the W. extremity of the town, erected, in 1824, at an expense of 15,130*l.*, chiefly defrayed by the par. commissioners, is in the later English style, and has a lofty square embattled tower, crowned with pinnacles. St. Philip's,

near the Infirmary, and St. Mary's on the S.E. side of the town, are in a similar style, and equally handsome, both having been erected, like St. George's, at the expense of the par. commissioners. St. John's is a still more modern building. Besides the churches, which have accommodation for upwards of 15,000 persons, there are twenty places of worship for different denominations of dissenters. Six of these belong to the Wesleyan Methodists, and are among the largest as well as the most ornamental buildings of the town: the Independents have five large places of worship, and there is a handsome Roman Catholic chapel. Most of the places of worship have attached burial grounds; but the custom of interring the dead in the town will probably grow into disuse, from the opening of an extensive cemetery in the S.W. suburbs. Connected with the various places of worship are numerous Sunday-schools, furnishing religious instruction to about 7,000 children, fully 3,000 of whom are taught by the Wesleyan Methodists, here a numerous and intelligent body. Three national schools are attended by 500 boys and 650 girls: 4 Lancastrian schools (one of which is supported by the Wesleyans) by 750 boys and 400 girls, and 7 infant-schools by upwards of 1,000 children of both sexes. The out-townships have also numerous Sunday-schools, with 8 national and 3 infant schools. A grammar-school, founded in the reign of James I., has an endowment of about 140*l.* a-year, 3-5ths of which are paid to the head-master and 2-5ths to the usher, both of whom receive entrance-fees, and other extra-payments, from the pupils. The management of the school, and the appointment of the masters, is vested in the vicar and 12 burgesses of Sheffield. A charity-school, established in 1796, provides clothing, board, and instruction, with an apprentice-fee for 90 boys, and a similar establishment for 70 girls was formed in 1786. A collegiate school, founded a few years ago on a joint-stock principle, is well attended; and more recently, the Wesleyan body have established a proprietary school, in which 300 boys are boarded and liberally educated, partly with the view of providing for the better elementary instruction of the future ministers of that denomination. Among the many charities belonging to the par. of Sheffield, the principal is Lord Shrewsbury's Hospital, for 18 men and the same number of women: the buildings, which have been erected on a new site, consist of a centre and wings, in the later English style. Hollis's Hospital, a similar establishment founded in 1703, is endowed with funds for the support of 16 widows of cutlers, and a small charity-school. There are numerous minor charities, apprentice-funds, &c. in the town, and each out-township has its separate charities. (See *Char. Com.* 17th and 32d Reports.)

The general infirmary, which stands about  $\frac{1}{2}$  m. N. from the town, is a handsome stone building, with semicircular wings and a central portico, its interior comprising many large and airy wards, with accommodation for about 200 in-patients. Adjoining, but distinct from the infirmary, is a large building, now almost completed, to contain fever wards. The medical and domestic arrangements are complete; and, on the whole, it is one of the best regulated provincial hospitals in the kingdom. It was opened in 1797, having cost above 20,000*l.*, raised by subscription. It has, also, several dispensaries, lying-in charities, Dorcas societies, provident institutions, a large auxiliary Bible society, and various religious associations connected both with the established church and the several bodies of dissenters. A theatre was built in 1762, with attached assembly-rooms; and there is a handsome music-hall, in which concerts are frequently given.

A public subscription library in the music-hall is supported by 200 subscribers: the library attached to the mechanics' institute contains about 3,000 vols.; the literary and philosophical society (established in 1822), has a good collection of minerals, fossils, plants, &c. with apparatus for experiments; and the botanical society has a garden comprising 18 acres, tastefully laid out, and a glass conservatory, 300 ft. in length, filled with rare exotic plants. There are likewise two well-supported news-rooms, one of which, in High Street, has a handsome frontage, and a lofty elegant saloon. The chief commercial buildings are the post-office, excise-office, and assay-office, erected in 1773, soon after the rise of the silver-plating trade. Sheffield has also 2 private banks and a savings' bank, besides 5 joint stock banking companies; and 3 weekly newspapers.

Nothing is known of the early history of Sheffield, or of the origin of that business for which it is now so famous. But it had attained to eminence in the making of knives so early as the 13th century; for Chaucer, contemporary with Edward III., mentions, in his *Reeve's Tale*, the Sheffield "thwytel," or whittle, in such a way as shows it was then in common use. It does not appear ever to have lost the reputation for cutlery it had thus early acquired. In 1575 the Earl of Shrewsbury, lord

of the manor of Sheffield, sent to his friend Lord Burchleigh "a case of Hallamshire whittels, beinge such fruites as his pore cuntry affordeth with fame throughout the realme." (*Metal Manufactures, Cabinet Cyclop.*, ii. 5.) In 1624, a corporation was formed for the "good order and government of the makers of knives, scissors, shears, sickles, and other cutlery-ware in Hallamshire," the government being vested in a master, 2 wardens, 6 searchers, and 24 assistants, consisting of freemen only. The principal object in the formation of this corporation seems to have been the regulation of the marks or other devices which every individual was to strike or impress on the goods he made for sale. But these regulations can hardly be said to be any longer in operation.

The corporation continued on the footing fixed in 1624, till 1814, when an act was passed, permitting all persons indiscriminately, without their being freemen, or having served an apprenticeship, or obtained a mark from the corporation for their goods, to carry on business any where within the district of Hallamshire. This liberal and judicious measure has been of great service to the town, by inducing men of talent and enterprise, from all parts of the country, to settle in it, where their competition and industry have had the best effects.

For several centuries the manufactures of Sheffield were confined almost entirely to the making of sheath-knives, scissors, sickles, and scythes. About the beginning of the 17th century, a common tobacco-box and the Jew's harp were added to the list of manufactured articles; but it was not till about forty years after that the manufacture of clasp-knives, razors, and files, for which it is now so famous, was introduced. It has been remarked, that for about a century after this period the manufacturers discovered more of industry and perseverance than of enterprise or ingenuity in the conduct of their business. About 1750 they began, for the first time, to carry on a direct trade with the Continent. The manufacture of plated goods was soon after commenced; and from that period down to the present time, Sheffield has made an astonishing progress in the career of industry; and in many branches of the hardware manufacture has no superior, and in some no rival. (*Rice's Cyclop.*)

Like Birmingham, Sheffield was most probably indebted to her situation for her early application to the hardware business. Coal and iron are found in her immediate vicinity. The Don, on which she is built, and 4 smaller rivers which flow into the Don near the town, supply her with power to work mills for forging, cutting, and preparing the iron and steel used in her manufactures; and in this respect she has an advantage over Birmingham. The river was made navigable to within about 3 in. of the town so early as 1751; and a lateral canal has since prolonged the navigation to the town.

Cutlery, as it was the earliest, so it is still the largest and most important branch of industry. The principal articles are table-knives and forks, pen and pocket-knives of every variety and description, scissors, razors, surgical, mathematical, and optical instruments, scythes, sickles, saws, with all sorts of carpenters' tools, and so forth. The most beautiful and highly finished articles of cutlery exhibited in the shops of the metropolis, though stamped with the vendor's name, are mostly made in Sheffield, and the cutlery of this town is deservedly held in the highest estimation in all parts of the world.

With the exception of plated saddlery ware, almost all the other descriptions of plated goods made at Sheffield are reckoned superior to those made at Birmingham or any where else. Some of the best plated articles have silver edges, and, when used with ordinary care, last for a very long time, and can with difficulty be distinguished from silver. An extensive manufacture of articles of Britannia metal is carried on.

Mr. Jacob says that, in as far as he was able to ascertain by inquiries of platers, the owners of flattening-mills, and of the manufacturers of plated goods, he was disposed to estimate the silver used for plating in Birmingham and Sheffield, including with it that used at Walsall and other places, by saddlers' ironmongers, at about 750,000 oz. a year; and deducting from this 150,000 oz. used at Birmingham, and 100,000 oz. for that used at Walsall and other minor towns, there will remain 500,000 oz. for the consumption of Sheffield.

Sheffield produces few articles in copper and brass, and no toys; but, in lieu of these, she has some peculiar and important businesses. The conversion of iron into steel is carried on to a far greater extent here than in any other part of the empire; and most of the steel used at Birmingham and other places is prepared at Sheffield. The works of the Messrs. Sanderson, for the converting and preparing of steel by tilting, rolling, &c. are the most extensive and celebrated in the world.

The manufacture of files is one of the staple trades of Sheffield. Files are used in immense quantities at home, and are largely exported. Any one who has ever seen the process of file-cutting would be likely to conclude that it was an operation which might be successfully

performed by machinery, and a great variety of contrivances have been sent on foot in that view. Hitherto, however, none of them has completely succeeded; so that the best files continue now, as heretofore, to be cut by the hand.

Few comparatively of the Sheffield manufacturers have large capitals, and the business is not so generally carried on in workshops and factories as at Birmingham. A person worth a few shillings may commence business on his own account as a cutler; and in this class, individuals are not unfrequently journeymen one year and masters another, and conversely.

In 1833 some of the staple trades carried on in the town and the individuals engaged in them were specified as follows:—Table-knives and forks, 3,689 hands; pen and pocket knives, 2,680; razors, 754; scissors, 600; files, 1,768; saws, 563; edge-tools, 703; stove-grates, fenders, &c. 1,530; white-metal, 643; silver-plated goods, 500; making in all 13,430. (*Report on Manufactures, &c.* 1833, *Min. of Evidence*, p. 175.) But the hands engaged in the conversion of iron into steel, and in several other important trades, are not included in this specification. Wages in Sheffield vary at present (1841) from about 12s. to 40s. a week. The labour in some departments is very divisible, among others great skill is required. Grinders, particularly those who do not use water in the operation, inhale the finer particles of stone and steel, and are usually short-lived. Many efforts have been made to obviate this, as well as to lessen the risk of accidents in the grinding mills; but the employment continues to be more than usually unhealthy and dangerous; and as much skill is required in grinding the finer descriptions of knives and razors, wages being influenced by both circumstances, are generally high.

It was stated before the British Association that there are in Sheffield 50 workmen's clubs (most of which are unions), and their aggregate revenues may probably amount to 80,000l. a year, divided among about 9,000 members. Many hands are employed in grinding spectacle-glasses, most of which, indeed, come from Sheffield. The show-rooms and manufactories of the leading houses are freely opened to all respectable strangers, and afford abundant proofs of the ingenuity that has raised the town to its present importance. The workmen of Sheffield have been accused of a tendency to riot and insubordination; and no doubt several destructive riots have taken place during the present century, which have required the interference of the military for their suppression; but these have all originated in extreme distress, or in some temporary and accidental cause, and speaking generally, the inhabitants are distinguished by their orderly, good conduct. Few of the inhabitants live in cellars, like the poorer classes in Liverpool and Manchester, but occupy comfortable tenements, being, in this respect, much better off than those in most other large manufacturing towns. Sheffield enjoys the advantage of a direct canal communication, eastward to Hull, and by a very circuitous route westward to Manchester, Liverpool, &c. The Don was made navigable to Tinsley in 1751; other canals have subsequently been cut for the transmission of heavy goods, and the canal-basin of Sheffield is accessible to vessels of 50 tons; but the principal improvement has taken place within the last few years, by the opening of the railway to Rotherham, and its more recent connection with the N. Midland Railway, by means of which, and other connected lines, a speedy communication is established with London, York, Leeds, Birmingham, Manchester, &c. The facility of transit will also be greatly increased on the completion of the Sheffield, Ashton, and Manchester railway, which will bring the last-mentioned town within an hour and a half's distance of Sheffield.

This important manufacturing town had no voice in the legislature till the Reform Act, by which the parish was created a par. bor., with the privilege of sending 2 mems. to the H. of C. Registered electors, in 1839-40, 4,451. The county magistrates administer justice, and the lighting and watching is conducted by the police commissioners under the authority of a local act; but there is no proper municipal corporation, and an application made to the privy-council in 1839 for such was rejected, owing to the opposition of some of the most respectable inhabitants. A more recent application is still under consideration. The master cutler is, at present, the returning officer at elections for the borough. Sheffield is also one of the polling-places at elections for the W. Riding. The co. magistrates have jurisdiction within the town, and the police, regulated similarly to that of Manchester, Liverpool, &c. is very effective. The par. of Sheffield constitutes, with its out-townships, a poor-law union, the expenditure of which, for pauper maintenance, amounted, in 1839, to 14,637l. Markets on Tuesdays and Saturdays: fairs, Trinity-Tuesday for horses and cattle, and on Nov. 28. for cheese.

Sheffield is of great antiquity, and there can be but little doubt that close to or near it there was once a considerable Roman station. A town existed here under the Saxons; and in the reigns of the Plantagenets it was considered of sufficient importance to be defended by a strong castle. Mary Queen of Scots was confined for nearly 14 years in the Manor, a country seat near the town, belonging to the Earl of Shrewsbury, the owner, also, of the castle. The latter was seized in the civil wars by Sir John Gell, one of the parliamentary generals, and was demolished, by order of parliament, in 1646, there being now no remains except of the foundations. Its site, however, is still called Castle Hill. (*Illustr. History of Hallamshire; Statistical Account of the British Empire; Private Information.*)

**SHEPTON-MALLET**, a market-town and par. of England, co. Somerset, hund. Whitstone, on a branch of the Brue, surrounded by several small hills, about 5 m. E.S.E. Wells. Area of par. 3,770 acres. Pop., in 1841, 5,332. The town, which comprises a number of narrow streets and lanes, has been much improved of late years, by the construction of a new bridge, and the opening of new roads, &c.; near its centre is a curious market-cross, erected in 1500. The church, in the early English style, is a spacious cruciform structure, with a tower and spire at the W. end. The living is a rectory, in the gift alternately of the crown and Mr. Wickham: its gross value is £201 a year, but the curate's salary of 150l., and other demands, reduce the nett income to 533l. (*Eccle. Rep. Rep.*) Here is the county bridewell, a large and conspicuous edifice; and here, also, petty sessions are held. There are places of worship for Baptists, Independents, Wesleyans, and R. Catholics; a convent of visitation nuns, the only one of that order in the kingdom; an almshouse founded in 1699; and a free school, established in 1813. The town had formerly a flourishing manufacture of woollen goods, but this branch of industry is now much fallen off. Markets, Tuesdays and Fridays; fairs, Easter Monday, June 18., and Aug. 8., for cattle and cheese.

**SHERBORNE**, or **SHERBOURN**, a market-town and par. of England, co. Dorset, hund. Sherborne; on the Ivel, which divides the town into two parts, Sherborne and Castleton, 16½ m. N. by W. Dorchester, and 110 m. W.S.W. London. Area of par. 4,900 acres. Pop., in 1831, 4,075. Sherborne is finely situated, partly on the acclivity of a hill, and partly in the fertile vale of Blackmore. It is compactly built; its principal streets, running E. and W., are crossed by smaller streets in a contrary direction. It was made a bishop's see in the 8th century, and continued such till 1075, when the see was removed to Salisbury, and Sherborne cathedral became an abbey church. Portions of the abbey, including the refectory, &c., still remain; but it was in great part destroyed by fire in the time of Henry VI. The church, however, chiefly rebuilt after that event, still exists, and is the modern par. church. It is a building of very different dates, but mostly in the perpendicular style; the S. porch is Norman. The groining is generally rich and good, and in the interior are several ancient monuments. (*Rickman's Gothic Architecture.*) The tower is upwards of 150 ft. in height; in it are 6 bells, the largest of which, weighing upwards of 3 tons, was presented by Cardinal Wolsey. The living is a vicarage in the gift of the crown, worth 260l. a year. Castleton (so called from the remains of an ancient castle, held by the royalists in the wars of Charles I.) is a separate living, a perpetual curacy, in the gift of Earl Digby, worth 81l. a year.

The Wesleyans, Independents, Friends, &c., have meeting-houses. The buildings of the free grammar-school, founded by Edward VI., adjoin the church, and are built round 3 courts, 2 of which are used as playgrounds. They comprise a good house for the master, formed of the ancient lady chapel, with upper and lower school-rooms, dining-hall, library, numerous dormitories, &c. This school should have, according to its charter, 20 governors, and has an annual income, from rents, &c., of near 900l. The headmaster has a salary of 125l. a year, with a house, and a fee of 1l. is. from each boy on entrance, and the like sum annually; the under-master has 100l. a year and a house: both masters must be university graduates, and members of the church of England, attendance on the service of which is compulsory on the pupils. Subordinate masters are also engaged; some for teaching writing and arithmetic, which are paid for separately. The course of instruction is principally modelled on the Eton system, though some deviations from it have latterly been introduced. In 1836, there were 43 boys on the foundation, and 86 private pupils of the masters. This school has 4 exhibitions at the universities of 60l. a year each, which may be granted for 4 years to pupils who have already been 4 years on the foundation; but these exhibitions have not always been filled up. Sherborne has an almshouse founded by Henry VI., which had, in 1836, 24 aged inmates, and an income of 666l. a year. There are numerous other charities, including Lord Digby's school

for girls, national and Lancasterian schools, &c.; and the par. authorities have the privilege of keeping three boys at Christ's Hospital, London, on the produce of lands left for the purpose in 1670. (*Charity Commissioners' Thirtieth Report*, pp. 104-132.)

In the immediate neighbourhood is Sherborne Castle, the seat of Earl Digby, built by Sir W. Raleigh. The mansion is in the form of the letter H; the body, 4 stories in height, having hexangular towers at the 4 angles, which are united with as many wings. It has some antique tapestry, and fine paintings. The park comprises 340 acres, and some of the finest oaks in the co. A bridge of 3 arches over the Ivel leads to the house. Pope was a frequent visitor at Sherborne Castle; and on a monument in the church is inscribed his beautiful epitaph in memory of his young friends, the Hon. Robert Digby and his sister Mary.

Sherborne has some silk and woollen fabrics; but these, as well as other branches of industry formerly carried on in the town, have greatly decayed. It is within the jurisdiction of the county magistrates. Assizes were regularly held here till the reign of Edw. IV., but have since been only occasional. General quarter sessions are held here on the Tuesday after Easter. Though not a modern par. bor., Sherborne sent mems. to the H. of C. in the reign of Edw. III. Market-days, Tuesday, Thursday, and Saturday; fairs, May 22., July 18. and 26. (usually), and Oct. 14., chiefly for cattle and pedlery.

**SJETLAND ISLANDS.** See ORKNEY AND SHETLAND.

**SHIELDS (NORTH).** See TYNEMOUTH.

**SHIELDS (SOUTH)**, a par. bor., market-town, sea-port, and township of England, co. Durham, E. div. of Chester ward, par. Jarrow, on the S. bank of the Tyne, near its mouth, and directly opposite North Shields, about 8 m. below Newcastle, and 16 m. N.N.E. Durham. Area of par. bor., 1,760 acres. Pop., in 1831, 18,756, exclusive of 2,216 absent seamen. This, and its sister town on the opposite bank of the river, may be regarded, in some measure, as the out-ports of Newcastle, their pop. and importance having grown up with the increasing magnitude of the coal trade and commerce of the latter. Its lower part consists principally of a narrow, crooked, and inconvenient street, extending for nearly 2 m. along the river; but the streets in the upper part of the town are wider and better built, and lighted with gas. The principal edifices and institutions are the town-hall, also used as an exchange, a neat building in the centre of a spacious market-place; a theatre, a scientific and mechanical institution, charity-school, dispensary, and the various places of worship. The church, dedicated to St. Hilda, is of considerable antiquity, but has been frequently repaired and modernised. The living is a curacy, in the gift of the dean and chapter of Durham, worth 330l. a year nett. There are chapels for various dissenting sects, to most of which are attached Sunday-schools, and various charities, and benevolent societies. In the town-hall petty sessions are held twice a month, besides courts leet and baron by the dean and chapter of Durham, as lords of the manor. Although the appearance of South Shields has little to recommend it, and its buildings are far from imposing, yet it is a place of much importance. The river Tyne is here about two thirds the width of the Thames below London Bridge; and the vessels which belong to or rendezvous at N. and S. Shields are disposed in tiers on each side, as in the port of London. The town is rapidly increasing; a considerable quantity of ground is marked out for building in the E. and S. directions, and no doubt can be entertained that if land, upon a freehold tenure, could be procured, the rate of increase would be much more rapid, and the scale of the buildings greater. The whole of the chapelry is the land of the dean and chapter of Durham. South Shields had formerly many salt-pans, and an extensive manufacture of salt; but this has been abandoned, and ship-building is now the staple business of the town, and is very extensively carried on, 12 ships, of the burden of 2,698 tons, having been built in 1840. It has, also, very extensive glass-works, a pottery, a coal mine (which may be said to be in the town), and manufactories of soda, alum, &c. (*Boundary Report.*) Still, however, the main dependence of the town is on the coal trade of the river. Indeed, most of the large colliers belonging to Newcastle load at South Shields, the coal being brought down the river in lighters, or keels; and it is said that as many as 500 vessels are frequently seen lying together in the haven. The port is included, with that of N. Shields, in the port of Newcastle, but there belonged to it specially, in 1840, 354 ships. The town communicates by the Brandling Junction Railway with the railway from Newcastle to Carlisle. The Reform Act conferred on South Shields the privilege of sending one mem. to the H. of C. The par. bor. comprises the townships of South Shields and Westoe. Reg. electors, in 1839-40, 686.

Mr. Greathed, of this town, invented the life-boat, the first being built here by a subscription in 1750. Markets

on Wednesdays; fairs, last Wed. in April and first in May, last in Oct. and first in Nov.

SHIRAZ, the second city of Persia, prov. Fars, or Persia Proper, formerly the cap. of the empire, in a valley 115 m. N.E. Bushire, and 220 m. S.S.E. Isfahan; lat. 29° 36' N., long. 52° 44' E. Pop., variously estimated at between 50,000 and 40,000. Shiraz has always been celebrated for the beauty and fertility of its neighbourhood, which has been warmly eulogised by the poet Hafiz, a native of the city. It is surrounded by gardens, and had, till lately, an imposing aspect from a distance; but this is said to be no longer the case, its domes and minarets having been levelled with the ground by the earthquake of 1824. Morier makes Shiraz nearly 4 m. in circ., but says that 1-3d part of its buildings to the S.E. are in ruins. It is surrounded with pretty high walls, flanked with round bastions, and has 6 gates, each flanked with 2 towers. "On entering the city, the houses, which are in general small, together with the narrow filthy streets, give the stranger but a mean idea of the second city of the empire. The great bazaar, or market-place, built by Kerim Khan, forms, however, a distinguished exception to this general remark. It is about ¼ m. in length, made of yellow burnt brick, and arched at the top, having numerous skylights, which, with its doors and windows, always admit sufficient light and air, whilst the sun and rain are completely excluded. The ark, or citadel, in which the begler-beg of Fars resides, is a fortified square of 80 yards. The royal palace within is far from being an elegant structure; and some pillars, its greatest ornament, were removed by Aga Mahomed Khan, to adorn his palace at Teheran." (*Kinnier's Persian Empire*, 62, 63.)

Shiraz seems to be rapidly hastening to decay; and most of its public structures, once very numerous, are already in a ruined or neglected state. The principal mosque is a very large edifice, having been the palace of Atabeg Shah, its founder. When visited by Morier, it had 15 considerable mosques, besides many others of inferior note, 11 *medressahs*, or colleges, 14 bazars, 13 caravanserais, and 26 *hummums*, or baths, &c. The principal college has upwards of 100 rooms; but it, as well as most of the others, is now nearly abandoned by students. Within the walls of the city are numerous Mussulman tombs. The climate was formerly distinguished for salubrity, but it has been materially changed for the worse in this respect since last earthquake. The heat of summer is excessive, rising sometimes to 110° Fahr. in the shade. (*Morier*, ii. 97—113.) The water of Shiraz, owing to the neglect of the city authorities, is also very bad.

About ¼ m. from the town is the tomb of Hafiz, the Anacreon of Persia. It stands within a quadrangular inclosure, and consists of a block of marble on which two of the poet's odes are sculptured, with the date of his death. His works are not, as has been stated, chained to the tomb, but a copy of them is kept in an adjacent chamber. Adjoining are the stream of Rocknabad, and the bower of Mossella, so celebrated in the verses of the poet; the former consisting merely of a small brook of clear water, not more than 2 ft. wide; while of the bower of a shrub remains, and its site is only marked by the ruins of an ancient tower. The celebrated garden of Jehan Nama, near the tomb of Hafiz, is a walled enclosure about 200 yards square, laid out in walks bordered with cypress trees, and watered by a variety of marble canals and artificial cascades. This, and many other gardens in the neighbourhood, are ordinary places of resort, where the citizens chat, smoke, and drink coffee. The tomb of the poet Saadi is also in the vicinity of Shiraz, with various conventual buildings for dervishes, &c.

Shiraz is celebrated for its wine. The principal vineyards are situated at the foot of the mountains to the N.W. of the town, where the soil is rocky, and the exposure extremely favourable. It would appear, however, that the culture of the vine has degenerated; and whatever may have been the case formerly, little care is now taken in the preparation of the wine. It is of very various qualities; but the best of the white varieties is certainly inferior to good Madeira, and the best varieties of the red (ruby wine of Hafiz) are not unlike tent, and seem to have but slender claims to the praises that have been lavished upon them. (*Henderson on Wines*, 365.) The produce of wine may amount, in all to from 80,000 to 100,000 galls, of which from 10,000 to 15,000 galls. may be exported to India, Bagdad, Bussorah, &c. The commerce of the city is still rather extensive; it is principally with Bushire, Yezd, Isfahan, and the cities in the N.W. of Persia. From Bushire, the chief imports are spices, Chinese and Indian goods of all kinds, iron, lead, quicksilver, glass wares, woollen cloths, muslins, linens, arms, ammunition, cutlery, and other European manufactures. These goods, with salt from the neighbouring lakes, are sent to Isfahan, Teheran, Yezd, &c., in exchange for the manufactures of those cities and other products. The exports to Bushire consist principally of wine, rose water, and attar of roses; assafoetida, dried fruits, silk, goats'

hair, Caramanian wool, saffron, drugs, horses, orpiment, madder, and tobacco. The trade between Shiraz and Bushire employs about 2,000 mules. (*Rich's Journey to Persopolis*, p. 265.)

Shiraz has no vestiges of remote antiquity, and was probably not founded till after the propagation of Mohammedanism. It had become a populous town in the 10th century, and soon afterwards it was surrounded with walls. Its greatest benefactor, however, appears to have been Kerim Khan, who reigned in the latter half of the 18th century; since his death it has gradually declined. (*Kinnier's Persian Empire*; *Waring, Alexander, Morier, Porter, Osusky, &c.* in *Mod. Trav.*, xii.; *Rich's Journey to Persopolis*, &c.)

SHOREHAM (NEW), a market-town, sea-port, and par. of England, co. Sussex, rape Bramber, hund. Fishergate, at the mouth of the Adur, here crossed by a long wooden bridge, about 1 m. from the English Channel, and 6 m. W. Brighton, with which town it has been since 1840 connected by a railroad. Area of par., 170 acres. Pop., in 1831, 1,503. New Shoreham appears to have risen on the decay of Old Shoreham, now an insignificant village about 1 m. distant, but formerly a place of some importance. The town is built in a singular manner; and near its centre is the market-house, supported on Doric pillars. The parish church is the remaining portion of a large cross church, of which nearly all the nave has been destroyed; it has various portions of fine late Norman gradually running into early English forms and details. (*Richman's Gothic Architecture*, p. 248.) The interior is remarkable for elegance and richness. The living is a vicarage, worth 1271. a year, in the gift of Magdalen College, Oxford. Here are meeting-houses for Independents and Wesleyans; a national school, &c.

The town stands on the Brighton and Chichester turnpike road, which now crosses a suspension-bridge, recently built by the Duke of Norfolk over the Adur. Shoreham has only a tide-harbour, but it is the best on this part of the coast; and having 18 ft. water at spring-tides, it is sometimes frequented by ships of considerable burden. Ship-building is the principal business, and vessels of 700 tons have been built here. It has, also, a considerable general trade, the gross customs' revenue collected here in 1840 having amounted to 22,146. It is governed by two constables, chosen annually at the court-leet of the lord of the manor. It was a bor. by prescription, and sent 2 mems. to the H. of C. from 1298 down to 1771, when the electors, having been convicted of gross corruption, the rape of Bramber was incorporated with the bor. The latter, however, was also disfranchised by the Reform Act. Market on Saturdays. Fair, July 25., for pedlery, &c.

SHREWSBURY, a par. and mun. bor. and market-town of England, co. Salop, of which it is the cap.; nearly in the centre of the co., in a peninsula formed by the Severn, on two gentle declivities, 50 m. S. by E. Liverpool, 138 m. N.W. London. Pop., in 1841, 21,525. It is chiefly separated from the river by garden and meadow ground, skirted by a range of genteel houses, and its exterior appearance is from many points striking and majestic. The streets, as in most ancient towns, are irregular, and many of the houses have an antique appearance, presenting gables and overhanging stories to the road; but various improvements have been made of late years in the thoroughfares, especially in lighting, flagging, &c. The river is here crossed by two handsome stone bridges, built by subscription, called respectively the English and Welsh bridges: the former, completed in 1774, at a cost of 16,000*l.*, is 410 ft. in length, and consists of seven semicircular arches; the other, or Welsh bridge, finished in 1795, at a cost of 8,000*l.*, is 266 ft. in length, and has five arches. Adjoining the latter is a quay and warehouses.

Among the chief public buildings are the royal free grammar school (see below); the town and co. hall, from a design by Sir R. Smirke, cost 12,000*l.*; it is a handsome building, and affords excellent accommodation for the assize business; the market-house, built in the reign of Elizabeth, and unequalled in point of ornamental decoration by any similar structure in the kingdom; a spacious and elegant music hall, with news rooms, &c.; the co. gaol and bridewell for the town, near the castle, built on Howard's plan in 1793, at an expense of 30,000*l.*; the Doric column, at the entrance to the town from London, in honour of Lord Hill, 116 ft. in height, surmounted by a colossal statue of his lordship, cost 5,573*l.*, raised by a subscription; a neat infirmary, 170 ft. in length (established in 1745), and rebuilt in 1830 at a cost of 18,736*l.*; the house of industry, on the S. bank of the Severn, for the poor of the six parishes of Shrewsbury, finished for a foundling hospital in 1765, cost 12,000*l.*; the theatre, rebuilt in 1834, on the site of the royal residence of the princes of Powysland; a butter and cheese hall in Castlefordgate, and a new savings' bank.

Shrewsbury has nine churches, most of which are embellished with rare and beautiful specimens of stained

glass. The new church of St. Chad is a handsome modern structure, formed by the intersection of two circles, with a tower and porch attached; the smaller of the circles being occupied by a grand staircase, and the larger one, 100 ft. in diameter, being the body, chancel, &c. of the building. St. Mary's, a cross church, of Norman and early English architecture, has a spacious chancel and chantry chapels, and a fine tower surmounted by a spire, one of the loftiest in the kingdom. The abbey church, the W. portion of a Benedictine monastery, founded by Roger de Montgomery, first earl of Shrewsbury, in 1083, displays many curious features of Norman architecture, combined with the earlier pointed style: the great W. window of the tower is only equalled by that of York cathedral: the aisles contain several fine old monuments, and opposite the S. entrance is an elegant octagonal stone pulpit: the interior forms a beautiful oriel, the roof being vaulted by eight delicate ribs: it formerly stood in the refectory. St. Giles's is a small but handsome edifice, built in the early part of the 12th century. St. Alkmund's was rebuilt in 1795, in the modern Gothic style, with the exception of the tower and spire, 184 ft. in height, which are singularly elegant. St. Julian's is a plain oblong building of brick, rebuilt in 1749: the tower belonged to the old church. St. George's, St. Michael's, and Trinity churches, have been erected during the last 10 years. The first is of freestone, and cruciform, in the lancet, or early pointed style. The two latter are of brick, in the Doric style, affording ample accommodation in free-sittings. Some of the parishes extend into detached parts of the adjacent country, where there are four chapels of ease belonging to St. Mary's, and one to St. Chad's.

Besides the churches, there are places of worship for Roman Catholics, Wesleyan Methodists, Independents, Baptists, and Unitarians, with attached Sunday-schools; and a meeting-house for the Society of Friends. A large national school, founded in 1778, is attended by about 350 children of both sexes, and nearly an equal number of boys are instructed in a Lancasterian school. Allat's charity-school provides clothing, instruction, and an apprentice-fee, for 30 children of each sex. Bowdler's school, in the par. of St. Julian's, was established in 1724 for a similar purpose; and in the suburb of Frankwell, across the Welch Bridge, is an hospital, founded in 1734, which, besides supporting 12 aged people of each sex, furnishes instruction to 25 boys and 25 girls of Frankwell. There are several almshouses belonging to different foundations, and attached to particular par.

The most distinguished public charity of Shrewsbury, however, is the free grammar-school, founded and endowed by Edward VI., but greatly enlarged by Queen Elizabeth. This school, prior to the close of the last century, had, owing to certain defects in the original rules and ordinances, fallen to decay; but in 1798 an act was passed "for the better government and regulation of the free grammar-school of Edward VI.," by which the management of the school was vested in the bishop of Lichfield and Coventry and 13 trustees or governors, one of whom is the mayor for the time being. At the same time, the number of masters on the foundation was reduced from four to two, and their appointment was vested solely in St. John's College, Cambridge. The income arising from the endowment is about 2,600*l.* a year, besides which it confers several advantages on its *alumni* at both Universities, viz. four exhibitions of 70*l.*, and four of 15*l.* each, at St. John's, Cambridge; four of 60*l.* each at Christ Church, Oxford; one of 100*l.*, and three of 25*l.* each, either at Oxford or Cambridge; three contingent exhibitions; and six scholarships, with one bye-fellowship at Magdalen College, Cambridge. Prizes are annually awarded to merit; and to the best scholar proceeding to college is given the Sidney gold medal, having on its obverse the bust of Sir Philip Sidney, who, with his friend Fulke Greville, afterwards Lord Brook, the poet, was educated in Shrewsbury School. During the present century the school has attained high celebrity, from the learning and talents of its master and (afterwards) visitor, Dr. Butler, late Bishop of Lichfield and Coventry. In consequence of the success of his pupils in competitions for prizes, exhibitions, and other honours, at the universities, the sons of the gentry have been sent here from all parts of the kingdom, and the establishment had, for many years past, comprised, independently of the free scholars (who must be sons of burgesses), many pupils paying handsome sums to the masters for board, lodging, and instruction: in fact, few public schools in England are superior to that of Shrewsbury. The school-house, erected in 1630, on the site of a more ancient wooden building, is a lofty structure of freestone, forming two sides of a court, the third side of which is formed by the library and chapel: a court is entered by a gateway, having columns on each side, with a Greek inscription over the arch. Two large houses belonging to the masters, contiguous to the school, comprise every accommodation for boarders; and there are large play-grounds in front and at the back of the school.

The town has 4 weekly newspapers; a literary and philosophical society; a mechanics' institute, and a public library with nearly 6,000 vols.; the assembly-rooms and theatre are well attended during winter; and races are annually held in the neighbourhood. On the S. side of the town is one of the most celebrated promenades in the kingdom, called the Quarry. It is formed in meadow ground gradually sloping to the river; along which extends a graceful avenue of lofty lime trees, 640 yards in length.

Shrewsbury was formerly of considerable importance as a mart for flannels from Welshpool, Newtown, &c.; but this branch of trade is nearly extinct. It has, however, a large factory for spinning flax, with some smaller factories, and a large iron foundry, the whole furnishing employment to several hundred persons. The prosperity of the town, however, does not depend solely on its trade, as it is a favourite place of resort for persons of small income, or who have retired from business. The Severn, which even here is celebrated for its salmon, is navigable as far as Shrewsbury by vessels of from 30 to 60 tons, and a canal to Wombridge opens a communication with the coal districts of Staffordshire. (*Mun. and Parl. Bound. Rep.*) The banking establishments of Shrewsbury comprise various private banks and joint-stock banking companies, besides a savings' bank. The vicinity being a good barley country, the malting business is carried on to a considerable extent.

Shrewsbury, which has received many royal charters, especially from Richard I. and Charles I., is divided into 5 wards, and is governed by a mayor and 5 other aldermen, with 30 councillors. Corp. sworn in, 1839, 1,669. Quarter and petty sessions for the bor. are held here under a recorder, and there is a court of requests for the recovery of small debts. The Lent and summer assizes are held here, as well as the quarter-sessions for the co. Shrewsbury has sent 2 mems. to the H. of C. since the reign of Edward I., the right of election down to the Reform Act being in burgesses paying scot and lot, and not receiving alms or charity. The electoral limits were enlarged by the Boundary Act, so as to include 1 entire par., and parts of 2 others, with the whole bor. Reg. electors, in 1839-40, 1,865. Markets on Wednesday and Saturday: fairs on the second Tuesday and Wednesday in each month, for cattle, horses, cheese, and butter.

Shrewsbury is supposed to have been built after the Roman station *Uriconium* had been destroyed in the 5th century. Willian the Conqueror gave the town and surrounding country to Roger de Montgomery, one of his followers, who built here a strong baronial castle, the keep of which still remains, being converted into a modern dwelling-house. In 1102 the castle and property were forfeited to the crown. Shrewsbury, from its situation close to Wales, was the scene of many border feuds between the Welsh and English; and, in 1277, Edward I. had his quarters here. On the 21st of July, 1403, a desperate battle was fought near the town, between the royal army, commanded by Henry IV., and that of the rebel Earl of Northumberland, under the command of the famous Lord Percy, surnamed Hotspur: the death of the latter, by an unknown hand, decided the victory in the king's favour; the loss on both sides was immense. During the wars of the Roses, Edw. IV., after the defeat and death of his father, Richard Duke of York, raised an army among the townspeople, with which he defeated the opposite faction at Mortimer's Cross. In the war between Charles I. and the parliament, the inhabs. warmly espoused the cause of the former; but in 1654 the town yielded to the parliamentary troops under Col. Mitton, and the fortifications were destroyed. Dr. Taylor, the learned editor of "Demosthenes," and the author of "Elements of the Civil Law," was the son of a barber of this town, where he first saw the light in 1703. It was, also, the birth-place of Dr. Burney, the author of the "General History of Music." The surrounding country is pletrenous and highly cultivated, the plain extending every way for about 13 m., beyond which are lofty ranges of hills. About 22 m. from the town is Boacobel House, where the Penderel family concealed Charles II. after his defeat at the battle of Worcester. (For further particulars the reader is referred to *Owen's Blackway's History of Shrewsbury; Pidgeon's Memorials of Shrewsbury; Corp. Reports; and Private Information.*)

#### SHROPSHIRE. See SALOP.

SHUMLA (the an. *Marcianopolis* ?), a city and strong military position of Turkey in Europe, being, in fact, one of the keys of Constantinople, on the N. declivity of the Balkhan (an. *Mons Hæmus*), on the great road from Constantinople to Rostchuk, 63 m. S.E. the latter; and 230 N.N.W. the former. Pop., according to Boué, 20,000. In a military point of view, Shumla is to be regarded as a vast entrenched camp. It occupies the declivity of a gorge in the mountains, which incloses it on three sides, like a horse-shoe; and on the fourth side, which descends into the plain, it is protected by a small hill on which is a strong redoubt. The space occupied

by the town is about 3 m. in length, by 2 m. in breadth. In the last century it had pretty strong walls; but these have been all but destroyed, and it is now merely surrounded by a ditch. It is, however, defended by some outworks and by a citadel, which has been greatly enlarged and strengthened since 1836. Its real defence consists, however, in the strength of its position: the plain to the N. of the town, on which the attacking army must encamp, is exceedingly unhealthy; and the surrounding mountains being steep, separated by deep rocky ravines, and covered with thick brushwood, which affords excellent cover for troops, Major Keppel, and other military authorities, appear to think that, if well defended, it would be all but impregnable. The Russians attempted to take Shumla in 1774, 1810, and, lastly, in 1828; but they failed on every occasion. Its principal defect, in a military point of view, is the great number of troops required for its effectual defence; and the fact, as shown by the Russians in 1829, that it may be turned.

Shumla is intersected by a rivulet, and is divided into the upper and lower towns. The former is principally inhabited by Turks; it has fine new barracks, numerous mosques, covered with tin and copper, and which is unique in Turkey, a town clock which strikes the hours, with a bell, &c., introduced by a pacha, who had been in Russia. The lower town, in which the Jews and Christians reside, is unhealthy, from, as is said, the influence of the adjacent marshes, but more probably from the filth of all sorts thrown into the rivulet which flows through the town. The thimn and braziers of Shumla are the best in Turkey, and supply Constantinople with their wares. It has also some manufactures of silk and leather; and ready-made clothes are manufactured in large quantities for sale to the merchants of the capital. It is the residence of a pacha and a Greek archbishop. (See *Keppel's Journey across the Balkan*, &c., i. 351. &c.; *Bond, Traqué d'Europe*, ii. 336., &c.)

SHUSTER, a city of Persia, prov. Khuzistan, on the Karoon (anc. *Eulatus*?), 165 m. S.W. by W. Isfahan, and 50 m. E.S.E. Shus, with which city it has disputed, though, as generally supposed, unsuccessfully, the distinction of representing the an. *Susa*. \* Lat. 32° N., long. 48° 59' E. It was formerly the cap. of the prov.; but having been depopulated by the plague in 1832, Dezfoul is now the cap. It may still, however, have 15,000 inhabs. (*Ravlinson*.) According to Col. Chesney "Shuster is about the size of Shiraz, and contains from 10,000 to 12,000 houses, all on the left bank of the Karoon. The town spreads E. from the river in a semicircular form, covering undulating ground, surrounded in its whole circuit by a wall of unburned bricks, and washed by an artificial canal on one side, and the Karoon on the opposite." The houses are principally of stone. The canals, dykes, &c., about the town are extensive, but ill kept. Water is conveyed to all parts of the city by petty aqueducts. The ruins of a castle exist on a height near the remains of an ancient bridge, carried away by a flood in 1832. There are no remains at Shuster that show it existed prior to the Sassanian dynasty (*Ravlinson*); but on the opposite bank of the Karoon there are numerous chambers excavated in the rock, and N. of the city walls are the traces of a much more ancient town, which appears to have extended on both banks of the river, being in this respect different from the anc. *Susa*. (*Chesney, Ravlinson, &c. in Geog. Journ.*, iii. and ix.) The inhabs. formerly manufactured large quantities of woollen stuffs, which they exported to Bussorah, in return for Indian commodities brought from thence. (*Kincaid's Pers. Empire*, p. 97.)

SIAM (called by the Birmese *Yoodra* or *Yuthia*), an extensive country of India-beyond-the-Brahmaputra, comprising, with its dependent states, most of the central and S. parts of that peninsula; extending between the 6th and 20th degs. of lat., and the 104th and 106th of E. long.; having N. the Laos country, E. the emp. of Anam, W. the Birmese emp., the British provs. of Tenasserim, and the Indian Ocean, and S. the Gulph of Siam, which it encloses on three sides. Its area has been very variously stated, but, according to Crawford, it amounts to 150,000 sq. m. Its pop. has been estimated, though on very vague and unsatisfactory data, by Crawford, at 2,790,500, and by Malcolm at 3,000,000; of whom, probably, 1,500,000 are native Siamese, 800,000 Shans, 250,000 Malays, Peguans, &c., and 450,000 Chinese settlers; but other authorities estimate the population at from 6,000,000 to 8,000,000.

**Physical Geography.**—The central part of this kingdom consists of the fertile valley of the Me-nam, one of the principal rivers of S.E. Asia; and the prov. of Chantillon, on the E. side of the Gulph of Siam, is also very fruitful; but, with these exceptions, most part of the country, in so far at least as it is known to Eu-

ropeans, is mountainous and rugged. The mountain chain which traverses the Malay peninsula separates Siam-proper on the W. from the valley of the Than-lweng or Saluen river, sometimes rises to the elevation of 5,000 feet; and a similar chain (the height of which, however, has not been ascertained), shuts it off on the E. from its Cambodian province of Batabang. The only navigable rivers of any consequence are the Me-nam, the Me-kon or river of Cambodia, and the Than-lweng. The last two belong only partially to Siam, and are noticed in Vol. I. of this work (p. 102, and 376.). The Me-nam or Mel-nam (mother of waters) runs, on the contrary, through the heart of Siam, the principal towns of which are situated on its banks. According to native accounts, the Me-nam has its origin in the table-land of Yun-nan, whence it flows generally in a S. direction to the head of the Gulph of Siam, entering the latter near lat. 18° 30', and long. 101° E., after a course roughly estimated at 800 m. It is navigable for small boats as far as Changnai, or Zimney, and large vessels ascend to Yuthia, the old cap. of Siam. In its progress it encircles several islands; and at Bangkok, about 15 m. direct from the sea, it divides into three separate channels. Only the most easterly of these, or Pak-nam river, is navigable for large ships, the others being obstructed by shallow bars at their mouths; and even the Pak-nam branch has a bar 10 or 12 m. broad, with but 14 fathom water at low tide; so that, even when lightened, vessels entering or leaving the river not unfrequently get aground, though, the bottom being soft mud, they sustain no injury. (*Malcolm*, ii. 130.) The Me-nam, its numerous tributaries, and the other rivers of Siam, annually overflow the country in July and the succeeding months.

**The Climate**, except in the marshes left after the inundations, is usually salubrious, though the smallpox and cholera sometimes make great ravages. At Bangkok the mean tem. of the year is about 83° Fah.; the heat is, however, not of an oppressive character, and the annual range of the thermometer is stated to be only about 13 degs. What is called the cool season lasts from Nov to Feb.; March, April, and May constitute the hot season; and the wet season continues during the rest of the year.

**Natural Products, &c.**—Iron is found in the mountain ridges on either side the valley of the Me-nam; there are also mines of tin, copper, and lead; and the precious metals are procured in small quantities. But the mineral products of the country are but little known or explored.

Siam is, perhaps, the cheapest country in the world for rice, which is commonly under 2s. and often costs only 1s. per cwt. This is ascribable principally, no doubt, to the natural richness of the soil, and the fact of its being annually overflowed by the Me-nam, or Nile of Siam. *L'inondation annuelle fait à Siam la sureté et l'abondance de plusieurs autres.* (*La Loubère, Voyage à Siam*, i. 53.) No doubt, however, the extraordinary cheapness of rice is, in part, also, owing to the lowness of the land tax, which, as estimated by Mr. Crawford, is for rice land only about 1s. 3d. per English acre, or from one sixth to one tenth part of the produce, instead of from one fourth to a half, as in British India.

Here, as in most Eastern countries, government is supposed to be the principal proprietor of the soil, but the tenants who pay the land tax run but little chance of being ejected; it is said, however, that gardens, orchards, and houses, are viewed as the private property of the occupants. The Chinese are at once the principal cultivators and leaders in every branch of industry.

Besides rice, Siam yields nearly all the most valuable products of the East, and, under an intelligent government, might furnish vast quantities for exportation. Sugar, pepper, tobacco, the finest fruits, are principal articles of culture; and the forests, which cover a large proportion of the surface, produce teak, sandal, sapan, rose, eagle, and a variety of other variegated and burnished woods, with numerous gums, &c. The teak is said by Hamilton to be of the same quality as that of Birmah; it is floated down 300 m. from the interior to the capital, and is there almost wholly employed in the construction of native junks, very little being exported. Iron, copper, tin, lead, and gold, are the principal mineral products; the gold is obtained by washings, the tin mostly from the tributary Malay territories. The wild animals are similar to those of Hindostan and the adjacent Ultra-Gangetic countries: the elephant is most abundant, and is extensively employed. A very rare, or white variety of the elephant, is sometimes found here, and is held in the highest estimation. Indeed, one of the titles of the Siamese monarch is, "lord of white elephants," several of which are maintained as state appendages at the royal court. "He who discovers one of these animals, is regarded as the most fortunate of mortals." The event is of that importance, that it may be said to constitute an era in the annals of the nation. The fortunate discoverer is rewarded with a crown of

\* Major Rawlinson contends, that neither of these cities is the representative of *Shusha*, the anc. cap. of Persia, which, he says, is to be sought for in the ruined city of *Susaa*, also on the Eulatus, but to the E.N.E. of Shus and Shuster. (See his researches in the *Geog. Journal*, ix. 85—93.)

silver, and with a grant of land equal in extent to the space of country over which the cry of the elephant may be heard. He end his family, to the third generation, are exempted from all sorts of servitude, and their land from taxation." (*Finlayson*, 154.) The rhinoceros is more plentiful in this than in most other countries: tigers, though inferior in strength to those of Bengal, are also common.

*Races of Inhabitants.*—The Siamese appear to be of the same stock with the Laos Shans, to whose country their traditions point as their original seat. They are characterised by a broad forehead, a hairy scalp descending so low as to cover, in some instances, the whole of the temples; the lower jaw is long, and remarkably full under the zygoma, so as to give a square appearance to the countenance. Eyes small and oblique; lips thick; mouth large; beard scanty; hair coarse, lank, and uniformly black; but that of the chin is softer and of a lighter colour than is usual among the Ultra-Gangtic nations, heightened among the upper ranks by a bright yellow wash. Limbs thick, short, and stout; trunk square; they have a strong tendency to obesity; average height of men about 5 feet 3 inches: they possess, says Mr. Finlayson, from whose valuable work we have taken these particulars, the frame without the energy of London porters. (*Mission to Siam and Hue*, 230.) Travellers agree in representing the Siamese as crafty, mean, ignorant, concealed, servile, and rapacious. Indulgence, as might be expected, is also one of their prominent traits. They have, however, some redeeming qualities: being exceedingly attached to their children, reverential to parents, temperate, and, except on great provocation, gentle in their manners. The upper classes, however, are offensively coarse, manifesting a total disregard for the feelings of others, and an unbounded arrogance. The Laos, or Shans, tributary to Siam, inhabit principally the N. part of the country, where they are divided into several tribes (see Laos). The Chinese settlers are mostly immigrants from the provs. of Canton and Fokien, and the island of Hainan. They resort to Siam unaccompanied by their families, intermarry with the Siamese, and adopt their form of religion, with most of their habits. (*Geog. Journ.*, iii. 292.) Each male above the age of 20 pays a capitation tax. The greater number of them are employed in trade, or in the tributary Malay states, in working gold and tin. At Bangkok there are a good many Cochinchinese and some settlers from Hindostan, most of whom are Mohammedians. The Portuguese Christians, or their descendants, of whom there may be about 2,000, are engaged in commercial pursuits, as interpreters, &c., and are mostly in indigent circumstances.

*Arts, &c.*—The Siamese have made very small progress in the useful arts; nor, under existing circumstances, can it well be otherwise. All mechanics who evince any skill are immediately seized upon, and made retainers of the king or of some person in authority, who employs them for life in some useless service of vanity or ostentation. Hence there is, as it were, a premium on barbarism, and labour is dear and difficult to procure. The ordinary mechanics are, in fact, usually natives of China or Cochinchina. In no one useful art have the Siamese ever attained distinction. They make no fabric that can bear to be compared with the cottons of Hindostan, the silks of Birmah, or the porcelain of China. Even in the fabrication of jewellery, a proficiency in which has been often remarked among ruder people, they exhibit little skill; and, in fact, their gold and silver trinkets, plate, and articles of zinc, tin, and brass, are all imported from China, or obtained from the Chinese settlers. It is through the ingenuity of the latter that the iron ore with which the country abounds has been of late years rendered available. At present a good deal of malleable iron is produced, and at Bangkok there are several extensive manufactories of cast-iron vessels; but these are wholly conducted by Chinese. The latter have also introduced the culture of sugar, now become a staple product, and have created a taste for commerce and the means of carrying it on. The cutlery and tools in use among the Siamese are of the rudest and simplest description; and, though the people fabricate arms, they have acquired no skill in the art, and fire-arms have always been supplied by Europeans. Even the coarse brown pottery in use is mostly made by Peguans. The art of dyeing is on the lowest scale, though the country abounds in the necessary materials; and printing silks and cottons is not practised by the Siamese in any shape or form. (*Crawford*, ii. 20–23.) Some Europeans have proposed to introduce steam-engines, saw-mills, cannon-foundries, the culture of indigo and coffee, &c.; but they have been always treated with distrust and violence, and their offers have been uniformly rejected, with the exception of those of a Frenchman, who, in the end, however, had to leave the country in disgrace, after having commenced the construction of an engine for boring guns! (*Crawford*, in *Geog. Journ.*)

Architecture is in the same low state as the other arts. The habitations in the alluvial grounds are all

raised on piles, as in the rest of India beyond the Brahmaputra, though on the higher lands piles are dispensed with. But the houses are nearly all of the same fragile materials, among which the bamboo and Nipa palm-leaf are the principal; and it is only in the capital or in the other towns that any are to be seen constructed of brick and mortar, and roofed with tiles. The temples, though surrounded with brick enclosures, consist chiefly of timber-work; and, though laboriously carved, gilt, and otherwise adorned, exhibit no taste. Edifices for public convenience and utility seem to have no existence; and neither piety, superstition, charity, nor interest, seems to have led the rulers of this country to construct bridges, wells, tanks, or caravanserais. The bridges, even at the capital, consist only of planks, and no where do we observe any attempt to construct an arch. The absence of public roads is not less remarkable. There are but two of any consequence in the kingdom; one from Bangkok to Yuthia, and another from Chanthon to Tung-gal. In the N. and on the Malay isthmus, elephants are used to convey merchandise across the narrow mountain pathways; but these animals are prohibited, except to a few favoured individuals, in most of the towns, and even in Bangkok wheel-carriages are unknown. But internal navigation is so extensive, cheap, and commodious, that in all the central part of the country it supercedes the necessity for roads.

*Commerce.*—The foreign trade of Siam is conducted chiefly with China, Anam, Java, Singapore, and the other British ports within the Straits of Malacca, with an occasional intercourse with Bombay and Surat, England and America. The most important branch by far of the foreign trade is with China. This is estimated to employ at least 200 junks annually, many of which are of 500 or 600, and some not less than 1,000 tons. They are all of Chinese built, though mostly constructed in Siam; some are owned by Siamese merchants, but many more by Chiuamen residing in Bangkok, and the crews are never Siamese. These vessels make but one voyage a year; going in one monsoon, and returning in the other. Most of them arrive at Bangkok in Dec. and Jan., but they continue to come from the more distant provs. till April, and sail from the Me-nam in June and July. Numerous small vessels keep up a constant intercourse with the coasts of the Gulf of Siam, and the neighbouring islands; and two or three Siamese ships, built on the European model, trade to Singapore. An artificial canal, kept in good order, connects the Me-nam with the Cambogia river; but the trade by it, as well as by Cochinchinese sea-going vessels, has been depressed of late years, owing to hostilities between Siam and Anam. Bangkok is the great emporium of trade; and, according to Malcom, it has the largest commerce, next to Canton, of any city not peopled by Europeans, or their descendants. The imports into Siam from China consist of earthenware and porcelain, spelter, quicksilver, tea, laksoy, dried fruits, raw silk, crapes, satins, and other silk fabrics, with nankeens, shoes, fans, umbrellas, writing paper, incense, and Chinese immigrants. From the Malay archipelago, and the countries to the westward, the chief imports are British and Indian piece goods, arms and ammunition from Europe, woollen cloths, a little glass-ware, and commodities suited for the Chinese market, as pepper, tin, dragon's blood, rattans, *biche-de-mer*, esculent swallow's nests, and Malay camphor. Besides these articles, the principal exports to China and elsewhere are sugar, cardamoms, eagle, sapan and rose woods, mangrove bark, cotton, ivory, stick lac, rice, aren nut, salt fish, the hides and skins of oxen, buffaloes, elephants, rhinoceroses, deer, tigers, leopards, otters, &c.; buffalo, ox, deer, and rhinoceros horns; bones, sinews, feathers, &c. Malcom, who visited the country in 1837, speaks of the practice of opium-smoking as very common, and on the increase in Siam. But, in 1839, the importation of opium was prohibited by the government, conformably, as is said, to the wish of the Chinese government. Since that time, a little trade in that article has been carried on with Siam. The trade in several of the most valuable products is a royal monopoly; but the trade in sugar and pepper, the two great staples of the country, is free: the exports of sugar being estimated at 10,000 tons, and those of pepper at 3,500 tons. In 1838, 16,169 cwt. of the former, and 23,759 lbs. of the latter, were imported from Siam into the United Kingdom.

Gold and copper are not used as money in Siam: the only coin is of silver, being merely a small bar turned in at the ends, and stamped on one side. Cowries are the ordinary medium of traffic, and 12,800 go to the tical, which is estimated to be worth 2s. 6d. The ordinary weights are the picul and catty; the former is the same as the Chinese, and divided into 50 catties of 2½ lbs. each. The Siamese fathom is about 6 ft. 6 in.: the sen, a land measure of 20 fathoms square.

The Government is an absolute monarchy, the sovereign being every thing, and the people nothing. The manners of the court, and the etiquette observed, seem to be nearly the same in the present day as they are de-

scribed by the earliest European travellers; and are of a more servile description than those, perhaps, of any other court in the East. The king, one of whose titles is "the God Boodh," is supposed by his subjects to be a deity, and is revered as such; an immeasurable distance being supposed to exist between him and the highest of the nobility. "The people," says Mr. Finlayson, "are governed by opinion, absurd and unjust, not by reason, by sense, or by kindness. The most degrading and brutal tyranny is mistaken for well-meaning patriarchal kindness; and the oppression of the multitude, and the grinding of the many, is regarded as the will of the Deity. No man either wishes for, or aspires to, freedom of thought or action; and tyranny has cast its roots so deep, that change would seem hopeless." (Finlayson, 158.) Next to the sovereign, the nobility absorb most of the legislative and executive power; there being, except in some cases of appeal, no establishments exclusively for judicial purposes. The Siamese have, indeed, written laws; but it frequently happens that the king, on his accession, publishes a new edition, with his own interpolations, though neither the original code nor the changes introduced appear to be much regarded by the administrators of the laws. The same chiefs who are charged with the military, civil, and revenue administration, are the only judges and magistrates. According to the laws of inheritance, a man must leave his property to his family in preference to strangers; but no claim of primogeniture is recognised, the children usually sharing equally. The nature of the marriage contract is much the same as in other eastern countries, polygamy being permitted, and divorces obtained without difficulty. A breach of the marriage vow is not visited with so severe a penalty as in Anam, but is usually expiable by a pecuniary fine. The penal code of Siam bears a strong analogy to that of China, especially in the liberal and indiscriminate use of the bamboo for the punishment of all minor offences. For crimes of magnitude, the punishments, as in Birmah, are of the most savage description; torture may also be applied to extort evidence. They have, also, the same sort of ordeals for determining the guilt or innocence of accused parties that were common in Europe during the middle ages. And La Loubère and Crawford mention that, in the event of goods being stolen, should suspicion fall on different parties, it is customary to administer emetics to them all; in which case, the person with the weakest stomach, or who vomits first, is held to be the culprit! (*La Loubère*, i. 334; *Crawford*, &c., *passim*.)

*Armed Force*.—Every male inhabitant, from the age of 21 upwards, is obliged to serve the state for four months a year. The following individuals are, however, excepted: members of the priesthood, the Chinese settlers, who pay a commutation tax, slaves, public functionaries, the fathers of three sons liable to service, and those who purchase exemption by a fine of from six to eight ticals a month, or by furnishing a slave or some other person not subject to the conscription, as a substitute. There is no standing army. The king has for a good many years made large annual purchases of muskets; and Mr. Malcolm estimates that he now possesses upwards of 80,000 stand of arms, besides a considerable stock of cannon. The principal force of the Siamese consists in their elephants; but when contrasted with Europeans, their army may be said to be contemptible. At Bangkok, there is a numerous navy of war-junks, galleys, &c., built on the Chinese model, and mounting heavy guns, manned by Chinese and other foreigners.

The *Public Revenue* is estimated by Crawford at about 3,145,000*l.* sterling a year; of which sum, the poll-tax and fines for non-service in the army may, perhaps, produce 2,500,000*l.*; the land-tax, 287,000*l.*; tax on fruit trees, &c., 65,000*l.*; on pepper, 50,000*l.*; on spirits and gambling, about 77,000*l.*; and the customs, 33,000*l.*, &c. But exclusive of the taxes paid in money or produce, the people are subjected to *corvées*, and other oppressive burdens. The collectors receive no salary, being remunerated by a tithe of the revenue realised; an arrangement which generates a variety of abuses. The receipts and expenditure are said nearly to balance each other; and there is seldom any large sum in the public treasury.

*Religion*.—The worship of Boodh is nearly universal in the countries lying E. of Hindostan; but the Buddhism of S. is very different from that of N. Asia.\* Gaudama is worshipped in Siam under the name of Somantha Codom. Every male Siamese must enter the priesthood once in his life, though he may quit it again at pleasure. The *talapouts*, or priests, live together in monasteries, sometimes containing several hundred individuals, endowed by the government or by wealthy persons. The Papal church has maintained missions in Siam for nearly 200 years; but, according to Malcolm, there are only about 2,200 R. Catholics in the country, including 800 Anamese, and several descendants of Portuguese. Neither do the American Baptist and other mis-

sions appear to have made many proselytes. (*Malcolm's S. E. Asia*, ii. 155—164.)

*Manners, Language, &c.*—In the articles ANAM and BIRMAH in this Dict., various details have been given respecting the manners and customs of Ultra-Gangetic nations, most of which apply to the inhabs. of Siam; though the latter are decidedly lower in civilisation than either the Anamese or Birman. They are less gross, however, in their eating than the former; and women are not so much degraded among them as among the latter. They are also more generally acquainted with reading and writing than the Birman. Both sexes dress nearly alike, and wear fewer clothes than almost any other semi-civilised people of the East; a cotton garment reaching downwards from the loins, with sometimes a scarf across the upper part of the body, usually completes the Siamese costume. Jewellery and trinkets are little used, but the teeth are always stained black. They are nearly as much addicted to gambling and cock-fighting as their Malay neighbours; they are also very fond of theatrical entertainments and music, in which last they display considerable skill. Their language is radically monosyllabic, and cognate with those of the Laos Shans and Anamese; but many words have been introduced into it from the Cambodian, a polysyllabic language, and the *Pali* or sacred tongue, which last the common dialect imitates in the form of its written characters.

As in other Asiatic countries, slavery is common, and some chiefs have hundreds or even thousands of slaves. Some of the conquered districts have been almost depopulated, to bring their inhabs. to Siam; and at all times an active slave-trade is carried on along the Birman frontier. Persons are sold into slavery for debt; and men may sell their wives and children at pleasure. A common custom is for the master not to support his slave, but to allow the latter to work for himself for 2 or 3 months, to supply necessaries for the rest of the year. Children inherit their parents' bondage.

*History*.—The Siamese are said to possess records which go back for 1,000 years; but little in their accounts possesses any interest till 1511, when the first intercourse of Europeans with Siam took place. The Portuguese and Dutch had traded with the Siamese for the best part of a century, when the first British ship went up the Me-nam in 1612. In 1683, Constantine Phaulcon, a Cephalaonian Greek, had found means to get himself raised to the dignity of foreign minister of Siam, and soon afterwards opened a communication with France. Louis XIV. sent an envoy (the celebrated M. de la Loubère, to whom we are indebted for an excellent description of the country) to Siam in 1685. The French were, however, expelled the country in 1690; since which time numerous wars, either aggressive or defensive, with the surrounding states, have been the most conspicuous events of Siamese history. (*La Loubère, Voyage de Siam*, 2 tomes, Paris, 1691; *Crawford's Embassy to Siam and Cochin China*, one of the best modern works on the Ultra-Gangetic nations; *Malcolm's S. E. Asia*, ii. 130—164; *Finlayson's Miss. to Siam*, &c.; *Chin. Rep.*, &c.)

SIBERIA, a vast territory of N. Asia, belonging to Russia, which *see*; and *see*, also, the article ASIA, I. 167.

SIBKIM, or SIKKIM, a state of N. Hindostan, tributary to the British, between the 26th and 28th degs. N. lat., and about the 88th E. long., having N. Tibet, E. Bootan, W. Nepal, and S. the Bengal territory. Area, about 4,400 sq. m. Pop. estimated at about 166,000. From its situation on the S. slope of the Himalaya, its geography, products, &c., are nearly similar to those of Bootan and Nepal, to which articles we beg to refer for its general description. It was placed under British protection in 1816. (*Hamilton's E. I. Gaz.*, &c.)

SICILY (an. *Sicilia*), the largest, finest, most important, most fruitful, and most celebrated island of the Mediterranean, constituting that portion of the kingdom of Naples entitled the *Dominio di la di Faro*, lies between lat. 36° 38', and 38° 18' N., and long. 12° 20', and 15° 40' E. It is separated from the S. extremity of Italy by the narrow Strait of Messina, only two miles across, and from Cape Bon in Africa by a channel 85 m. in width. It is of a triangular shape, and was hence, in antiquity, sometimes called *Triguetra*, but more commonly *Trinacria*, from its terminating in the three promontories of Boco (an. *Lilybæum*), Passaro (an. *Pachynum*), and Faro (an. *Pelorum*). It seems to have derived its usual name of *Sicilia* from the Siculi or Siculi, its earliest inhabs. Length, E. and W., about 215 m.; greatest breadth 150 m. Area, pop., subdivisions, &c., as follow:—

Intendancies (Valli).	Area in sq. m.	Pop. in 1831.	Pop. to sq. m.
Palermo - -	1,727	475,574	275.5
Messina - -	1,475	312,463	212.1
Catania - -	1,785	348,987	195.5
Syracuse - -	1,230	239,488	194.7
Cal. - Isetta -	1,532	168,369	110.0
Giardini - -	1,621	225,038	139.0
Trapani - -	1,047	173,287	165.5
<b>Totals</b> - -	<b>10,508</b>	<b>1,545,366</b>	<b>144</b>

\* An able sketch of Buddhism may be found in *Crawford's Embassy to Siam*, ii. ch. 2; and there is a comprehensive account of its principal tenets, by a Buddhist priest, in the *Ceylon Almanac* for 1855.

The Neptunian or Madonian chain of mountains, stretches from the Straits of Messina, at the N.E. extremity of the island, along its N. coast to Cape Boeo at its W. extremity. Some of its summits are of considerable altitude. It gives off several spurs to the S., which, with their ramifications, cover a considerable portion of the surface. But, exclusive of these, there are some mountains which are quite detached from and unconnected with any system. The principal of these is Etna, the most celebrated of European mountains, near the E. coast of the island, and by far the loftiest in Sicily, being not less than 10,872 ft. above the sea. (See ETNA.) There are some extensive plains: the principal is that of Catania, at the foot of Etna; the next in point of size being those of Milazzo, Terra Nova, Syracuse, and that extending along the S.W. shore for about 100 m. E. of Trapani. The rivers, though generally insignificant in point of size, are mostly celebrated in classic history or poetry. The principal is the Salso (an. *Himeria*), which, as well as the Platani, Belici, &c., discharges itself on the S.W. coast. The Giaretta (an. *Sinictus*) waters the plain of Catania. A great number of small brooks and torrents disengage on the N. coast; but none of the rivers is navigable, or otherwise available for the purposes of trade. The only lake worth notice is that of Biveri, or Lentini, in the plain of Catania.

Except in some low and marshy tracts, the air of Sicily is generally salubrious, and the climate, though rather hot, is, for the most part, delightful. Cold weather is sometimes experienced, but the severity of the winter is never such as to affect the verdure of the country. Ice and snow are never seen except on Etna, and the highest summits of the Madonian chain; but the summer heats, especially during the prevalence of the siccoeco, or S.E. wind, are often very oppressive. The range of the thermometer throughout the year at the level of the sea is from about 39° to 110° Fah.; its mean height being estimated by Smyth at 62° 5', and that of the barometer at 29.80. "Whilst the sun is in the northern signs, the sky, although it seldom assumes the deep blue tint of the tropics, is, nevertheless, beautifully clear and serene; but after the autumnal equinox the winds become boisterous, and the atmosphere heavy and dense; the dews and fogs increase, particularly on the coasts, and the rain falls in frequent and heavy showers." (Smyth, p. 4.) Sicily has, on various occasions, been subject to destructive earthquakes, which usually take place towards the end of winter.

The primary rocks in the mountains are principally granite, quartz, and mica. These are overlaid in many parts by limestone rocks, and most of the lower hills ranges are calcareous, abounding with metallic ores. The soil, though very various, is almost every where endowed with the greatest fertility, and has been famous alike in ancient and modern times for its extraordinary productiveness. Sicily was, in fact, the principal granary (*horreum*) of Rome. It is said by Livy to have been *Populæque Romanæ, pace ac bello, fletissimum annonæ subsidium*. (Lib. xxvii. cap. 5.) And the third oration of Cicero against Verres, or that entitled *De Frumento*, affords in every part the most conclusive proofs of the fertility of this fine island, and of the great importance of the supplies of corn which it furnished to Rome. In some of the valleys the soil consists of a rich loam, from 20 to 30 feet in depth! The decomposed volcanic products scattered over the surface of large portions of the country are also extremely fruitful, being suitable alike for the production of corn, wine and oil. Even at present, despite the wretched system of agriculture, Smyth says that the usual produce is from 10 to 16 times, and in favourable seasons, and on the best lands, 28 times the seed! Immense beds of sulphur are found in the central and S. parts of the island.

The vegetable products of Sicily embrace numerous tropical as well as European plants. The surface has been divided, according to its elevation, into the following five regions, each distinguished by its vegetation.

Regions.	Height.	Products.
	<i>Ft.</i> <i>Ft.</i>	
1. Sub-tropical	— to 600	Papyrus, sugar-cane, date and dwarf palm, olives, agrumi, &c.
2. Evergreen	600 — 2,000	Similar to those of Apennines, at same elevation.
3. Oak and chestnut	2,000 — 4,000	(Mountains not so thickly wooded as Italy.)
4. Beech wood	4,000 — 6,000	Maize, wheat, &c., to 4,500 ft.
5. Upper reg.	6,000 & above	Birch, juniper, &c. (See ETNA.)

Sicily was believed, in antiquity, to have been the native country of corn. (*Diod. Siculus*, lib. v.) Homer says of its early inhabitants:—

"Untaught to plant, to turn the glebe, and sow,  
They all their products to free nature owe.  
The soil until'd a ready harvest yields.  
With wheat and barley wave the golden fields;  
Spontaneous wines from weighty clusters pour,  
And Jove descends in each prolific shower."

Pope's *Odyssey*, lib. xi. lin. 121.

Agriculture, also, is said to have originated in the island under the auspices of Ceres. But (*quantum mutatus!*) there are now few, if any, countries in Europe in which that art is in so degraded a state. There seems every reason to think, from the number and magnitude of its cities, and other circumstances, that its population in antiquity must have been much larger than in modern times. Indeed, the fair presumption seems to be that it must then have amounted to at least from 3½ to 4 millions. And yet, notwithstanding this greater density of pop., it was, as already seen, able to export vast quantities of corn to Italy. It does not, however, appear very difficult to account for this melancholy change. After the overthrow of the Roman power, Sicily was occupied successively by the Greeks, Saracens, Normans, and French, that at length it became a dependency first of the crown of Spain, and more recently of that of Naples. It is to this dependence, and to the introduction of the feudal system by the Normans, that its backward state is principally to be ascribed. The multiplied abuses which grew up in Spain under the reign of Ferdinand and his successors of the Austrian line, flourished with equal luxuriance in Sicily, and have proved no less destructive of the industry and civilisation of its inhabs. than of those of Spain. The Neapolitan regime has been equally pernicious; and misgovernment, the abuses of the feudal system, insecurity, and unequal and arbitrary taxes, have here, as every where else, paralyzed industry and impoverished the people.

But the grand curse of Sicilian, as of Sardinian industry, will probably be found in the oppressive restrictions that have been laid on the exportation of corn. Down to a late period no corn could be exported without leave being obtained from the *Real Patrimonio*, a body that pretended to take an account of the crops, and which determined whether there were to be any exportation; and in the event of its being allowed, it issued, or rather sold, licenses to a few favoured individuals, authorising them to export certain specified quantities! Even had Sicily been ten times more productive than she really is, it is quite impossible that agriculture could have flourished under such discouragements. Luckily, however, these oppressive restraints have recently been abolished, and there are no longer any obstacles to the free exportation of corn. Oppressive taxes, the want of leases of a reasonable length, and of practicable roads, are at present, perhaps, the greatest obstacles to agriculture.

The property of the island was valued in 1811, when the English garrison and fleet occasioned a great demand, and high prices for produce of all kinds, and this valuation has been continued to this day, as the basis on which the land and house tax (*fondaria*) is levied. A rate of 7½ per cent. on this valuation was first charged, which was subsequently raised to 12½ per cent., at which it is now fixed. Owing, however, as is stated, to the fall in the price of agricultural produce since 1811, this tax is alleged by Mr. Macgregor to be more than equivalent to a duty of 25 per cent. on the produce of the soil taken at its present (1840) value, and to be a very great obstacle to improvement. We believe, however, that its influence in this respect, though considerable, has been much overrated; and that the backward state of Sicily is principally owing to other and different causes.

Though there be in Sicily a very considerable number of small proprietors, by far the greater part of the land belongs to the crown, the church, and the nobility, some of whom have very extensive and valuable estates. Down to a recent period these were held under a system of strict entail, and their occupiers, as well as those on the estates of the crown and church, usually held under triennial leases, and were in a state of feudal bondage, and subject to numerous exactions on the part of their lords. Under such circumstances, even though there had been neither restrictions on exportation nor a land-tax, the depressed condition of the peasantry, and the low state of agriculture, need not be wondered at. But we are glad to have to state that the dawn of a better day seems to have arisen, and that several important changes have lately been introduced. We have already noticed the removal of the restrictions on exportation; and in 1812 and 1838 laws were passed for the abolition of the feudal system, and the complete emancipation of the peasantry. And, notwithstanding the poverty and ignorance of the latter will hinder them from immediately profiting, to the extent that might be anticipated, from the passing of this law, it cannot fail, in the end, to be productive of the best effects. It was also enacted in 1819, that in future, on the death of any individual possessed of an estate in land, and having more than one son, the half only of the

estate shall descend to the eldest son, and that the other half shall be divided in equal shares among the other children. This law, which appears to have been framed on the model of that which regulates the succession to property in France, will probably have nearly similar effects.

In both countries the abuses of entails might have been obviated without running into the opposite extreme, and establishing a system that can hardly fail, in the end, to occasion the too great division of landed property.

The arable lands in Sicily have been roughly estimated to comprise about 3,700,000 acres; vineyards, 115,000 do.; vegetable and fruit gardens, 260,000 do.; woods and olive plantations, 1,125,000 do.; the remainder of the surface being mostly waste. Ploughs and most other agricultural implements appear to have undergone no improvement for centuries; and "a bunch of brambles, drawn by an ox, supplies the place of a harrow." (*Smith*.) The magnificent crops which are occasionally met with are wholly ascribable to the extraordinary fertility of the soil, and not to the labour or skill of the cultivators. In fact, such is the carelessness of the husbandmen, or such the difficulties resulting from the oppressions under which they have laboured, that, according to Mr. Macgregor, nearly a third part of the pop. have to depend for support on the fruit of the *cactus* (Indian fig, or *figuina*), found in the greatest profusion in most parts of the country. (*Report*, 46.)

We suspect, however, that there is a great deal of exaggeration in this statement; and, at all events, it is sufficiently certain that, independently of the changes already alluded to, there has of late years been a decided increase of the means of subsistence. The growth of pop., which increased from 1,660,267, in 1798, to 1,943,366, in 1831, being an augmentation of 283,098, is an evidence of this; and has, no doubt, been at once a cause and a consequence of the improvements which, though slowly, and almost imperceptibly, have begun to make their way in the island. At present (1842) the pop. is probably not under 2,100,000.

Exclusive of wheat and barley, hemp, flax, and cotton are raised with but little labour. The culture of the last is said to be extending of late years, especially in the neighbourhood of Mazzara. It is mostly short-stapled, and but little is exported, and that only to Naples and Trieste. It is probable, however, that by attention to its culture, and the introduction of improved varieties, its quality might be improved, and it might become an article of some importance. The sugar-cane was formerly a staple product of the S. shore of Sicily. But, owing to the introduction of cheaper sugar from the W. Indies and Brazil, the culture of the cane is now restricted to some small plantations near Avola, and will probably, at no distant period, be wholly abandoned.

The district round Marsala is the principal seat of the wine culture; and, thanks to the exertions of some English capitalists established in that city, the production of wine is become an important branch of industry, and it forms a principal article of export. (*See* MARSALA.) Vines are generally treated as in France, being cut low, and not lopped along other trees, as in S. Italy. But, except in the English establishments, little care is in general bestowed on the vintage: the wine-press is a very rude machine, and in some districts it is altogether wanting; the process of crushing the grapes being performed in large vats, by the treading of bare-footed peasants. Along the N. coast, the mountain slopes and valleys are almost wholly covered with olive groves; though elsewhere they are rare, and do not furnish sufficient oil for the tubs. But for the imperfections in the mode of its preparation, the oil of Sicily would be excellent. The olives, however, are permitted to hang on the tree till they come off with shaking, or beating with light canes; and they are then kept in vats till they get quite black, so that the oil becomes pungent and rancid, and, though fit for the lamp, is totally unfit for the table. It is only near the capital, and in a few other places, that a more improved process is followed. Lemons and oranges, which grow luxuriantly, are of excellent quality, well adapted for long voyages, and, when intended for exportation, are collected with more care than any other agricultural product. They are largely exported, and are, altogether, highly important. Almonds, pistachios, dates, madder, the *Sida* plant, hazel-nuts, the *Ricinus palm*, or castor-oil plant, saffron, tobacco, &c., might all be raised in any quantity; but their culture is, for the most part, neglected, or ill-conducted. The mulberry is grown in the vicinity of Messina, and in the N.E. part of the island; but the produce of silk does not exceed 400,000 lbs. a year. The manna ash is grown near the capital, and manna not being monopolised by the government in Sicily, as in Naples, it might be a profitable article of trade if there were any public enterprise. Liquorice is found growing wild in several parts of the island, and considerable quantities of juice are exported. The culture of shumac is more attended to, and it forms a principal article of export.

Potatoes, which have been introduced during the present century, are become a principal article in the diet of the peasantry. The farm-labourers, who are very badly lodged, receive, according to M. Simond, from 3 to 4 *carlini*, or from 1s. to 1s. 4d. a day. Besides potatoes, their food consists mostly of maize polenta, onions, garlic, salt fish, cheese from sheep's milk, oil, and beans, which last are a staple in the food of both men and cattle. The peasantry sometimes eat salted pork, but rarely any other kind of flesh. (*Simond, Galt, Blaquiere, &c., passim*.)

The want of improved means of communication is one of the greatest drawbacks on agriculture; except in the vicinity of Palermo and other great towns, they are all but unknown; and the only mode of travelling is by means of the *stizza*, a kind of fly without wheels, holding two persons, and carried like a sedan chair by two mules, one before and the other behind. Happily, however, government appears to have at length become alive to the evils arising from the want of roads, and 1 per cent. of the land tax is henceforth to be applied to their construction; and permission has also been given to raise a loan of 1,000,000 dollars, at 5 per cent., for the same purpose. (*Rattner's Italy*, ii.)

Formerly there were only certain ports from which corn could be exported; a limitation which gave rise to the establishment at these ports of public magazines, or *caricatori*, where the corn may be deposited till an opportunity occurs of shipping it off. Provided it be of good quality, and be brought in immediately after harvest, or, at farthest, in August, it is warehoused free of expense; what it gains in bulk after that period (about 5 per cent.) being sufficient to defray all expenses. The receipt of the *caricator*, or keeper of the magazine, is negotiable like a bill of exchange, and is the object of speculative purchases on the exchange at Palermo, Messina, &c., according to the expected rise or fall in the price of corn. The depositor of a quantity sells it in such portions as he pleases, the whole being faithfully accounted for. The public magazines, in some parts of the island, are either excavations into calcareous rocks, or holes in the ground shaped like a bottle, walled up, and made water-proof, containing each about 300 salme of corn, or about 2,250 Engl. bushels. The neck of the bottle is hermetically closed with a stone fastened with gypsum. Corn may be thus preserved for an indefinite length of time; at least it has been found in perfectly good order after the lapse of a century. (*Simond*, p. 540; *Swinhurne*, ii. 405.)

The rearing of live stock occupies even less attention than tillage. In general, the horses, mules, and asses of Sicily are small and ill made; the mules of Modica and the asses of the Pantellarian breed being exceptions. The Tunis, or reddish-brown, and long-horned breed of cattle, are large, strong, and well formed, and there is a good breed of goats. But the sheep, excepting a few Merino flocks, are very inferior, and their wool is used only in the coarse manufactures of the country. Hogs are of the worst possible breed. Forests, owing to waste and mismanagement, have almost disappeared, except on the flanks of Etna and on some of the N. mountains. Staves for wine casks, and ship timber, are mostly imported from other countries, and even fire-wood is scarce.

The fisheries are chiefly conducted by corporations of fishermen, or monied individuals. That at Palermo employs, during the season, from 900 to 1,000 boats, and 3,500 fishermen; and the produce is valued at from 20,000*l.* to 25,000*l.* a year. The fishermen of Palermo belong to 2 corporations, each of which has a physician, surgeon, chaplain, and other officers, who are paid from a fund raised by a subscription from each member, of about 3 per cent. on his share of the produce. This fund is also applied to the relief of members, and other general purposes. Tunnies, the fish principally caught on the Sicilian coasts, are taken in in other parts of the kingdom of Naples (which see). This valuable fish, which was in great request in antiquity, as well as in modern times, is of large dimensions, being generally from 4 to 8 ft. in length, with a nearly equal girth. Its flesh is highly nutritious. The shoals of tunny enter the Mediterranean early in the year. The *tonnare*, or fishing establishments, on the Sicilian coasts, are more extensive and valuable than those in any other part of the Mediterranean. The nets belonging to the one in the Bay of Palermo are so very strong as to be able to arrest the progress of a ship when under sail. The fishery of the sword-fish is confined chiefly to the Straits of Messina, and the anchovy and pilchard fisheries to Siculiana. Lentini has some trade in *botarga*, made of the roe of the mullet. The coral fishery, near Bona, in Africa, is principally frequented by fishermen from Trapani, at which city the coral is polished, and brought for exportation to Catania, Naples, Leghorn, &c.

The minerals of Sicily are important and valuable. Sulphur ranks first; it is found in great quantities imbedded in blue marl, or in gypsum and limestone, over

most of the central and S. parts of the island. The sulphur mines have been wrought for upwards of 300 years; but it is only since 1820 that any extraordinary quantity has been prepared for exportation. Subsequently to 1833, the trade with this country increased so much that the export of sulphur to the United Kingdom rose from 19,122 tons in the above year, to 38,654 tons in 1838. In this year, however, the Neapolitan government granted to a French company the monopoly of the trade in sulphur, the production of which was to be limited to 600,000 quintals, to be supplied to the company by the proprietors of the mines at certain fixed prices, on condition of the latter paying to the government a bonus of 400,000 Neapolitan ducats a year! It is needless to dwell on the impolicy and absurdity of such a project. Instead of attempting to limit the export of sulphur, government should have given it every possible facility; and taking the export under a free system, at only 1,000,000 quintals, it would have yielded, at the low duty of 2s. a cwt. on export, a larger sum than was to be paid by the company for their monopoly. Luckily, however, a firm remonstrance by England occasioned the suppression of the monopoly, and the sulphur trade is again restored to its former state. Some sulphur mines are wrought by English speculators with machinery brought from England, and workmen from Wales, Cornwall, and Scotland; but in most of the other mines, the processes are very rude, and, in melting, a great part of the sulphur is allowed to escape in gas, to the destruction of the surrounding vegetation. Sicily furnishes saltpetre of excellent quality, in sufficient quantity for her own consumption, but from want of enterprise, none is produced for exportation. Rock salt, bitumen, gypsum, and marble of different kinds, are found in various places; and good salt is made at Trapani and other coast-towns. There are also ores of copper, lead, mercury, and iron; but very few of these are wrought. There are no iron foundries in the island; and iron and tin goods are principally imported from England, lead from Spain, and steel from Germany.

In some of the principal cities there are a few manufactures of silk, woollen, cotton, and linen stuffs; the cotton, and woollen yarn being imported from Naples, Salerno, &c. A successful attempt has of late been made at Trapani to spin low Nos. of cotton twist by steam power; and some progress is making, both at Palermo and Messina, in the manufacture of ordinary printed muslins, and such like articles. At Palermo there are also oil-cloth and glass factories. But both glass and oil-cloth, with cotton and coarse woollen goods, India handkerchiefs, cravats, and earthenware, are principally supplied by England: fine woollens, printed cottons, and silk goods, porcelain, &c., come from France and Belgium; Germany and Holland send the principal part of the linen goods; paper and Swiss goods are imported from Geneva; and dye woods and colonial products come direct from America. The duties on most articles of import are so very high, that a large proportion of the goods consumed in the island, especially sugar and other colonial products, are smuggled. The following is an

ACCOUNT of the Quantities and Values of the principal Articles, the Growth and Produce of Sicily, exported from that Island in 1839:—

Articles.	Weight, or Measure.	Totals.	
		Quantities.	Value.
Argol and cream of tartar	Cwts.	10,055	12,012

During the same year the value of the imports into Sicily amounted, according to the official returns, to 668,998*l.*; the principal articles being sugar and other colonial products; cotton stuffs, yarn, and wool; woollens,

silks, and knens; hides, hardware, fish, &c. But, as already stated, the official returns afford no real test of the amount of the imports, the value of which may be safely estimated at above 1,000,000*l.* There belonged, in 1838, to the different Sicilian ports about 2,250 vessels, of the aggregate burden of about 43,000 tons, employing about 25,000 men.

Accounts are kept in ducats = 3s. 5*d.* of 10 tarini; the tari = 4*l.*d., equivalent to 10 bajocchi, of 2 grani and 8 piccioli each. The oncia of 30 tarini = 10s. *3d.* The lb. = 7 lb. Eng.; the salma of wheat, &c. = 7*l.* Eng. bushels. The palmo = 10 inches 3 lines Eng.; the braccio = 3 palmi; the canna = 8 palmi.

Government. — The feudal system was introduced into Sicily by Count Roger, soon after the expulsion of the Saracens, in 1072. He also established a representative assembly, or parliament, which subsisted, notwithstanding the many changes the island has undergone, down to our own times. This assembly consisted of 3 estates, or *braccio*. The first, or *braccio ecclesiastico*, comprised 66 prelates, abbots, and other clergymen; the second, or *braccio militare*, comprised 227 nobles, among whom were 58 princes, 27 dukes, and 37 marquises, but the larger portion of the nobility had no seat in the assembly; the third, or *braccio demaniale*, comprised 43 representatives of as many free towns. The Prince of Butera was hereditary president of the assembly. (*Swinnburne*, ii. 170.) It is obvious, from this statement, that the nobles and clergy had an overwhelming majority in this assembly; and while the possession of by far the greater portion of the landed property of the island made the substantial and real equal to the numerical ascendancy of those two classes, the establishment of majors and entails, and the servitude of the peasantry, who were in the most absolute state of dependency on their lords, interested the latter in the support of abuses that opposed insurmountable obstacles to the public prosperity. No wonder, therefore, that the Sicilian parliament should have failed in producing the advantages we are accustomed to ascribe to such institutions; and that it should, in fact, have become a bulwark for the defence and protection of the most oppressive and odious privileges.

The crown was quite as anxious as the burghers to limit the privileges of the *braccio militare*, provided that could be done without extending the privileges of the people in a constitutional point of view. But not daring openly to attack so powerful a body, it fell upon the device, worthy of the bigotted and imbecile government of old Spain, of ruining the industry of the country, by laying restrictions on the exportation of its produce, that it might, in this way, impoverish the barons! (*Brydson*, p. 350. edit. 1806.) This wretched system, if so we may call it, was acted upon during the whole of last century, and Sicily was a prey to every sort of abuse. At length, in 1812, a new constitution was established, under the auspices of Lord William Bentinck, commander of the British forces in the island. Under this constitution, which was formed on the model of that of England, the legislative power was vested in the king, and in an upper house consisting of barons and bishops, and a lower house elected by the people. Unluckily, however, Sicily was not in a condition suitable for the working of such a form of government. The upper house had every thing to lose, the lower every thing to gain; and though some members of the former saw the expediency or rather necessity of yielding up injurious privileges and making timely reforms, the far greater number were firmly opposed to all innovation. Under such circumstances no improvements could be effected; and the constitution becoming unpopular with all parties, the crown had little difficulty in effecting its abolition in 1816, and in establishing a new arbitrary system of government. Since then the administration of Sicily has been assimilated to that of Naples; and, as already seen, several important and, on the whole, highly beneficial changes have been introduced. (*Raumer's Italy*, ii. 288., &c.)

Trials are public, but not by jury. Until very lately, the police service was conducted, as in Sardinia, by a number of companies, having each at their head a captain, who chose his men at pleasure, and who was bound to make compensation for all robberies and thefts committed in the day-time on the high roads within his district. The companies were paid out of the public treasury; but since 1837 they have been abolished, and their place supplied by *gendarmes*. Sicily is not subject to any forced levy of soldiers for the Neapolitan army.

The Rom. Catholic is the established religion, but others are tolerated. There are about 58,000 Greeks in the island, chiefly living in the *Piana dei Greci*, near Palermo, and a few thousand Jews. There are 3 archbishoprics, those of Palermo, Messina, and Monreale; 10 bishoprics, and priests in all the communes. The church is chiefly maintained by revenues derived from landed estates. There were, in 1829, fewer than 658 monasteries; and the monks, whose subsistence forms a heavy tax on the industry of the labouring class, amounted, at

the same time, to 7,591. (*Giornale di Statistica, Palermo*, 1836, No. 1. 111.) Education is almost wholly in the hands of the clergy, but it is better conducted than in the rest of the Neapolitan dom.; and if the quality of the instruction were at all commensurate with the number of schools, the people of Sicily would, in this respect, be fully on a level with most other countries. Palermo and Catania have flourishing universities, both of which have had many distinguished individuals among their professors: there are colleges and academies in 21 towns, and primary and secondary schools in each commune. In these popular schools, besides reading, writing, and arithmetic, the pupils are taught linear drawing and the geography of Sicily. In the prov. of Catania the method of mutual instruction has been adopted. There are several Jesuits' schools, 3 episcopal academies for divinity students, and boarding-schools for the nobility, &c., at Palermo. Females are usually educated in convents till they be 18 or 20 years of age. Some scientific journals are published, especially at Catania, a city distinguished for the superior education and morals of its inhabs. But it would be nugatory to expect that there can be any thing like an efficient system of superior education, or any literature or philosophy deserving the name, in a country where the press is subject to the most severe censorship; and where all foreign works that might tend to expand the minds of the people, and to make them acquainted with their rights and duties, and with the elements of national prosperity, are as rigorously excluded as if they were fraught with pestilence. Sicily has numerous hospitals and public institutions, but they are said to be generally ill-conducted. In most large towns there is a *monte-di-piùta*, or government pawn-bank.

Besides the *fondiaria*, or land-tax of 12½ per cent., the public revenue is derived principally from a tax of 13 taris and 12 grains per salma on the grinding of corn, a duty of 4 gr. per rotolo on the meat consumed in the provincial capitals, with customs duties, and duties on shipping, stamp and registration duties, tobacco duty, the lottery, the post-office, and a duty on the salaries of all persons in official situations. The whole may amount to about 1,500,000 ounce, that is, to about 950,000*l.* a year gross revenue. We subjoin a copy of that part of the Budget for Sicily for 1837, which gives a view of the revenue of the Island, and of the sources whence it is derived. [See top of next column.]

Each intendency is under the control of an intendant or prefect, with a council and secretary, and each district under a sub-intendant, council, and secretary. The head board of police for the island, which sat at Palermo, has been dissolved, and the intendants and subintendants now communicate directly with the ministry. Each community is under a syndic elected by the inhabitants from among their number. In each commune and every quarter of the principal cities, there is a *conciliatore* nominated by the king on the recommendation of the inhabs., who gives summary decisions in disputed matters not exceeding the value of 6 ducats; a judge for each *circondario* resides in every principal town, and each intendency has a civil tribunal with a president, 3 judges, an attorney-general, and a chancellor, and a superior criminal tribunal. The superior courts in the intendancies of Palermo, Catania, and Messina are at once civil and criminal tribunals, and have 6 judges each. That at Palermo has the supreme jurisdiction throughout the island. There are, in fact, no fewer than 250 judges among a pop. of 2 millions! The 150 judges of *circondario* receive from 3*8* *l.* to 8*1* *l.* each, the civil judges about 15*0* *l.*, criminal do. from 210 to 250*l.*, and the judges of the supreme court from about 400*l.* to 600*l.* a year; but this excessive multiplication of courts and judges is a nuisance rather than any thing else. With few exceptions, too, the judges and other legal functionaries are said to be notoriously corrupt. But the principal obstacle in the way of the proper administration of justice consists in the obscurity and contradiction of the laws. This affords great facilities for, and temptations to litigation, and the country is, in consequence, overrun with swarms of low, pettifoggling attorneys. There can, indeed, be no doubt that one of the greatest improvements of which the island is susceptible would be the simplification of the law, and the dismissal of more than half the present judges, giving their salaries to those that were still retained. "The prisons," says Mr. Macgregor, "especially those for political offenders, seem to claim a large share of the attention of government; not, however, for the comfort of the prisoners, but for their security. The state and criminal prison on the island of *Marittimo*, contains, perhaps, the most horrid and strongest dungeons in the world. The prisoners are lowered down several hundred feet from the rocky height above, and are seldom, if ever, heard of afterwards." (*Report*, p. 45.)

**Inhabitants.**—The Sicilians are of middle stature, well-made, with dark eyes, and coarse black hair: their features are better than their complexions; and they at-

tain maturity and begin to decline earlier than the inhab. of more northern regions. They are cheerful, inquisitive, and faithful, with a redundancy of unmeaning compliments; showing they are not so deficient in natural talents, as in their due cultivation. Their delivery is vehement, rapid, full of action, and their gesticulation violent; the latter is so significant as almost to possess the powers of speech; and animates them with a peculiar vivacity, bordering, however, rather on conceit than wit, on farce than humour. The upper classes are incongruously violent, and fond to excess of titles, and such like marks of distinction. Here, in fact, every house is a palace, every handicraft a profession, every respectable

person at least an excellency, and every errand-boy is charged with an embassy! This love of ostentation is so inveterate, that the poorer nobility and gentry are pecuniarily to an extreme in their domestic arrangements, and almost starve themselves to be able to appear abroad in the evening with a mean and poverty-stricken equipage. Notwithstanding the energies of the peasantry be impaired by the mildness of the climate, and the multiplied oppressions of which they are the victims, they may be said, as compared with the upper classes, to be industrious; they are also sober; but passionate, ignorant, credulous, and superstitious. They are, however, bigots, rather than fanatics; and are civil and kind to such heretical strangers as may be thrown in their way. There is a great want of keeping, and of comfort, even in the best houses; and in them, and, indeed, every where, there is a disgusting want of cleanliness. (*Smyth*, pp. 26—66; *Stobberg*, iv. 350, &c.)

Sicily early became the seat of many flourishing Greek colonies, of which Syracuse and Agrigento were the most celebrated. At a subsequent period it was the scene of an obstinate and lengthened contest between the Carthaginians and Romans, and became the first and most valuable acquisition made by the latter beyond the limits of Italy. After the fall of the Western Empire, it was successively held by the Vandals, the Goths, and the Greek emperors, till 827, when it was overrun by the Saracens. In 1072 it was taken by the Normans, who, as already seen, established the feudal system, and kept possession of the island till the establishment of the Swabian dynasty, in 1194. In 1265 Charles of Anjou became master of Sicily; but the massacre planned by John of Procida, known by the name of the "Sicilian Vespers," 29th March, 1282, put an end to the sway of the Angevines. It soon after became a dependency of Spain, and was governed by Spanish viceroys till 1706, when a popular revolution annexed it to Austria. By the peace of Utrecht, in 1713, it was ceded to Victor Amadeus of Savoy, who, in 1720, it was compelled by the emperor Charles VI. to exchange it for Sardinia. In 1734 the Austrians were driven out by the Spaniards, and the infant Don Carlos was then crowned king of the two Sicilies. While the continental dominion of Naples were held by Napoleon, Palermo was the residence of the court, the island being defended by an English fleet and garrison. An insurrection that broke out in 1821 was speedily suppressed by the Austrians. (*Smyth's Sicily*; *Serristori's Statistica*; *Maugreor's Report on Sicily*; *Roumer's Italy*; *Swinhurne, Blaquiere, Hughes, Simoni*, &c., *passim*.)

SIDMOUTH, a sea-port, market-town, and par. of England, co. Devon, 1000. E. Budleigh, on the Sid, at its mouth in the English Channel, 134 m. E. S. E. Exeter. Area of par., 1,570 acres. Pop., 3,136. It is situated between two steep ranges of hills, which enclose it on every side except the S., where it is open to the sea. From its sheltered situation, freedom from fogs, and the beauty of its surrounding scenery, Sidmouth has long been a favourite watering-place, and was frequently visited by George III., his queen, and court. The port was formerly of some consequence; but being choked up by sand, it is now accessible only by small vessels. The sands, however, have contributed to its popularity as a bathing place; and it has a handsome promenade on the beach, warm baths, good assembly, reading, and billiard rooms, and the other establishments usual at such places for the accommodation of visitors. Attached to the town are the suburbs of Western Town and the Marsh. The parish church, an ancient building, belonged, in the 13th century, to St. Michael's monastery in Normandy; it contains a monument to the celebrated Dr. Currie of Liverpool, the first and best biographer of Burns. The living, a vicarage, in the patronage of the present incumbent, is worth £471. a year. There are Baptist, Independent, and Unitarian chapels, a national school, several charities for the relief of the poor, a theatre, &c. Petty sessions for this and the neighbouring par. are held monthly at Sidmouth; and courts-leet and baron, at which the peace-officers, &c., are chosen, are held annually. Sidmouth gives the title of viscount to the Addington family. Markets on Saturdays. Fairs, Easter Monday and Tuesday, and third Monday in Sept., for cattle. (*Parl. Reports*, &c.)

SIENA, or SIENNA, (an. *Senia Julia*), a city of central Italy, Grand Duchy of Tuscany, cap. prov. of its own name, on three small hills, between two tributaries of the Ombrone, 30 m. S. by E. Florence. Pop., in 1836, 18,975. The neighbouring country is rugged and naked; but the city itself is embosomed in trees, and entered by a fine avenue, which gives it an agreeable and imposing appearance from without. Its streets, however, are narrow, steep, and uneven; and its houses, though often dignified with the title of palaces, are built of brick, and are nowise remarkable for their architecture. The inhabitants are active, intelligent, and industrious.

"Though fallen from its former rank, as a republican

city with 150,000 inhabs. (?), to that of a provincial town, with the melancholy title of the capital of the Maremma, Sienna "exhibits no signs of decay, but has, on the contrary, every appearance of active industry, with scarcely any beggars; the streets are well paved and very clean; the shops numerous and well supplied; the people well-dressed, and the women remarkably graceful and good-looking." (*Siemond, Tour*, &c., 571.) The principal public building is the cathedral, a vast, and, on the whole, magnificent Gothic edifice, founded in the 13th century, though not wholly of one date, and built in alternate courses of black and white marble. It has been severely, and, we believe, justly, censured by Forsyth for its incongruousness, want of taste, and barbarous emblematic devices. Over the arches supporting the nave is a series of the heads of popes; and the pavement is a kind of mosaic-work, much of which is very beautiful. The sacristy is adorned with a history of Pope Pius II., partly painted by Raphael at a very early age, and partly from his designs; and in the same room is a most beautiful antique group of the three graces. (*ibid.*, 315.) Under this building is an ancient Etruscan church, which, if the cathedral, as is affirmed, stand on the site of a temple of Minerva, is most probably, of remote antiquity. The churches of St. Dominico and St. Catherine, the hospital, city hall, and theatre, are worth notice. The city hall is in the great piazza, a sloping semicircular space, laid out in walks, ornamented with statues, and forming the principal lounge of the inhabs. The citadel, facing the main street, has an esplanade and ramparts, planted with trees, which also form favourite public walks. The antiquities include a Roman gate, the remains of ancient walls, &c., and it has a fountain celebrated in Dante's *Inferno*, and several good public and private galleries of paintings.

Sienna has some reputation as a seat of learning. Its university, founded in 1330, has a library of 25,000 vols., and had formerly 60 professors. Its importance has greatly declined; but it is still celebrated as a school of medicine, and may have about 300 pupils. It has, also, an ecclesiastical and several other seminaries (including some for *pugilistic science* (for which Sienna was renowned in the 13th century), and various academies and learned societies, among which last are the *Rosce*, and *Introvati*, considered the oldest establishments of their kind in Europe. The Siennese pique themselves on speaking the Tuscan language in its greatest purity.

Sienna, which is an archbishop's see, has about 10 woollen factories, besides manufactures of hats, paper, leather, &c. Its chief trade is, however, in corn and other agricultural produce, and the marble of its vicinity. Augustine sent thither a Roman colony, previously to which this city appears to have been insignificant, though boasting of very high antiquity. In the middle ages it was, like Pisa, Florence, &c., the cap. of a republic, constantly at war with its neighbours; and it was generally flourishing and independent, till Philip II. of Spain took and conferred it, with its territory, on Cosmo I. of Florence. The French took it in 1808; and, previously to 1811, it was the cap. of the dep. of Ombrone. No fewer than 7 popes, including Pius II., Gregory VII., and Alexander III., with Scorsius, and other eminent individuals, have been natives of Sienna. (*Siemond*; *Forsyth*; *Bouring's Rep.*; *Corder's Italy*, iii. 60—80, &c.)

SIERRA-LEONE, a colonial establishment of Great Britain, on the W. coast of Africa, consisting of a peninsula, about 25 m. in length, N. and S., washed by the Atlantic on the N.W. and S., and partially bounded on the E. by a bay formed by the Sierra Leone river. Free Town, the cap., on the N. shore of the peninsula, is in lat. 8° 29' 49" N.; long. 13° 15' W. It had, in 1839, a pop. of nearly 42,000, all black or coloured, except about 100 Europeans. The peninsula consists principally of a range of conical mountains, from 2,000 to 3,000 ft. in height, surrounded by a belt of level ground, from 1 to 5 m. in breadth. This is probably the most unhealthy situation in which Europeans have ever attempted to establish a settlement. The principal characteristic of the climate is its extreme humidity. The enormous quantity of 314 inches of rain appears to have fallen at Sierra-Leone during three months of 1838, and more fell in two successive days, the 23d and 24d of August, than in Britain throughout the entire year! There are two seasons, the wet and the dry. At Sierra-Leone and the Isles de Loss, the former extends from May to Nov., and at the Gambia from June to Sept. or Oct., and is always ushered in and carried off by tornadoes. Nothing can exceed the gloominess of the weather during this period; the hills are wrapped in impenetrable fogs, and the rain falls in such torrents as to preclude all exercise and amusement out of doors. At this period fevers of nearly every type, dysenteries, liver complaints, and other diseases, usually make their appearance; though they are so prevalent at all times that they can scarcely be said to belong exclusively to any season. During the 18 years,

from 1819 to 1836, every white soldier in the colony was, at an average, three times a year under hospital treatment, and nearly half the force perished annually; and in 1825 and 1826, when the mortality was at its height, three fourths of the troops were cut off. To accept a situation in Sierra-Leone has, in fact, been little else than a species of suicide. Nor is the destructive influence of the climate confined to the whites only; the blacks, though in a less degree, are affected by it, and often die in great numbers. (See Tulloch, *Report on the Health of the Troops, &c.*)

*Objects of the Colony, &c.*—This colony was founded in 1787, partly as a commercial establishment, but more from mistaken and ill-considered notions of humanity. Being intended to consist principally of free blacks, who were to be instructed in the Christian religion, and in the arts of Europe, it was supposed it would become, as it were, a focus whence civilisation might be diffused among the surrounding tribes. About 1,200 free negroes who, having joined the royal standard in the American war, were obliged, at the termination of that contest, to take refuge in Nova Scotia, were conveyed thither in 1792. To these were afterwards added the Maroons from Jamaica; and, since the legal abolition of the slave trade, the negroes taken in the captured vessels, and liberated by the mixed commission courts, have been carried to the colony. But the efforts made to introduce order and industrious habits, and to lay the foundations of civilisation amongst the blacks, though prosecuted at an enormous expense of blood and treasure, have, we regret to add, been signally unsuccessful. And this, after all, is the only result that could have been rationally anticipated. The laziness of the blacks has been loudly complained of, but without reason. Men are not industrious without a motive; and most of those motives that stimulate all classes in colder climates to engage in laborious employments, are unknown to the indolent inhabitants of this burning region, where clothing is of little importance, and all but dispensed with, where sufficient supplies of food may be obtained with comparatively little exertion, and where more than half the necessities and conveniences of Europeans would be positive incumbrances. And had it been otherwise, what progress could a colony be expected to make, into which there are annually imported thousands of liberated negroes, who, if not wholly incapable of civilisation, are, at all events, in the lowest stage of barbarism? The hopelessness of making any beneficial change in the character and condition of the blacks, by keeping up this most pestiferous establishment, is now so very apparent, that it may be hoped it will be speedily abandoned. Latterly, indeed, some of the liberated Africans have been carried to the W. Indies, where they may be of some use, which is not the case here.

Commercially considered, Sierra-Leone appears to quite as little advantage as in other points of view. The country round the settlement consists of a vast and all but impenetrable forest, only small patches of which have been cleared and cultivated. The principal articles of export consist of teak and cam wood, with ivory, palm oil, hides, gums, and a few other articles; but their value is inconsiderable, amounting to not more than from 60,000*l.* to 100,000*l.* a year. The great article of export from the coast of Africa is palm oil, and of this more than 50 times as much is exported from the coast to the S. of the Rio Volta, several hundred miles from Sierra Leone, as from the latter. We doubt, indeed, whether the commerce with the western coast of Africa will ever be of much importance. The condition of the natives would require to be very much changed, of which there is not the slightest prospect, before they can become considerable consumers of European manufactures. It is singular, that speculative persons in this country should be bent on prosecuting, without regard to expense, a trade with barbarous uncivilised hordes, while they contribute to the neglect or suppression of the incomparably more extensive and beneficial intercourse we might carry on with the opulent and civilised nations in our immediate vicinity. We are bold to say that the equalisation of the duties on Canadian and Baltic timber, and the abolition of the existing restraints on the trade with France, would do ten times more to extend our commerce than the discovery of 50 navigable rivers, and the possession of as many forts or factories on the African coast.

The government of Sierra-Leone is vested in a lieutenant governor, assisted by a legislative council of 5 official mems. The chief justice presides in the supreme court of law, held alternately in the course of the year at the different stations under his command; and there are mixed commission courts for the adjudication of vessels taken in the slave-trade. The colony is subdivided into 6 districts and about 16 parishes, in each of which are one or more schools on the Lancasterian or the national system. Total military force (1841) 306 men, besides militia, &c. Total public revenue of Sierra-Leone and Gambia in 1839, 20,000*l.*; expenditure, 108,056*l.* In fact, this wretched dependency has cost the British public several

millions, independently of the enormous sacrifice of life. St. George, or Free Town, the cap., is on the S. side of the estuary of the Sierra-Leone river, being surrounded on all other sides by an amphitheatre of mountains about 1 m. distant. The town and par. had a pop., in 1838, of 13,523. Its houses are mostly of wood, and disposed in broad and regular streets; around it are the country-houses of the white residents. The drainage of the town has of late been materially improved, but without much perceptible effect on its salubrity.

The villages dispersed in different parts of the colony consist of huts, built of wood and thatched with straw, so tight that they are easily moved from place to place. The woods and mountains are infested with a great variety of wild animals, and the rivers swarm with alligators. Insects are so numerous and offensive as to be really a plague.

The settlements on the Gambia consist of St. Mary's Island, at the mouth of the river; area, 5 sq. m.; and McCarthy's Island, about 330 m. up the river. Aggregate pop., in 1839, 4,495, of whom only 49 were whites. The trade of this settlement, though inconsiderable, is of more importance than that of Sierra-Leone, the value of the exports, in 1839-40, having amounted to 124,669*l.*

The Cape Coast Castle (see p. 687), which sec. the trade of the stations of Cape Coast, Accra, &c., along the A. coast. The climate is nearly as insalubrious as that of Sierra-Leone; but since 1828, British troops have not been sent to die in these settlements, the defence of which has been entrusted to a native force of about 200 men. The trade of this part of the coast is of considerably more importance than that of Sierra Leone, the value of the exports, chiefly palm-oil, dye woods, Guinea grains, gold-dust, and ivory, having amounted, in 1839, to 324,067*l.* An active trade in palm oil appears to have been growing up of late at the river Bonny. (Tulloch's Reports; *Report on the Colonies of H. Africa*, 1841, &c.)

SIGMAREN (Sigmaringen, S. 49° 11' N. 9° 11' E.), one of the minor independent principalities of Germany, which, with Hohenzollern-Hechingen, lies mostly between lat. 48° and 49° N., and long. 9° 25' and 10° 25' E., enclosed by Wirtemberg on all sides except the S., where it touches the territory of Baden. H.-Sigmaringen is separated into two portions by H.-Hechingen; its S. portion is watered by the Danube, and the N. by the Neckar, &c. It has an area of 387 sq. m., with a pop., in 1838, of 41,940, nearly all Rom. Catholics. Except in the S. the soil is generally poor; still, however, rather more corn is grown than is required for home consumption. Potatoes, flax, and fruits, are also grown; but the chief wealth of the state consists of its timber, cattle, and hogs. The rural population is partly occupied in manufacturing cotton and linen cloths, and hardware. Since 1829 it has had a constitutional government; but Berchthaus does not say how the representative assembly is constituted. Appeal from the high court at Sigmaringen lies to the superior court at Stuttgart. The revenues of the prince amount to about 300,000 florins a year, partly derived from his estates in Holland. The contingent to the army of the Germ. Confed. consists of 336 men. The cap., Sigmaringen, on the Danube, has a pop. of 1,400. There is no larger town.

Hohenzollern-Hechingen has an area of 138 sq. m., with, in 1838, a pop. of 19,200. It is mostly mountainous, and cattle breeding forms the chief occupation of the inhabitants. It has a constitutional assembly formed of 2 representatives for the town of Hechingen, and 10 for the rural districts. Appeal from its superior law court presided over by the prince, may be made to the high court at Stuttgart. Total public revenue, 120,000*l.* Contingent to the army of the Germ. Confed. 145 men. Hechingen, the cap., on the Starzel, has 3,000 inhabs., several fine buildings, and some woollen manufactures. A little to the S. is the castle of Hohenzollern. Each of these principalities has a vote in the full diet of the Germ. Confed.; and, with Bressau, Lippe, Waldeck, and Liechtenstein, they have the 16th place and 16 vote in the Committee.

SILESIA, an important and valuable prov. of the Prussian dominions, lying N. the prov. of Posen, E. Poland and Cracow, S. Austrian Silesia, Moravia, and Bohemia, and W. Saxony and Brandenburg. It lies between 49° 46' and 52° N. lat., and 14° 25' and 18° 12' E. long., and has an oblong shape, extending N.W. and S.E. about 24 m. Area, 15,711 sq. m. Pop., in 1837, 2,645,166; of whom 1,394,083 are Protestants, 1,225,555 Catholics, and 25,510 Jews. The proportion of Protestants to Catholics has increased considerably since the Prussian conquest. Principal towns, Breslau, Liegnitz, Glogau, Gorlitz, Neisse, Glatz, Oppeln, &c. It is divided into three regencies, and these again into 57 circles. Surface rugged and mountainous along its S. and S.W. frontier, but in other parts it is either flat or but slightly undulating; this is particularly the case on the E. side of the Oder. The river now mentioned traverses the whole of the Silesia; and, being navigable for barges almost

to the extreme S. limits of the province, it forms a valuable channel of communication. The other great rivers, the affluents of the Oder, are the two Neisses and the Hober on the S., and the Malapané and Bartsch on the N. Soil very various, being in many parts loamy and highly productive, and in parts marshy and sandy. Great part of the regency of Oppeln is covered by vast forests. Principal products, corn, flax, and hemp, produced in very large quantities: the stock of sheep amounts to about 2,800,000 head; wool, of a very superior quality, now forms, next to linen, the principal article of export from the province; among the other products are beet-root sugar, timber, madder, tobacco, silk in small quantities, &c. Silesia is rich in mineral products. Coal is found in many parts, particularly in the vicinity of Schweidnitz, and Neisse, Glatz, &c. There are also valuable mines of iron, lead, zinc, copper, &c.

Manufactures are important and valuable. Linen is the principal product for some years past it has been declining, the cotton manufacture having grown up in the interval to a considerable state of advancement. The woollens manufactured are generally coarse, but they employ a considerable number of hands. No accounts have been published, on which any reliance can be placed, of the products and values of the different manufactures established in Silesia. The condition of the inhabs. of this prov. has been vastly improved, both as respects their command over the necessities and conveniences of life, and their intelligence, since they became subjects of Prussia.

An intelligent observer, speaking of Silesia, observes, "In a country where linen is a staple commodity, the majority of the men are weavers, which trade they often exercise in conjunction with their employment as agriculturists; and the women, without exception, are spinners of flax, for we frequently see the better classes pursuing their thread-making occupation, not only in the saloon, but in the promenade, and the lower orders in their huts and on the high road, even while their heads are heavily laden with provisions for the market; but instead of the wheel they use the distaff, which, I was informed, was the prime cause of the superior excellence of the Silesian linen, as the thread is by this process rendered more soft, round, and less inclined to break. There is, however, a wide difference between the inhabs. of Silesia descended from German colonists and the native Slavonians, particularly those who people the districts on the frontiers of Poland. The former are industrious, cleanly, and manufacturing; while the latter are debased by ignorance, mendacity, and superstition; they also resemble their neighbours the Poles, not only in their language, which is a species of Polish patois, but in their sheep-skin jackets and greasy kappas, neither of which are ever allowed to contaminate soap and water; another point of similarity is their inordinate attachment to bakka, and a deep veneration for Madonnas, saints, and crucifixes. But, perhaps, no distinctive trait of manners more characterises both than their humiliating mode of acknowledging a kindness, their expression of gratitude being the servile 'Upadam do nog' (I fall at your feet); which is no figure of speech, for they will literally throw themselves down and kiss your feet for the trifling donation of a few halfpence. How abject is the state to which feudal vassalage and superstition have reduced this people!" (*Germany and the Germans*, vol. 1.)

**SILISTRIA** (Turk. *Dristra*), a city of European Turkey, prov. Bulgaria, cap. sanjak, on the Danube, 63 m. E.N.E. Rustchuk. Pop. estimated at 20,000. (*Stein*, &c.) Silistria is a strong military post, and resisted the attempts of the Russians in 1829, though they took it after a nine months' siege in 1829. When visited by Mr. Elliott, in 1837, it was in their hands, having been one of the pledges given by the Turks for the payment of the sums due to Russia. New ramparts lined the whole bank of the river, and an extensive island opposite the town was covered with provender for cavalry horses; while 8,000 regular troops garrisoned the fort. Under a strong lunette were posted a sufficient number of pontoons to form a *pont volant*, requiring only three hours to be united so as to form a complete military communication between the two banks. (*Travels in Turkey*, &c., i. 145, 146.) Since then Silistria has been restored to the Turks. The town is ill laid out, and many of the houses are in ruins. The citadel, several mosques and public baths, and a large bonding-warehouse and custom-house, are the chief buildings. The inhabitants exchange timber and cattle with the Wallachians for salt and hemp; but their trade is not of much consequence. Near the city are the remains of some fortifications thrown up during the Byzantine Empire.

**SIMBIRSK**, a government of European Russia, on both sides the Wolga, having N. the government of Kasan, E. Orenbourg, S. Saratoff, and W. Penza and Nijegorod. Area, 24,200 sq. m. Pop. in 1838, 1,200,000. It consists of a gently undulating plain, having a black, and generally very fertile soil. Besides the Wolga,

## SINAI (MOUNT).

it is watered by the Sura and other affluents of the former. Climate in extremes, the summer being hot, and the winter cold. The Wolga is annually frozen over for about five months. Rye, wheat, and other grain, are raised in quantities more than sufficient for the consumption. Hemp is largely cultivated, with flax, tobacco, poppies, &c. Except among the Kuhnorks, the rearing of cattle is not much attended to. In the N. forests are abundant. Distilleries numerous; and besides the coarse goods manufactured by the peasants, there are establishments for the manufacture of cloth, coarse linen and canvass, and coverlets, with glass-works, soap-works, candle-works, &c. (*Schultzke, La Russie*, &c., p. 676, &c.)

**SIMBIRSK**, the capital of the above government, on the Wolga, on an isthmus between it and the Sviga, lat. 54° 18' 49" N., long. 48° 22' 15" E. Pop. about 13,000. It stands partly on an eminence, which commands a fine view, and partly on a plain. Streets broad and straight; houses mostly of wood, but neat and commodious inside. There are numerous churches, which, with one exception, are all of stone, and two convents. The town is in a fertile country; and besides large quantities of corn, exports the produce of the fisheries on the Wolga. It is a good deal resorted to by the surrounding nobility.

**SIMPHEROPOL**, or **AKMITCHET**, a town of European Russia, in the Crimea, of which it is the capital, 40 m. N.E. Sevastopol. Pop. 4,200. It stands in a fine but not very healthy situation on the river Sulghir, and consists of two parts, one new built by the Russians, in the European style, the other, old and occupied by the Tartars. The streets in the former are wide and regular; and it contains the government offices, and a cathedral, said by Dr. Lyall to be by far the handsomest ecclesiastical edifice he had seen in Russia. (1.112.) Within the last few years some improvements have been made in the Tartar part of the town, but the streets continue to be narrow, crooked, and filthy, and it has a mean, miserable appearance.

The celebrated traveller and naturalist Pallas lived for 15 years in this town. It was his own wish to emigrate thither, and to enable him to gratify it, the Empress Catherine II. made him a present of an estate in the best part of the peninsula. But being cut off from the society he had enjoyed in Petersburg, and exposed to family annoyances, Pallas became dissatisfied with the country and with the climate he had so highly panegyricised. Having sold his estate, he left Simpheropol in disgust in 1811, and returned, after an absence of 42 years, to his native city Berlin, where he died in the course of the same year. (*Biographic Universelle*, art. *Pallas*.)

**SIMPLON**, a celebrated pass over the Alps, where a magnificent road was constructed by order of Napoleon, establishing an easy carriage communication between Geneva and Berne, in Switzerland, and Milan. (*Sic. Art. Alps*, Vol. I. 67.)

**SINAI (MOUNT)**, a mountain of Arabia, near the Gulf of Suez, or upper part of the Red Sea, famous for its connection with some of the most memorable events of sacred history. It is generally supposed to be identical with the mountain called by the Arabs *Djebel Musa*, or Mountain of Moses, or simply *El Tor*, the Mountain. In the peninsula between the Gulphs of Suez and Akaba, in about lat. 28° 25' N., long. 31° 10' E. The group of mountains to which Sinai belongs, and which also includes Mount Horeb, Mount St. Catherine, and other remarkable summits, is surrounded on all sides by deserts occupied only by tribes of Bedouins, or wandering Arabs. The mountains are penetrated by deep chasms, edged by bare perpendicular ledges of rock; and the whole has a singularly wild and sterile appearance.

The convent of St. Catherine, founded by the Emperor Justinian, in a valley on the slope of the mountain, is the halting place whence pilgrims set out to ascend to the summit. Being exposed to the attacks of the Arabs, it looks more like a fortress than a convent. It is an irregular quadrangular edifice, surrounded by high and solid walls, and covers a considerable extent of ground. To prevent being surprised by their troublesome neighbours, the entrance gate, which is rarely opened, is built up; and on ordinary occasions all access to the convent is by an entrance about 30 ft. from the ground, to which travellers, provisions, &c., are raised in a basket made fast to a rope, pulled up by a windlass. The interior of the convent presents little remarkable, all the apartments and chapels being built of rough stone, without symmetry or order, communicating by crooked and dark passages. The Church of the Transfiguration alone possesses any pretensions to magnificence. It is 80 ft. in length, and 53 in breadth, paved with marble, adorned with a variety of figures. The event to which it relates is represented in mosaic. But the grand treasure of this church, and that which is supposed, by zealous Catholics, to confer on it peculiar sanctity and importance, is

\* Dr. Clarke, who seems to have regarded every opportunity of translating the government of Russia as a God-send, ascribes these annoyances to its agency! But Lyall has pointed out their true origin. (*Lyall*, in loc. cit.)

the possession of the relics of St. Catherine, borne by angels to the neighbouring mount, which still bears her name, and subsequently collected and deposited in a marble sarcophagus in this building! The skeleton of the hand, covered with rings and jewels, is the only portion of the remains of the saint that is exhibited to her faithful votaries.

Mount Sinai, as every one knows, is almost as famous in the sacred history of the Mohammedans as of the Jews; and it is a curious fact, that there is a Mohammedan mosque within the precincts of this convent. It has also an excellent garden at a little distance, which is reached by a subterranean passage, secured by iron gates. It produces fruits, plants, and vegetables, in the utmost profusion. The climate is temperate, in consequence of the elevation; and snow even falls in winter.

The ascent to the mountain, which lies through a ravine to the S.W., commences close to the convent. It is steep, but the labour of ascending has been greatly facilitated by rude steps cut in the rock. At the height of about 500 ft. from the convent is a spring of fresh and cold water, covered by a rock, which protects it from the sun and rain. After ascending a little higher, the traveller gains the summit of Mount Horeb, which forms, to use the expression of Laborde, a kind of breast, from which Sinai rises. "Continuing our route from this halting-place by a path, still more rugged and steep than before, we arrived in about 15 minutes at the summit of Sinai, the apex of a peak not more than 50 yards across at its widest part." (*Wellsted*, ii. 95.)

The height of Mount Sinai has been variously estimated, but according to observations taken by Mr. Wellsted, it may be estimated at about 7,500 ft. above the level of the sea, and about 2,500 ft. above the convent of St. Catherine.

On the summit of the mountain is a dilapidated church, which tradition represents as founded on the spot where Moses smelted and lightning, and the smoke of the agitated mountain, Moses received the Decalogue from the hands of the Almighty. (*Exodus*, cap. xx.) Truth, however, is seldom unaccompanied with error; and but a few yards distant from the church are the ruins of a mosque; this mountain, by a singular coincidence, being hollowed alike in the estimation of Jews, Christians, and Mohammedans.

"It seems," says Sir Frederick Henniker, "to a person on the summit of Sinai, as if the whole of Arabia Petraea had once been an ocean of lava, and that, while its waves were literally running mountains high, it had suddenly been commanded to stand still." Mount Sinai itself, Mount St. Catherine, which is still higher, and the adjacent mountains, rise in sharp, conical, granite peaks; and from their steep and shatter'd sides huge masses have been thrown down. The prospect from the summit of Sinai is most extensive; the Gulf of Akaba, on the one hand, and that of Suez on the other, with Mount Agrib, on the Egyptian coast, are distinctly visible. Barrenness and desolation are, however, its grand characteristics. "No villages and castles, as in Europe, here animate the picture; no forests, lakes, or falls of water, break the silence and monotony of the scene. All has the appearance of a vast and desolate wilderness, either grey, darkly brown, or wholly black" (*Wellsted*, ii. 98.) But it is the associations connected with the mountain, and the astonishing events of which it is believed to have been the theatre, that inspire those feelings of awe and veneration felt by all who have either beheld or ascended Mount Sinai.

Considerable doubts have, however, been entertained whether the mountain now described be really the Mount Sinai of the Pentateuch. It might be expected that the summit of the mountain should exhibit some traces of the stupendous phenomena that are said to have accompanied the manifestation of the Divine presence. But, according to Burckhardt, neither Sinai, nor any of the adjoining summits, exhibits any traces of volcanic action. It is supposed by some that the *Djebel Katerin*, or Mount St. Catherine, has the best title to be regarded as the true Sinai.

There are really, however, no means by which to arrive at any satisfactory conclusions on the subject. All that can with confidence be stated (for monkish legends and traditions go for nothing), is that Mount Sinai must be somewhere in this vicinity; and that though the hypothesis, that the *Djebel Musa* and the Sinai of the Bible be identical, be not free from difficulties, it is as much so, perhaps, as any other that has been advanced in its stead. (*Cabinet, Dictionnaire de la Bible*, art. *Sinai*; *Shaw's Travels*, p. 316, 4to ed.; *Laborde's Arabia Petraea*, p. 242.; *Wellsted's Arabia*, ii. 90., &c.; *Burckhardt's Arabia*, &c.)

SINDE, an extensive country of N.W. India, between Hindostan and Beloochistan, comprising the lower course and delta of the Indus; extending between lat. 23° and 29° N., and long. 67° and 71° E.; having N. the Punjab and Bahawalpore territories, E. Rajpootana, S. the Rann of Cutch and the Indian Ocean, and W. Beloochistan

and Cutch-Gudava. Its length, N. to S., is about 350 m.; its breadth is very variable; but its entire area may be about 100,000 sq. m.; and Burnes estimates the pop. at about 1,000,000. Mr. Elphinstone dwells on the striking resemblance between this country and Egypt. "One description might serve for both. A smooth and fertile plain is bounded on one side by mountains, and on the other by a desert. It is divided by a large river, which forms a delta as it approaches the sea, and annually inundates and enriches the country near its banks. The climate of both is hot and dry, and rain is of rare occurrence in either country." But here the similarity ends. Egypt has populous towns, numerous canals, and abundant harvests; while in Sind, such is the barbarism of the country and government, that miserable villages are even few, and agriculture languishes equally with commerce: the policy of the amirs being to keep the land in a state of nature, that their territories may not attract the cupidity of the surrounding tribes. (*Burnes*, i. 241.) The various products of Sind differ little from those of the rest of India. Rice, indigo, tobacco, and sugar-cane are among the principal; besides figs, pomegranates, and even apples are successfully raised at Tatta; and barley, and the common Indian grains, are grown to great perfection in Lower Sind. There are vast herds of horned cattle and sheep, which are generally larger than those of Hindostan. Camels and buffaloes are numerous. Game is very plentiful, though wood is scarce. Salt and saltpetre effloresce almost every where on the soil; and in the hands of an intelligent government, Sind might become a rich country.

The main exports are salt, rice, ghee, hides, saltpetre, cotton, oil, shak's fins, bark for tanning, &c.; with assafoetida, and other gums; Cashmere shawls, saffron, horses, leather, musk, alum, and various drugs and gems from the countries on the N. and W. The principal imports from India are metals, ivory, tea, tin-ware, and other China wares, chintzes, broad cloths, mus, and other Indian and European manufactures; but particularly opium, in transit from Malabar to Bombay. From Persia, and Arabia the Sindians also obtain silks, swords, carpets, dates, rose-water, coffee, &c. (*Pottinger*, &c.) But nearly all the trade centres in Kurachee on the Belooch border; there is little commerce any where else, even on the Indus. Merchants, in prosecuting their journey to Candahar from the sea, or the Indian desert, quit the disturbed and unsafe Sindian territories with all despatch. The only encouragement the chiefs give to any trade is to that in opium, and on that they levy the enormous duty of 250 rupees the camel load. The revenue from this article was estimated not long since to amount to 7 lacs rupees a year.

The government of Sind is a military despotism. The country is divided among a number of petty chiefdoms, called *amirs*, whose aggregate revenue has been estimated at 30 lacs of rupees (300,000 l.) a year. The chief towns are Tatta, Hyderabad, Kurachee, Khyrpoor, Shikarpore, Larkhann, &c. The Sindians are of a middle size, slim, and darker than most of the Inhabitants of Hindostan. Most of them are Mohammedans of the Shiah sect.

There is little to praise in their character: they have nearly all the worst vices of an enslaved people. They are, however, brave in the field, and, unlike other Asiatics, pride themselves on being foot soldiers, preferring, also, the sword to the matchlock; but from want of discipline, their army is a mere rabble, and could oppose no effectual resistance to regular troops. (*Burnes's India*, &c. i. 206—259.; *Pottinger's Beloochistan*; *Geog. Journ.*, vii., &c.)

SINGAPORE, a settlement belonging to Great Britain, in S.E. Asia, consisting of a small island at the S. extremity of the Malay peninsula, i.e. the town of the same name; the latter being in lat. 1° 17' N., long. 103° 51' E. The island is of an elliptical form; greatest length, E. and W., about 27 m.; average breadth, 11 m. Area, estimated at 275 sq. m. Pop., in 1836, 29,984; of whom 13,749 were Chinese settlers, and 9,632 Malays. The island is separated from the main land by a strait, which, though scarcely  $\frac{1}{2}$  m. in breadth in its narrowest part, was the route usually followed by ships between India and China in the early stages of European navigation. But the grand commercial highway between the E. and W. portions of maritime Asia now passes along the S. side of Singapore, between it and a chain of desert islands about 9 m. distant; the safest and most convenient track being so near to Singapore that ships, in passing and repassing, approach close to the roads. The town is wholly indebted for its rapid rise and growing importance to its position on this strait. This has rendered it not merely a convenient *entrepôt* for the trade between the western world and India, on the one hand, and China on the other; but also for that between the former and the Eastern Archipelago, the Philippines, &c.

The surface of the island is low and undulating in some parts, rising into rounded hills, covered with jungle, the highest none of these is 400 ft. in height. It consists prin-

cipally of laterite resting on sandstone; its N. and E. portions are, however, of granite. It abounds with iron ore; but this is the only metallic product hitherto discovered; though, from the great abundance of tin in the neighbouring countries, it probably exists here also. The climate is hot, with but little variation of temperature: the thermometer usually ranges from 71° to 89° Fah.; in 1835 the range lay wholly between 77° and 87°. (*Malcom.*) The total annual fall of rain is about 100 inches: the mousoons are little felt; but the island is kept in a perpetual state of verdure by frequent showers. According to Mr. Crawford, the summits of the hills are generally sterile; but on their slopes and in the intervening valleys there is occasionally a good deal of fertile soil. Gambier or catechu, and fine tropical fruits and vegetables, are grown in tolerable quantities. Nutmegs, coffee, and pepper have succeeded, and the produce of the Chinese pepper gardens for 1836 was estimated at 10,000 piculs. Cloves have wholly failed; and the settlement depends for rice on Java, Bengal, and Sumatra, and for pigs, poultry, and cattle, on Malacca. Down to 1837, when they were in part remodelled, the regulations as to land were great obstructions to the clearing, cultivation, and prosperity of the island.

The absence of the elephant and tiger, and other formidable wild animals, and of the swarms of insects common in warm climates, are circumstances favourable alike to agriculture and the comfort of the inhabs. The only quadrupeds are some small species of deer, the otter, porcupine, and a few others; but it has a great variety of birds and reptiles. Tripping, and *agar-agar*, a delicate fern-like sea-weed, are furnished in great abundance by the neighbouring coral reefs and shoals.

A few manufactures, including that of pearl sago, agricultural implements, arms, &c. are carried on principally by the Chinese. But, as already stated, the entire importance of Singapore consists in its being an emporium—an *entrepôt*, as it were, for the commerce of the adjacent countries, and of that between Eastern and Western Asia, &c. We subjoin an

ACCOUNT of the Quantity and Value of the principal Articles of Asiatic Produce shipped at Singapore during the Year ended April 30, 1836.

In the same year 539 ships, of the aggregate burden of 166,053 tons, entered the port.

The chief imports are cotton and woollen goods, iron, and spelter from Great Britain; opium, Indian piece-goods, and canvass bags, from Calcutta, &c.; ebony and cloves for the China market, from the Mauritius; Banca tin, coffee, and spices, from the Dutch settlements; raw silk, cassia, tea, camphor, and nankeens, from China; for Europe; mother-of-pearl, sugar, rice, oil, bullion, and some Chinese goods, from the Philippines; nearly the same articles from Siam and Cochin China; and rice, oil, sapau wood, tortoise-shell, birds and feathers, camels, &c., from the various islands of the E. Archipelago. The British piece-goods and woollens go mostly to Manila, China, Rhio, Siam, Borneo, and Celebes; cotton twist to the same countries; arms to Borneo and Rhio; glass and iron wares to Manila, China, Sumatra, Java, &c. We subjoin a

COMPARATIVE STATEMENT of the Value of the Exports to the under-mentioned Countries during the Years 1837-38 and 1838-39. [See top of next column.]

The port regulations are upon as liberal and convenient a footing as possible. The attempts hitherto made to impose duties on imports and exports have been successfully resisted; and there are no anchorage, harbour, lighthouse dues, or fees of any description. A register is, however, kept of all exports and imports; and to enable this to be done, reports must be made to the master-attendant by the masters of vessels, and invoices delivered to the superintendent of imports and exports. The principal merchants and agents are Englishmen; but some, also, are Chinese, who compose the bulk of the shopkeepers, with by far the most valuable part of the labouring pop. The European merchants transact business on their own account; but the principal part of their employment consists in acting as agents for houses

in London, Liverpool, Amsterdam, Batavia, Canton, and the capitals of British India. The language of commercial intercourse is generally Malay. Merchants' accounts are kept in Spanish dollars, divided into 100 rials. The principal weights in use are the picul = 133 lbs.; the coyan of 40 piculs; the bunkal (for gold dust) = 832 gr. troy; the bag of rice = 2 lb. m. m. m. &c.

Singapore, which is said to have been the earliest place settled by the Malays emigrating from Sumatra, and an ancient seat of considerable trade, was purchased of the sultan of Johore by the E. I. Comp. in 1819. It was then an inconceivable village; but Sir Stamford Raffles, who recommended the purchase, clearly apprehended the advantages of its situation for a commercial *entrepôt*, and the importance of its occupation. It was placed at first under a resident, but had no organised government for several years afterwards. Mr. Crawford, author of the able work on the Eastern Archipelago, was governor of Singapore from 1823 to 1826. The governor is now assisted by a council of several salaried officers, and a recorder's court has been established. The military force consists of a wing of the Madras native regiment, and a small detachment of artillery. The public revenue, derived from an excise on the consumption of pork, opium, and home-made spirits, government rents, dues, fines, &c. amounted at an average of the three years from 1833 to 1836, to 254,575 Sp. doll. a year; and the expenditure for the same period to 243,221 ditto. (*Newbold.*)

The town of Singapore is, as already seen, situated on the S. side of the island, on both banks of the rivulet or salt creek of its own name, stretching thence E. for about 1½ m. to another small creek of the same kind. Its central part is occupied with the dwellings of the merchants and the military cantonments; the Malay quarter is at the E., and the principal Chinese and commercial quarter at the W. extremity, on the right bank of the rivulet, crossed by a wooden bridge. The streets are in general regularly laid out, and the houses superior to those of Penang, though the best are only of brick. On a hill N. of the town is the government house, the other principal buildings are the court-house, gaol, new custom house, missionary chapel, Armenian church, and the Singapore Institution, founded by Sir S. Raffles, for the cultivation of the languages of China, Siam, and the islands of the Malay archipelago. At present it has an English, a Malay, and a Tamil school, and about 70 pupils; it receives a small pension from government, but is principally dependent on subscription. Ships lie in the roads, or outer harbour, at from 1 to 2 m. from town. The assistance of a number of convenient lighters, which are always in readiness, enables ships to load or unload with scarcely any interruption throughout the year; and the creek being accessible to the lighters for three-fourths of a mile inland, the goods are taken in and discharged at convenient quays before the principal warehouses.

On a small island, about 60 m. S.E. Singapore, is the Dutch settlement of Rhio, the seat of a Dutch resident, with about 24,000 inhabs. It was originally settled in 1785, and colonised a second time by the Dutch in 1818; but its trade has been almost wholly superseded by that of Singapore. (*Newbold's British Settlements in Malacca, &c.* i. 296-399; *Crawford's Embassy to Siam*, ii. 345-465; *Malcom's S. E. Asia*; *Singapore Free Press*, &c.) SINIGAGLIA, or SENEAGLIA (an. *Sena*, *Gallica*), a town of central Italy, Papal States, leg. Urbino, on the Misa, about ½ m. from its mouth. It is regularly, 17 m. W.N.W. Ancona. Pop. 7,000. It is regularly, though not strongly, fortified with a mound and bastions, and the gates are handsome. Its cathedral, of the Co-

rhinian order, in the form of a Greek cross, has some good paintings, but nothing else very remarkable. The streets are broad, and the town has a neat appearance; but it is indifferently supplied with water, and is said not to be very healthy.

Sinigaglia is the seat of the greatest of the Italian fairs. The fair commences on the 14th of July, and should terminate on the last day of that month; but it usually continues 5 or 6 days longer. The duties on goods brought to the fair are extremely moderate, and every thing is done to promote the convenience of those frequenting it. All sorts of cotton and woollen goods, lace, iron and steel, hardware, jewellery, brandy and liquors, raw and refined sugar, dried fish, cacao, coffee, spices, &c. are brought thither by the English, French, Austrians, Americans, Swiss, &c. These are exchanged for the various raw and manufactured products of Italy, and the Levant; consisting, among others, of raw, thrown, and wrought silk; oil, fruits, cheese, alum, soda, smut, sulphur, &c. The value of the imports at some recent fairs has been estimated at about 2,000,000*l.* Accounts are kept in gold of 20 soldi; the scudo = 4*s.* 4*d.* very nearly; 100 *l*sc. Sinigaglia = 73*l* 1*s.* avoirdupois. The ell, or braccio, measures 25·33 English inches.

The port belonging to the town, at the river's mouth, is fit only for small vessels. Sinigaglia is a bishop's see. According to Polybius, it was colonised by the Romans, A. V. C. 471. Having espoused the cause of Marins, it was taken and sacked by Pompey. (*Commercial Dict.*; *Cramer, Anc. Italy*, i. 288.)

SISTOW, or SISTOVA, a town of European Turkey, prov. Bulgaria, on the Danube, which is here more than 2 m. broad, 36 m. W.S.W. Kustchuk. Pop., estimated in Horschelmann Stein, at only 10,000; but by other authorities at 20,000 and upwards, including many Armenian and Greek merchants. It occupies a large extent of ground, surrounded by a wall, and a dry ditch. Mr. Quin says, "Sistow is a beautifully situated. A range of well-wooded hills commences a league or two to the W., and extends a considerable way along the right bank of the Danube. The town, rising at the water's edge, winds its way up the undulations of the eminences. After ascending for a while, the houses are lost; then they appear higher up, and the whole is protected by a citadel, which crowns the summit." (*Scam Poyage on the Danube*, i. 288.) "Sistow has some trade in leather and cotton. It was here, in 1791, that a treaty of peace was signed between Austria and Turkey, after the latter had lost Rimnik, Ismail, &c. to the Russians. (*Stoll's Germany and Russia*, &c.)

SITTINGBOURNE, a town and par. of England, co. Kent, lathe Seray, hund. Mton, on the road from London to Canterbury, 12 m. W. by N. the latter. Area of par., 1,260 acres. Pop., in 1831, 2,182. It consists chiefly of one wide street, running along the high road, and has several good inns. The parish church, a spacious building, has been mostly renewed since 1762, when it was destroyed by fire. The living, worth 212*l.* a year, is in the gift of the archbishop of Canterbury. In 1508, Queen Elizabeth incorporated Sittingbourne under a mayor and jurat, with the privilege of sending 2 members to the H. of C., and of holding a weekly market and fairs; but these privileges seem never to have been exercised, except as respects the fairs, which are held on Whit Monday, Tuesday, and Wednesday, and Oct. 10. The markets are held once a month.

SIVACHE, or PUTRID SEA, the *Palus Patris* of the ancients, a lagoon on the east side of the Crimea. On the N. it communicates with the sea of Azoff, by the narrow strait of Yenitchi, being every where else separated from it by a narrow, low, sandy tongue of land, stretching N.N.W. from Arabat in the Crimea to opposite Yenitchi, a length of nearly 70 m. The lagoon is shallow, and its W. side, forming the E. shore of the Crimea, is extremely irregular. When the wind blows from the E., the water of the sea of Azoff is forced through the strait of Yenitchi, and covers the whole surface of the lagoon; but at other times it exhibits a large extent of mud, the exhalations from which are, in summer, exceedingly unhealthy. The Salghir, the principal river of the Crimea, falls into this lagoon.

SKIBBEREN, a town of Ireland, prov. Munster, in the most southern portion of the co. Cork, on the Rhen, which is navigable from Baltimore to within 3 m. of the town, 40 m. S.W. Cork. Pop., in 1831, 4,430. It is a brisk, thriving town, and has a considerable retail trade. It has a par. church, a Rom. Cath. chapel, a Methodist meeting-house, several schools, a dispensary, market-house, barrack, court-house, and bridewell. Petty sessions are held on Wednesdays; and it is a constabulary and coast-guard station. It has several large flour-mills and a brewery. The exports, which principally consist of corn, meal, flour, and provisions, are mostly shipped from Oldcourt, 2 m. lower down the river, where vessels of 200 tons load and unload. Markets on Wednesdays and Saturdays: fair May 14, July 19,

Aug. 2, Oct. 12, and Dec. 11, and 23. Post-office revenue, in 1830, 507*l.*; in 1836, 833*l.* A branch of the Agricultural Bank was opened in 1835.

SKIPTON, a market-town and par. of England, W. riding co. York, wapentake Staincliffe and Ewercross, E. div., in the mountainous distr. of Craven, and on the Aire, 38 m. W. York. Area of par., 26,760 acres. Pop., in 1831, 6,193. The town, consisting principally of one spacious street, is built wholly of stone from the neighbouring hills. The par. church has some monuments of the Clifford family. The living, a vicarage in the gift of the Dean and Chapter of Christchurch, is worth 185*l.* a year. The Friends, Independents, and Wesleyans, have meeting-houses; and there is a flourishing grammar-school, founded in 1528, the pupils of which are eligible to the exhibitions of Lady E. Hastings at Queen's College, Oxford, and to two exhibitions in Christ's College, Cambridge. The town has also another endowed, or Clerk's school, a national school, &c.

Near the church is Skipton Castle, the seat of the Earl of Thanet, supposed to have been originally built soon after the conquest. Though not well placed for a fortress, it was of some consequence in that capacity during the wars of Charles I. It was dismantled in 1646, but is now a splendidly fitted up noble residence. Skipton is governed by a constable elected annually at the manorial court-leet; and the general quarter sessions for the W. riding are held in its town hall. It has some paper and cotton mills, and a considerable trade in corn, sheep, and cattle, much facilitated by the Leeds and Liverpool Canal, which passes close by the town. Market day, Saturday. Fairs, March 25; Palm Sunday eve, Easter eve, and three Tuesdays next after Easter, for horses, cattle, and sheep; Whitson eve, Aug. 5, Nov. 20, and 23, for horses, woollen, and linen cloths, meercery and pedlery.

SKYE, one of the Hebrides, which see.

SLAVONIA, or SCLAVONIA (Hungar. *Tot-Ország*), a prov. of the Austrian empire, usually regarded as forming a part of Hungary, and chiefly included within its military frontier; between the Drave and Danube on the N. and E., and the Save on the S., dividing it from Servia, Bosnia, and Turkish Croatia, and having Austrian Croatia on the W. Area, estimated at about 3,600 sq. m.; pop. 315,000, principally Slavonians of the Greek church; but partly, also, German colonists, Gypsies, and Jews. A branch of the Carnic Alps, almost wholly of calcareous formation, runs E. and W. through Slavonia; but these mountains are of no great elevation, and a large part of the surface is flat. The plains are very fertile, though frequently unhealthy from the presence of extensive marshes along the large rivers. Wheat, rye, oats, barley, and most other grains, are produced in abundance, besides flax, hemp, tobacco, madder, &c. A good deal of strong wine is made, especially in Sirmia. Fruit is extremely plentiful, and there are vast orchards of plums, whence the favourite liquor *slivovitz* is distilled. The hill ranges are covered with forests, consisting of excellent oak, &c. The breeding of live stock, particularly of hogs, which feed at large in the forests, is extensively pursued. The silkworm succeeds, but it is not much reared. The prov. is said to possess iron, salt, sulphur, and perhaps coal; but marble only is raised in any quantity. Manufactures, mostly domestic, excepting some of glass and earthenware, potash, &c. The trade partly consists in the exportation of the raw produce of the prov., and partly in the transit of products. The principal articles of export are cattle and hogs, which go to the most distant provs. of the Austrian empire; hides, skins, rye, wheat, honey and wax, galls, timber, &c. Slavonia is divided into 3 counties, and 4 military districts: chief towns, Essek, the cap., Peterwardein, and Posega.

Slavonia and the Banat comprise the most important portion of Hungarian military frontier, the system of defence organised in which deserves some notice. "The object has been to maintain, at the least possible cost, along the whole Turkish frontier of Hungary, a force which, in peace, might be employed for the purposes of quarantine and customs, and in war serve as a portion of the standing army. This has been effected so perfectly, that in peace nearly 40,000 men do duty along 800 m. of frontier; and they not only feed and clothe themselves, but pay heavy taxes in money besides, and perform, also, a considerable quantity of labour without pay. The land acquired by government along the whole of this district is held as fiefs on the tenure of military and civil service, from 36 to 50 acres constituting a fief. Each of these is bound to furnish, and to maintain and clothe, according to its size, one or more men-at-arms. The fiefs are given to families composed of several members, of which the eldest is the *house-father*, and who, with the *house-mother*, has the direction of the farm, the care of the house, and the right to control the whole family. The fiefs are not sold: the land is cultivated for the common use of all the members of a family; and the produce may remain after the taxes and other expenses are

deprayed, is divided among them. In most cases, many married couples, with their children, sometimes to the number of 50 individuals, live under the same roof, cultivate the same land, eat at the same table, and obey the same father. The border-family has to do civil service for the state, as in the repair of post-roads and bridges, draining of swamps, &c., one day per annum for every English acre, and 8 days a year for the village. The borderer's chief tax, besides the furnishing the uniform (government supplying the arms, boots, &c.), is the land-tax, amounting, for an entire field, to from 15s. to 30s. a year. In time of peace, the man-at-arms repairs to his military station for 7 days at a time, where the family provides him with food. Besides this, he has the duty of translating letters, as well as the money and baggage of his regiment, and of performing exercise. For the ordinary service, the number of men on duty amounts to 4,180. In times of disturbance on the Turkish side, or when the plague is drawing near, it is increased to 6,800, and in times of still greater danger, to 10,000. In time of war, the borderer must form a part of the regular army, and march out of the country if required. The regular disposable force amounts to 31,800 men; but if the reserve and the *landwehr* be called out, to 100,000. If driven to the last extremity, they can muster to the amount of 200,000 men. (*Caspary's*.) By means of alarm-fires and bells, this immense force may be summoned together through the whole extent of the frontier in the space of 4 hours! The borderers are divided into 7 regiments. Every regiment receives its orders ultimately from the council of war at Vienna. The Hungarian Diet has no control over the levy and supply of these troops; and the schools, the language of the service, and many of the laws in the military border, are exclusively German." (*Page's Hungary*, &c., ii. 93-103; *Caspary's*, *Geschichte von Ungarn*; *Oesterl.*, *Nat. Enzyklop.*)

**SLEAFORD (NEW)**, a market-town and par. of England, co. Lincoln, wapent. Flaxwell in Kesteven, on the Slea, 16 m. S.S.E. Lincoln. Area of par., 3,160 acres. Pop. in 1831, 2,587. The town consists principally of three streets, and has a prosperous appearance. The church, founded in 1271, is interesting for its architecture. The tower, at the W. end, is much the oldest part, and is early English; but surmounted by a spire, 144 ft. in height, of a later date. The aisles, transept, &c. are in the decorated, and the chancel and other parts in the perpendicular style. The whole of the details of this church, in all its styles, are very good. (*Rickman's Gothic Archit.*) In the chancel are several monuments to the Carr family, one of whom founded and endowed a free-school in the town, and an hospital for 12 poor men. The school was closed from 1816 to 1835, during which period the school-house was rebuilt; in the latter year it was re-opened, when it had an income of 189*l.* a year. There are several other charities, particularly Alvey's school, for 40 children, which has received many endowments since that of its founder. (*32d Rep. on Charities*, part iv.) Formerly the bishop of Lincoln had a palace at New Sleaford, but it no longer exists. A new Gothic session house has lately been built, in which petty sessions are held; and various other improvements have been effected in the town. The living, a vicarage worth 170*l.* a year, is in the gift of the prebendary of Lincoln Cathedral. Market days, Mondays; fairs, Plow, Easter, and Whit Monday, for horses, cattle, and sheep; Aug. 13. for provisions; and Oct. 20. for cattle and sheep. (*Parl. Reports*, &c.)

**SLESWICK** (Germ. *Schleswig*), a duchy belonging to Denmark, comprising the S. part of the peninsula of Jutland, between lat. 54° 15' and 55° 30' N. and long. 8° 40' and 10° 10' E., having Jutland Proper to the N., S. Holstein, from which it is separated by the Eyder; E. the Baltic, and W. the North Sea. Area, including the adjacent islands, 3,450 sq. m. Pop., in 1835, 338,132. Surface low, and generally flat, being in parts varied only by a few undulating hills. Almost the whole of its western coast is either below or elevated very little above the sea, being defended from its irruptions (from which, however, it has frequently suffered much) by numerous dykes and sluices. The country so protected consists principally of very rich marsh land, affording pasturage for large herds of very superior cattle, as well as great numbers of fine horses. In the interior the soil is sandy, interspersed with heaths, and not very productive, but on the eastern side it is fertile. There are no minerals of importance. The produce of corn, consisting principally of rye and barley, is sufficient for home consumption; and flax, hemp, and potatoes, are also grown. But the raising of cattle and horses forms the staple employment; and these, with butter and cheese, form the principal articles of export. The fishery is carried on to some extent. The deficiency of timber for fuel is compensated by the abundance of turf. The country is mostly open; but it is in parts inclosed with quickest hedges, and the farm-houses are neat, and have a comfortable appearance. The manufactures, which are unimportant, consist mostly of linen, hempen, and wool-

len fabrics, made in the peasants' cottages. Lace is produced at Toudern, and there are a few paper, tile, and other factories. Flensborg is the principal place of trade: Sleswick, Kiel, and Tonnungen, are the other chief towns. This duchy preserves several of its ancient laws and institutions; feudal vassalage, however, was abolished in 1805.

**SLESWICK**, a sea-port town of Denmark, cap. of the above duchy, at the bottom of the long, narrow gulph, or arm of the sea, called the Sley, 21 m. from its mouth, and 70 m. N.N.W. Hamburg; lat. 54° 31' 18" N., long. 10° 34' 45" E. Pop., according to Hirschmann's *Stein*, 11,000. Though irregularly built, its brick houses, neatness, and manner of building, make it look like a Dutch town. It has 3 churches, including the cathedral, with several monuments, and a remarkable altar-screen; several hospitals, a deaf and dumb asylum, schools for the poor, a patriotic union, and other societies, a nursery, a savings' bank, with manufactures of lace, woollen stuffs, earthenware, &c. Its commerce has been a good deal increased since the improvements in the navigation of the Sley; still, however, it is accessible only by the smaller class of vessels. It was formerly a member of the Hanseatic league, and a town of some note as early as the 9th century. In its immediate vicinity is the castle of Gottorp, formerly the residence of the duke of Holstein-Gottorp, and now occupied by the governor of the duchies of Sleswick and Holstein. (*Stein's Handbuch der Geogr.*, &c.)

**SLIGO**, a marit. co. of Ireland, prov. Connaught, having N. the Atlantic Ocean, E. the co. Leitrim, S. E. Roscommon, and S. W. and W. Mayo. Area, 431,887 acres, of which 168,711 are mountain and bog, and 8,760 water. Surface much diversified; but though it has a considerable extent of level rich land, it is, speaking generally, mountainous, rough, and boggy. There are a few pretty large estates; but a considerable portion of the co. is divided among small proprietors. The statements as to the mode of occupying land, its management, and the condition of the inhabs., given under the notice of the co. LITRIM (which see), may be applied, with little or no modification to this co. The great increase within the last few years in the amount of the exports from the town of Sligo, show that there must have been a corresponding extension of cultivation in this co. and the contiguous portions of Leitrim. But unhappily the extension, and even improvement of tillage in Ireland, is not always accompanied by any corresponding improvement in the condition of the occupiers, which is here extremely bad. The *conacre* system (see *ante*, p. 40) has made much progress in this co.; the competition for land is extreme; and the occupier of any overrated patch that may choose to part with it, never fails to get a considerable sum "tenants' right." Average rent of land, 1*l.* 8*s.* an acre. It has neither minerals nor manufactures of any importance. Principal rivers, Garvey, Arrow, Awinsmore, &c. It is divided into 6 baronies and 39 parishes, and returns 3 members, to the H. of C., two being for the co. and one for the bor. of Sligo, the only town of any importance in the co. Registered electors for the co., in 1831, 1,574. In 1831, Sligo had 25,588 inhab. houses, 32,203 families, and 171,765 inhabs., of whom 83,730 were males, and 88,035 females.

**SLIGO**, a par. bor. and sea-port town, on the W. coast of Ireland, prov. Connaught, cap. of the above co., at the bottom of Sligo Bay, and at the mouth of the river Garvey, 107 m. N.W. Dublin; lat. 54° 22' N., long. 8° 22' W. Pop., in 1821, 14,151; in 1831, 15,182. The town, which is of considerable importance, and increasing both in wealth and population, is intersected by the Garvey, which has its source in Lough Gill, distant about 3 m. The larger portion, which is on the S. side of the river, is connected with that on the N. by 2 bridges. The streets are irregularly laid out, and those in the older parts of the town are narrow, dirty, badly paved, and badly lighted. Of late years, however, several new markets, warehouses, and lines of streets, have been erected; and it has a good deal of the bustle and appearance of a place of trade. Water is supplied by public pumps. The town has a library, 2 news-rooms, a small theatre, and a cavalry barrack. The ecclesiastical buildings comprise the par. churches of St. John and Calry; a large Rom. Cath. chapel, a Dominican convent, and places of worship for Presbyterians, Independents, and Wesleyan Methodists. The ruins of Sligo monastery deserve notice for their architecture and for a monument of O'Connor Sligo, who died in 1623. There are 2 par. schools, a school in connection with the Board of National Education, one on the foundation of Erasmus Smith, and one under the Incorporated Society. The County Infirmary, Fever Hospital, and Dispensary, and a mendicity association, are within the town. Lunatics are sent to the district asylum for Connaught, at Ballinacree.

The bor., which was chartered by James I. in 1614, is divided, under the Irish Municipal Reform Act, 3 and 4 Victoria, cap. 108., into 3 wards, and is governed by a

provost, 5 other aldermen, and 18 councillors. Sligo returned 2 mems. to the Irish H. of C., and since the Union it has sent 1 mem. to the Imperial H. of C.

The boundary of the parl. bor. extends 1 Irish m. from the market cross in every direction. Registered electors, in 1839-40, 1,131. The boundary of the municipal bor. is, however, of more limited dimensions. A board of commissioners, appointed under local acts, superintends the police of the town, and the improvement and regulation of the quays and harbour, with power to impose rates for those purposes. Under their management, the port has been a good deal improved. An extensive new quay and warehouses have been erected outside the bar; and though rather difficult of access, the port is now very tolerable. There are about 12 ft. water close to the quay, so that vessels of 250 and 300 tons come up to the town. The assizes and general sessions of the peace for the co. are held here; the latter four times in the year; and petty sessions every Thursday. The court-house, though a modern structure, is too small for the convenient despatch of business. The co. gaol, a large and well constructed building on the polygonal plan, is furnished with a tread-mill.

The linen trade, which was formerly carried on with some spirit, is now nearly extinct. The town has several flour mills, a distillery, and four breweries. The markets for corn and butter, on Tuesday and Saturday, are held in buildings erected for the purpose. There is a valuable salmon fishery close to the town.

Sligo is the *chef-lieu* of an extensive country, and has, in consequence, a considerable and increasing trade. The exports consist almost wholly of agricultural produce: thus, in 1835, the total estimated value of the exports amounted to 359,496*l.*; of which the value of corn, meal, and flour made 185,414*l.*, and that of provisions (beef, pork, &c.) 181,834*l.* The imports consist of colonial products, English goods, tobacco, wine, coal, salt, &c. for the use of the town and the country dependent upon it. Gross customs' revenue in 1840, 32,000*l.* Post-office revenue in 1839, 2,269*l.*; in 1836, 2,690*l.* Branches of the Bank of Ireland, the Provincial Bank, National, and Agricultural do., are established in the town, which has also two newspapers.

The intercourse between the port and Lough Gill, and the surrounding country, by the Garvey, is prevented by a dam thrown across the latter for the use of the large flour mills. This obstruction is much complained of, and will, probably, at no distant period, be removed. The country in the vicinity is highly picturesque, and has many fine seats. The pop. is comparatively respectable and well off. (*Boundary and Railway Reports, &c.*)

SMOLENSKO, a government of European Russia, between the 53d and 57th degs. of N. lat. and the 30th and 26th E. long., having N. the governments Pskov and Tver, E. Moscow and Kaluga, W. Witbesk and Moghilef, and S. Orlov and Tchernigof. Area estimated at 20,220 sq. m.; pop. in 1838, 1,061,200. Surface mostly an undulating plain, in some parts marshy; in the N. is a more elevated plateau, in which the Dnieper and several other rivers have their source. The soil is generally fertile, and more corn, principally rye, is grown than is required for home consumption. Hemp, flax, tobacco, and hops, are cultivated. Cattle breeding is less attended to; but a good many hogs are reared. The forests are very extensive, and are, in fact, the chief sources of wealth. Game is very plentiful, and bees are reared almost every where. Iron, copper, and salt, are found. Manufactures few, being nearly confined to leather, glass, wares, pitch, &c.; with sawing works, distilleries, and a few carpet factories in the cap. The raw produce of the government is exported, in large quantities, to Riga, Wilna, and Moscow. It is divided into 12 circles.

SMOLENSKO, a town of European Russia, cap. of the above gov., on the Dnieper, 230 m. W. by S. Moscow, lat. 54° 47' 11" N., long. 32° 3' E. Pop. nearly 10,000. It is situated on both sides the river, and is surrounded by a massive wall flanked with towers. It appears to advantage at a distance, but is in reality a poor town, the houses being mostly of only one story, and built of wood; but since it was burned by the Russians, previously to their evacuating it on the advance of the French in 1812, it has been partially rebuilt of stone and brick.

Smolensko has 3 cathedrals, in one of which is a bell weighing 850 cwt.; 16 Greek churches; 3 convents; a Lutheran and a R. Catholic church; a seminary; gymnasium; a military school for nobles; several hospitals; and some carpet, hat, soap, and leather factories. In 1838, the erection of an iron pyramid was commenced here, intended to commemorate the resistance made by the town to the French in 1812.

Smolensko is of considerable antiquity. It has suffered numerous vicissitudes, but has always been a town of some consequence. (*Schmitzer, La Russie; Possart, Das Kaiserthum Russland.*)

SMYRNA, an ancient and celebrated city and sea-port

of Asia Minor, the greatest emporium of W. Asia, on the W. side of the Meles, a stream which, though of small dimensions, has acquired an immortality of renown, at the bottom of the gulph of its own name (an. *Hermius Sinus*), lat. 38° 25' 36" N., long. 27° 6' 45" E. Its pop. may be estimated at from 120,000 to 150,000, more than half being Turks, and the rest Greeks, Jews, Armenians, Franks, &c. It is surrounded, at some distance, by an amphitheatre of lofty mountains, which leave it open only towards the sea; and immediately adjoining the city, on the W., is the ancient *Mons Pagus*, which commands a noble view. This eminence is now called the Castle Hill, from a citadel erected on its summit, in the 13th century, by the Emperor John Comnenus. "A triangular plain, spread at the foot of this hill along the shore, and the slopes of the hill itself, compose the site of Smyrna. One side extends along the shore from W. to E. for about 24 m. The Turks occupy the upper part of the city, their streets hanging down the slopes of the hill; the Armenians are in the centre; the Jews have two or three different places around both; and the Franks spread themselves in the flat ground and close to the shore. Extending S.E. is a plain filled with gardens; and every part of the city is interspersed with shady trees." (*Burgess's Greece and the Levant*, ii. 67, 68.)

The view of Smyrna from the bay, rising amphitheatrically from the water's edge, backed by the hill crowned with its old castle, is grand and impressive. Unfortunately, however, its interior has all the odious features common to most Turkish towns. "If a first view be calculated to make a favourable impression, this is not confirmed by an inspection of the interior of the city. The Frank quarter is dirty, ill paved, and narrow; in addition to which, it is rendered almost impassable by long strings of cubers and porters carrying huge bales of cotton. The houses (excepting those of the consuls and principal merchants, which are large and commodious) are miserably built; the sides consist often of planks; and when of bricks, the walls are too thin to keep out cold and damp. Neither windows nor doors are made to shut close; and if locks appear on the latter, it is too much to expect that they should be serviceable. There is a great lack of accommodation for travellers. The only inn in the town contains but a single decent room; and the noise of revelry is incessant. Besides this, there are three boarding-houses; but furnished lodgings are not to be procured, nor can furniture be hired for a few weeks or months. The apparatus commonly used for supplying warmth to the body in cold weather, is a brazier placed under the table, which is covered by a large cloth held by each member of the family circle up to the chin, to prevent the heat from escaping. Grates and stoves have of late years been introduced; but they are still rare, and to be seen only in Frank dwellings. The shops are little dark rooms, but tolerably supplied with European articles. The bazars, with their long covered rows of stalls, built with sundry precautions against fire, whose ravages are awfully common, are secured by iron gates closed at night. As to the rest, Turkish towns in general offer little variety, and the description already given of Constantinople applies to Smyrna, except as regards the finer buildings, greater extent, and gaudy exterior of the capital." (*Elliott's Travels*, ii. 34—36.)

The principal buildings of Smyrna are, the bazaar and *bazaar*, or market-place; the *shaher-khan*, constructed of the marble ruins of the ancient theatre; the palace of the *mudshim*, or governor, and the various mosques, churches, hospitals, &c. There is a large public hospital in the N.E. part of the Frank quarter, supported by the Greeks, Franks, and other Christians, which ranks high in Turkey for its school of medicine. Its buildings comprise a laboratory, and three sets of wards around a court-yard shaded by rows of trees. The castle on Mount Pagus is very extensive, and occupies the site of the ancient acropolis. This fortress has been frequently repaired by the Turks, and accordingly presents an incongruous intermixture of architecture; but it is now mostly deserted, and in ruins, though a few old cannons are still mounted on its walls. Within are some vaults and cisterns, supposed to be coeval with its foundation; and a large but abandoned mosque, formerly a church dedicated to St. Polycarp, bishop of Smyrna, who is supposed, though on no very good authority, to have suffered martyrdom near the same spot.

Smyrna was the seat of one of the seven Apocalyptic churches. (Rev. ii. 9.) And, according to Mr. Elliott, "there is not one of these churches within whose precincts the trumpet of the gospel now gives so distinct and certain a sound. While Mohammed is acknowledged in 20 mosques, and Jews assemble in several synagogues, the faith of the Messiah is taught in an Armenian, 5 Greek and 2 R. Catholic churches, and in 2 Protestant chapels, one connected with the English, the other with the Dutch consulate." (*Trav.* ii. 48, 46.) The Armenians have a large academy at Smyrna.

Being surrounded, as already stated, by an amphitheatre of mountains, which concentrate the rays of the sun and interrupt the breeze, the heats at Smyrna, from June to the middle of Sept., are usually intense; and if the *inhab.* or sea-breeze, fall, the *inhab.* are almost suffocated. This great heat and want of ventilation, joined to the filthy and crowded state of the streets and houses, and the want of any efficient precautions on the part of the authorities, seldom fails to generate the most destructive diseases; among which, the plague not unfrequently makes its appearance, and commits dreadful ravages. At such periods all commercial and social intercourse immediately ceases; and the Frank *inhab.* retire to and shut themselves up in their country houses in the surrounding villages. The Turks, who are firm predestinarians, have hitherto taken few or no precautions to counteract the progress of the infection, or to guard against it; but it is stated by late travellers that some change is now beginning to take place in this respect, and that the principal Turkish *inhab.* are slowly adopting some of the devices by which Europeans attempt to ward off the maledict. (*Chandler's Asia Minor*, chap. 19.; *Burgess*, li. 76.)

*Port and Commerce.*—Though frequently overthrown by earthquakes, and laid waste by hostile incursions, the excellence of her port, and her advantageous situation for commerce, has always made Smyrna be rebuilt; and she still continues to be a great city, while Ephesus, Miletus, and other celebrated emporiums on the same coast, have, from the filling up of their harbours, been long since reduced to total ruin. The Gulf of Smyrna, the entrance to which is between the island of Mytilene on the N., and Cape Carabouron on the S., is deep and angular, the distance following a ship's course from the entrance to the city, being about 11 nautical leagues. There is excellent anchorage in most parts of the Gulf, merely avoiding the shoals on its N. side. Ships of large burden usually anchor abreast of the city in from five to seven fathoms; but the water is so deep that they may lie close alongside the quays. The *inhab.* or sea-breeze, blows from morning till evening during the hot months, and is always waited for by ships going up the city; and there being no obstructions in the way, the services of pilots are not required. In the night a land breeze generally blows from the city out to sea.

The principal articles of import consist of grain, furs, iron, butter, &c., from Odessa and Taganrog; and of cotton stuffs and twist, silk and woollen goods, coffee, sugar, cochineal and dye woods, iron, tin, and tin plates, rum, brandy, paper, cheese, glass, wine, &c., from Great Britain, France, Italy, the U. States, &c. Coffee is, perhaps, the most considerable article: it comes principally from America and England, and the annual consumption is estimated at 3,000,000 *okes*.

The exports consist principally of raw silk and cotton, the former produced about Brusa, and sent chiefly to England; fruits, particularly raisins, and figs; opium, which goes chiefly to America and Holland; rubbers, and a variety of drugs and gums; olive oil, madder roots, Turkey carpets, valance, sponge, galls, wax, copper, hare-skins, from 350,000 to 400,000 annually; goats' wool, safflower, &c. Burgess, who visited Smyrna in July, 1834, says, "British commerce, if I may judge from the present state of the harbour, is by far the most considerable. There are now 30 vessels under cargo, of which more than a half are bound for Great Britain and Ireland. The English appear to engross the commerce of fruit; the French of cotton; the Dutch trade is entirely fallen off." (ii. 80–85.) The principal foundation of the commerce of Smyrna consists in the caravans, composed principally of Armenians, that arrive from Persia and the East, at fixed periods, which are nearly identical with those of the arrival and departure of most of the foreign ships frequenting the port. They carry to and convey away the greater portion of the exports and imports. Burgins are principally effected by Jew brokers, many of whom have amassed considerable fortunes. Upon an average, the selling charges, generally, may be calculated at about 12 per cent., and the charges on purchasing at about 8 per cent. The money, weights, and measures, are mostly the same as at Constantinople. Accounts are kept in piastres of 40 paras. The value of the piastre fluctuates according to the exchange; but, in 1831, Burgess received 97s for 1*l.* sterling, and the Spanish dollar, at the same time, was worth 21s piastres. The *oke*, which is the principal weight = 12 lbs. 13*oz.* avoird.; the quintal = 127.48 lbs. avoird. (*Com. Dict.*)

Smyrna is well supplied with provisions of all kinds. Fish, including red mullet, oysters, &c., are very plentiful in the bay; and game of all kinds, mutton, the flesh of wild boars, &c., are good and abundant. Whey and clotted cream are used in great quantities. Sweet lemons, oranges, citrons, water-melons, figs, and grapes, are grown in great perfection in the environs, particularly at Menemen, and the other villages on the opposite side of the Gulf; whence boats carrying fruits and

other provisions, are continually passing to Smyrna. Mr. Burgess gives the ordinary prices of certain articles as follows:—Eggs 4 to 6 paras each; milk 30 do. per *oke*; a small loaf 6 or 8 do.; melons 20 paras the *oke*, grapes 30 do.; mutton 2 piast. 10 par. the *oke*; beef little more than half that price, &c.

Most travellers speak of the agreeable society met with in Smyrna; and the Greeks of the city have begun to adopt the manners and costumes of western Europe. *Historical Notice.*—The accounts of the foundation and early history of Smyrna are obscure and somewhat contradictory. The most probable seems to be that it was founded by a colony from Ephesus. (*Strabo*, lib. xiv.) After undergoing various vicissitudes, it was destroyed by Alyattes, king of Lydia, the *inhab.* being dispersed among the surrounding villages. At the distance of about 400 years, a project for reconstructing the city would appear to have been entertained by Alexander the Great; but, if so, it was not carried into effect by that conqueror, but by Antigonus and Lysimachus. The city built by them was not, however, on the site of the old city, which stood on the flat shore on the other side of the Meles, about 24 m. N.E. from the modern city. The admirable port and other advantages enjoyed by the newly built city rendered it in a short time one of the most populous, wealthy, and handsomest of the Asiatic cities. "It is," says Strabo, "the finest city of Asia. Part of it is built on a hill; but the finest edifices are on the plain not far from the sea, over against the temple of Cybele. The streets are the most beautiful that can be, straight, wide, and paved with freestone. It has many stately buildings, magnificent porticoes, majestic temples (including a *Homerion*, or temple in honour of Homer), a public library, and a convenient harbour, which may be shut at pleasure." (lib. xiv. *sub init.*) Under the Romans Smyrna enjoyed the greatest consideration, and Marcus Aurelius rebuilt the city, after it had been almost destroyed by an earthquake. It was much frequented by the Sophists; and, along with Ephesus, became renowned as a school of oratory and science.

In more modern times it has undergone innumerable calamities, from which, as already stated, nothing but its admirable situation for commerce could have enabled it to recover. It was taken and given up to military execution by the famous Tamerlane, or Timur Bec, in 1402; and finally came into the possession of the Turks, in 1424.

Smyrna is one of the numerous cities that contended for the honour of being the birth-place of Homer; and Chios, perhaps, excepted, she would seem to have the best claim to this proud distinction. *Homeri Smyrneni suum esse confirmant; itaque etiam delubrum ejus in oppido dedicaverunt.* (*Cicero pro Archia*, cap. 8.) From being born on the banks of the Meles, which washed the walls of the ancient as well as of the modern city, Homer is sometimes called *Melesigenes*.

"Blind Melesigenes thence Homer call'd,  
Whose poem Phœbus challeng'd for his own."

Thence, also, Tithulus (lib. iv. eleg. i. v. 210.) calls his poems *Melesius Chartas*; and Pausanias says (*Archæol.* cap. 5.), that a cave was pointed out at the source of the Meles, where they were said to have been composed.

Owing to the influence of earthquakes, and the still more destructive attacks of barbarians, Smyrna has but few considerable remains of antiquity. They consist principally of portions of the old walls, especially along the castle-hill, with some vestiges of the theatre and stadium. Many pedestals, statues, inscriptions, and medals, have been and are still discovered in digging; and perhaps no place has contributed more than this to enrich the collections and cabinets of Europe.

It has been supposed by Chandler and others, that the mud and other detritus brought down by the Kodrus (an *Hermus*), which has its embouchure on the N. side of the Gulf, will, in the end, fill up the channel; and by depriving the city of its port, effectually consummate its ruin. But though this effect may ultimately be brought about, it is abundantly certain, comparing the banks at the river's mouth with the space that has to be filled up, that a lengthened series of ages must previously elapse.

Besides the authorities already referred to, see *Ancient Universal History*, vii. 410, 8vo. ed. &c.

SNOWDON, a mountain of N. Wales, in Caernarvonshire, being at once the highest in the range of which it forms a part, and in S. Britain. The mountain, which is about 10 m. S.E. from Caernarvon, terminates in various peaks; the particular peak, the Wyddva (conspicuous), to which the name Snowdon is more particularly applicable, and which scarcely out-tops several of the surrounding summits, is 3,571 ft. above the level of the sea. The W. side of the mountain is very precipitous, and is composed partly of pentagonal basaltic columns. The view from the summit is very extensive. "I saw from it," says Pennant, "the city of Chester, the high hills of Yorkshire, part of the N. of England, Scotland, and Ireland; a plain view of the Isle of Man; and that

of Anglesey lay extended like a map before me, with every hill visible." (*Tour in Wales*, ii. 337, ed. 1810.)

#### SOCIETY ISLANDS. *See* POLYNESIA.

**SOCOTRA** (an. *Dioscoridis Insula*), an island in the Indian Ocean, about 230 m. from the S. coast of Arabia, and 120 m. E. Cape Gardafui, in Africa; its chief town being in lat.  $12^{\circ} 39' 22''$  N., long.  $54^{\circ} 6' 29''$  E. It is of an elongated shape. Area estimated by Mr. Wellsted at 1,000 sq. m. Pop. probably 4,000 or 5,000, principally Bedouins, with some settled Arabs, African slaves, and descendants of Portuguese. The S. coast of Socotra preserves a convex and nearly unbroken line, but on the N. it is indented with many bays and harbours. The interior may be described as consisting of mountains, nearly surrounded by a low plain of from 2 to 4 m. in width, extending from their base to the sea. The mountains are highest towards the N.E. part of the island, where their granite peaks rise to about 5,000 ft.; elsewhere they average nearly 2,000 ft. in height, and consist mostly of a compact cream-coloured primitive limestone. The island is not well-watered; but the E. is, in this respect, better than the W. portion. The climate does not appear to be particularly salubrious, though it be more temperate than in the adjacent continent. Among the few natural products, the most important is aloes (*Aloe spicata*, or *Socotrina*), for which the island has been famous from the earliest period. This plant is found growing spontaneously and in great abundance on the sides and summits of the limestone mountains, at an elevation from 500 to 3,000 ft. above the level of the plains. Its leaves are plucked at any period, and after being placed in a skin, the juice is suffered to exude from them. In this state they are mostly shipped for Muscat. Formerly the parts of the island producing the aloes were farmed out to different individuals, the produce being taken at a low fixed price by the Sultan. At present, any one collects the aloes leaves who chooses to take the trouble, and nothing is levied on the Sultan's account. The quantity exported of late has varied very much: in 1833, it amounted to 82 skins, or 2 tons; and the best sold for 1 rupee the Bengal seer (nearly 1 lb. English); while of the more indifferent, 4 seers might be procured for a dollar. (*Illustr.*) Dragon's blood is the article next in importance; it is the produce of a leguminous tree, the *Pterocarpus draco*, which grows on the mountains. Tamarinds, tobacco, and dates (important as food), are also grown. Agriculture is in an exceedingly low state; a species of millet being the only grain cultivated, and it is little used unless a failure of milk and dates be experienced. The animals are camels, sheep, goats, oxen, asses, and civet cats. Sheep and goats are kept in large flocks in every part of the island: they are generally of inferior kinds, while the cattle, on the contrary, though small, are very superior, and appear to be of the European variety. The trade is principally with Muscat, whence dates and other provisions are chiefly imported. According to Arrian, the inhabs. of this island were, in antiquity, subject "to the kings of the incense-country," or Southern Arabia. At present, Socotra belongs to the Sultan of Kisseen, but his supremacy is little more than nominal, the government being chiefly delegated to one of the principal inhabs., who again exercises little authority, except over the Bedouin, or native pop. The tribute to the Sultan barely amounts to 200 dollars a year. The population is wholly Mohammedan. The women go unveiled, and are partly occupied in tending flocks, and partly in making glue, and carding, spinning, and weaving wool.

The only town of any consequence is Tamarida, on the N.E. shore, in the centre of a bay which affords tolerable anchorage. Having been ruined by the Wahabees, in 1801, it consists of only about 150 straggling and dilapidated houses, not more than one third of which were inhabited in 1834. The town had then but two shops, where the only articles exposed for sale were dates, grain, tobacco, and cloths. (*Wellsted in Geog. Journal*, v. 129-229.)

**SOHAM**, a market-town and par. of England, co. Cambridge, hund. Staploe, near the borders of Suffolk, 6 m. S.E. Ely. Area of par., 13,420 acres. Pop., in 1831, 3,667. The town, which is irregularly built, covers a good deal of ground. The par. church is of various dates, one portion being late Norman. The living, a rectory, worth 530*l.* a year, is in the patronage of the present incumbent, who also holds the rectory of Soham. Par. worth 515*l.* a year. (*Eccles. Rev. Rep.*, 1831.) Soham has numerous charities, especially Bishop Lang's, for apprenticing children of the par., with an annual revenue of near 400*l.*; a large charity-school, and several almshouses. The fen or mere, which once covered the adjacent country, has been drained and cultivated, and supplies most part of the dairy produce, for which Soham is celebrated. Market-days, Saturday. Fair, May 7, for horses and cattle. (*Parl. Rep.*)

**SOISSONS** (an. *Noviodunum*, post. *Augusta Suessionensium*), a fortified town of France, dep. Aisne, cap. arrond.; on the Aisne, here crossed by a handsome

stone bridge, 17 m. S.W. Laon. Pop. in 1836, 7,864. Its fortifications consist merely of bastioned ramparts. It is well built, and clean, the houses being mostly of stone, roofed with slate. There are many curious and venerable public buildings; inc. the cathedral, founded in the 12th century, with an altar-piece by Rubens, representing the "Adoration of the Shepherds;" the remains of an abbey founded in the 11th century; the castle, on the site of that which was the residence of various Merovingian kings &c. The college, hospital, house of correction, public library with 18,000 vols., and theatre, deserve notice; and in the vicinity are the ruins of St. Medard's Abbey, founded in 557, in which Depin, Carlioman, &c. were crowned, and Louis-le-Debonnaire was confined by his sons. Soissons is a bishop's see, and has a court of primary jurisdiction, a communal college, two seminaries, a society of arts and sciences, manufactures of coarse woollens, hosiery, and earthenware, and a considerable trade in agricultural produce.

Soissons has been the theatre of various historical events. It was here, in 466, that Clovis finally distinguished the last remains of the Western Empire, by his victory over the Roman general Syagrius. The town then became the cap. of the Franks, and afterwards of a kind of its own name in the 6th and 7th centuries. It was frequently besieged and taken in the middle ages, and was the scene of some severe fighting between the French and the allies in 1814. (*Hugo, art. Aisne; Dict. G<sup>eo</sup>g.*, &c.)

**SOLOTHURN** (French *Soleure*), a canton of Switzerland, in the N.W. part of the Confederation, between lat.  $47^{\circ}$  and  $47^{\circ} 30'$ , and the 7th and 8th degs. of E. long.; having N. Basle, E. and S.E. Aargau and Lucerne, and on its other sides the cantons of Berne. Area 255 sq. m. Pop., in 1837, 63,196, mostly all R. Catholics. Though of a very irregular shape, it may be divided into two nearly equal portions; the N.W. covered with ranges of the Jura Mountains, and the S.E. comprised in the valleys of the Aar and Emmen. Some of the summits in the former rise to about 1,000 ft. above the level of the sea; but though rugged, this part of the canton has a large extent of fine upland pastures. In the other, or lower portion of the canton, the ground is fertile and well cultivated; so that, on the whole, Solothurn is regarded as one of the most productive portions of Switzerland. More corn is grown than is required for the consumption of the inhabs.; the vine does not succeed, but a good deal of fruit is notwithstanding grown for exportation. The rearing of live stock is here, however, as in most other Swiss cantons, the chief branch of rural industry. In 1838, it was estimated to have about 28,000 horned cattle, 14,000 sheep, and 16,400 hogs; the latter are fed in the woods, which are tolerably extensive. The cattle are esteemed among the best in Switzerland; they are of a peculiar large-tailed breed, and with horses, cheese, cherry brandy, fire-wood, and charcoal, constitute the principal articles of export. Only a few hands are employed in mining; and the manufacturing establishments are mostly confined to a few iron works, stocking and cotton looms, paper mills, tanneries, and printing houses. The currency, weights, and many usages of this canton, are similar to those of Berne.

Under the Constitution, as modified in 1831, the greater council consists of 119 mems., 96 of whom are chosen by the towns and the 10 rural districts into which Solothurn is divided, and the remaining 13 by the mems. already elected. The lesser or executive council, composed of 17 mems., is chosen with its president, or *avoyer*, from among the greater council. The assembly meets twice a year for 15 days, during which period each mem. receives 3 fr. a day. The town of Solothurn, and each of the districts has a court of primary jurisdiction for civil causes; but all criminal cases, as well as the final jurisdiction in civil suits, belong to a central tribunal of 14 mems. presided over by the *avoyer* of the state assembly. Every male inhab. above the age of 16 is liable to military service: the contingent to the army of the confederacy is 600 men. Total public revenue in 1835, 408,184 fr.; expenditure, 400,599 fr., of which 18,000 fr. was contributed to the general Swiss treasury. There is no town worthy of notice, except the cap., Olten, Dornec, &c. being mere villages.

**SOLOTHURN**, or **SOLEURE** (an. *Solodurum*), a town of Switzerland, and the cap. of the above canton, on the Aar, near the foot of the Jura mountains, and 18 m. N. by R. Berne. Pop., in 1835, 4,254. The river divides it into two unequal parts, which communicate by two wooden bridges. It was surrounded, in the 17th century, by cumbersome fortifications, the removal of a part of which was ordered by the cantonal council in 1835. It is tolerably well built, and has several conspicuous public edifices, including, among others, the cathedral of St. Urs, one of the best churches in Switzerland, with several other churches and convents, a town hall, a square clock-tower in the market place, the arsenal, with an extensive and curious collection of armour, a museum, government house, with some good sculptures

hospital, house of correction, barracks, theatre, &c. It has, also, a gymnasium, a botanic garden, and a public library, said by Ebel to comprise 10,000 vols. On the whole, however, the town is dull, having few manufactures, and but little trade. The Polish patriot and general, Kosciusko, resided here during the last two years of his life, which terminated on the 16th of Oct., 1817. His remains were carried to the cathedral of Cracow, where they repose beside those of the famous John Sobieski. (*Strohmeier, Der Kanton Solothurn; Pictet, Statist. de la Suisse; Ebel.*)

**SOMERSET**, a maritime co. of England; having N. and N.W. the Bristol Channel, the Severn, and Gloucestershire, E. Wiltshire, S. Dorset and Devon, and W. the latter. Area, 1,052,800 acres, of which about 900,000 are supposed to be arable, meadow, and pasture. With, perhaps, the single exception of Yorkshire, there is no county in England that has a greater variety of surface and soil than Somerset. In some places, particularly in its W. and N.E. divisions, it is hilly, and even mountainous; in its middle part, between the rivers Ax and Parry, there are very extensive tracts of marsh land, which, in some places, are of extraordinary fertility: in other places again, there is an extensive moor, of which Exmoor, at the W. extremity of the co., is the principal. But, exclusive of these, the co. contains a large extent of land equally adapted for tillage and pasturage. The Vale of Taunton is one of the richest and most beautiful tracts in the kingdom. Tillage husbandry is neither extensively carried on, nor in the most approved manner. The land is not injured by overcropping, but it is not properly wrought, and is frequently foul, and out of order. Principal crops, wheat, oats, barley, and beans. In the southern and interior parts, the rotation is, 1. fallow, 2. wheat, 3. beans or seeds, 4. oats; in the E. part of the co. it is generally, 1. fallow, 2. wheat, 3. oats or barley, 4. seeds. Potatoes are pretty extensively grown; but turnips are not cultivated to any extent in any part of the co. Lime is frequently used on the arable land; and, with the exception of dung is the only manure that is employed. Drilling but little practised; beans mostly planted by the dibble. Labourers said to be indolent; and that they seem, when employed, as if they would rather stand still than exert themselves. (*Kennedy and Grainger, l. 308.*) A large proportion of the co. is in grass, the dairy and fattening systems being both extensively carried on. Cattle, principally of the Devonshire breed; but a great variety of other breeds are met with. The celebrated Cheddar cheese is so called from a village of that name on the W. side of the Mendip Hills; but it is now principally made in the marshes round Glastonbury. Bridgewater cheese is made from the marshes between that town and Cross. The stock of sheep in the co. is supposed to amount to about 500,000 head, partly long, and partly short-wooled; producing, in all, about 10,500 packs a year. Large quantities of excellent cider are made in various parts, but particularly in the vale of Taunton. The woods and woodlands are supposed in all to cover from 20,000 to 25,000 acres; and it is distinguished by the stately growth of its hedgerow timber. Property very variously divided; some large estates, but a good deal of land occupied by yeomen who farm their own estates. Farms of various sizes, but the majority small. Leases, when granted, are usually for 8 or 12 years; in many instances, however, farmers hold at will. Average rent of land, 25s. 9d. an acre, being, with the exception of Leicester and Middlesex, the highest in the kingdom. Mineral products numerous and valuable, consisting principally of coal, lead, calamine, fuller's earth, limestone, freestone, &c. Owing, however, to the lead mines having been nearly exhausted, or becoming more difficult to work, the produce of lead is now of no inconsiderable. The woollen manufacture used to be extensively carried on at Taunton; but it has given place to the silk trade, introduced in 1778, and at present prosecuted on a pretty large scale. The woollen manufacture is still, however, carried on at Frome, Shepton Mallet, Wellington, and some other places in the co.; but it has long been in a declining state. Gloves largely manufactured at Yeovil. Principal rivers, Lower Avon, Ax, Brue, Parret, and Exe. The Parret is navigable from Langport to its mouth. Taunton and Bridgewater are united by a canal; and there are canals in other parts of the co. Somersetshire is divided into 40 hundreds and 7 liberties, and contains 475 parishes. It returns 13 mems. To the H. of C.; viz., 4 for the co., 2 each for the cities of Bath and Wells, 2 each for the bors. of Bridgewater and Taunton, and 1 for Frome. Reg. electors for the co., in 1830-40, 18,743, of which 9,759 belonged to the E., and 9,024 to the W. division. In 1841, Somerset had 81,532 inhab. houses, and 436,062 inhab., of whom 229,421 were males, and 226,581 females. Sum. expenditure for the relief of the poor, in 1839-40, 156,056*l.* Annual value of real property, in 1815, 2,308,723*l.* Profits of trade and professions in ditto, 1,329,264*l.*

**SOMERTON**, a market-town and par. of England,

co. Somerset, on rising ground beside the Carey, 11 m. S.S.W. Wells. Area of par., 6,630 acres. Pop., in 1831, 1,786. The town consists of some small streets, with houses mostly of blue lias stone; and has a town-hall, in which petty sessions are held, and one of the co. gaols. The church, an ancient structure, has an eight-sided embattled tower, 63 ft. in height. The living, a vicarage, worth 28*l.* a year, is in the gift of the Earl of Chester. Somerton has a good free-school, and an almshouse for 8 poor women. Though supposed to have been a Roman station, there is no information respecting it till the Hephtharchy, when it was a considerable fortified town, and the residence of Ina and other kings of Wessex. Hence it abounds in Saxon antiquities, including parts of the ancient walls, a round tower, and the castle, in which John king of France was imprisoned subsequently to his capture at the battle of Poitiers.

**SOMME**, a dep. of France, reg. N., comprised mostly in the old prov. of Picardy, between lat. 49° 37' and 50° 20' N., and long. 1° 25' and 3° 10' E.; having N. Pas-de-Calais, E. Aisne, S. Oise, and W. Seine-Inferieure and the English Channel. Area, 614,287 hectares. Pop., in 1836, 345,924. Its general slope is towards the N.W., which direction is taken by its principal rivers, consisting of the Somme, which divides it into two nearly equal parts, the Authie, forming a part of the N. boundary, and the Bresle, bounding it on the S.W. The Somme rises at Fonsomme in Aisne, and runs generally N.W. to the English Channel, which it enters a little below St. Valery, nearly opposite Hastings, by an estuary from 3 to 4 m. wide, after a course of about 120 m. Its principal affluents are the Avre and Celle; St. Quentin, Ham, Peronne, Amiens, and Abbeville are on its banks. The Somme is navigable for about half its course, but its navigation is interrupted by shoals. The lateral canal of the Somme (*Canal de Picardie*), 96 m. in length, commences at Abbeville, and connects this river with the Oise. This dep. has a generally a naked aspect. In 1821, according to the *Tableau de l'Etat*, it comprised 475,362 hect. arable land, 15,432 do. meadows, 20,500 do. orchards, &c. and 51,307 do. woods. Agriculture is more advanced than in most French deps.; *le cultivateur est laborieux et dégoûté de préjugés*. (Hugo.) More corn is grown than is required for home consumption; in 1835, its produce was estimated at nearly 5,758,000 hectol., principally wheat, maizine, and oats. About 200,000 hectol. of cider, and 100,000 do. of beer, are produced annually. Cattle and sheep are numerous, and the produce in wool is stated to be about 780,000 kilog. a year. In 1830, of 248,927 properties subject to the *coulrib. foncier*, 123,715 were assessed at less than 5 fr. Mineral products are of little importance; but the dep. is distinguished for its manufactures. Woollen, cotton, and silk goods of various kinds, are made at Amiens, Abbeville, cotton and linen thread, oil, and leather at Peronne, Ham, Doullens, &c. Escarbotin is the seat of some of the largest hardware factories in the kingdom; and machinery, paper, and beet-root sugar, are produced in considerable quantities. Somme is divided into five arronds: chief towns, Amiens the cap., Abbeville, Doullens, Montdidier and Peronne. It sends 7 mems. to the Ch. of Deps. Registered electors, 1838-39, 3,571. Total public revenue, 1831, 16,184,848 fr. (Hugo, art. *Somme; French Official Tables.*)

**SOOLOO ISLANDS**, a group of the E. Archipelago, 4th division (*Crawford*), extending from the N.E. part of Borneo to Mindanao, the most S. of the Philippine Islands, between the 4th and 7th degs. of N. lat., and the 120th and 123d of E. long.; having S. the Sea of Celebes, and N. the Sooloo Sea. They consist of about 60 islands, taking their name from Sooloo, one of the largest, about the middle of the group. They produce rice, sweet potatoes, yams, and many of the best fruits of the East; but sago is the principal food of the inhabs. Pearls, mother-of-pearl, and cowries, are among their most valuable products. Formerly the inhabs. carried on a large trade with Japan; at present their commerce is chiefly with the adjacent islands of Celebes, Mindanao, Borneo, &c., and a few junks that come yearly from China. The Sooloos are mostly Mohammedans, and live under a sultan, whose power is, however, much limited by a kind of feudal aristocracy. They are distinguished for their piracies, and their continual hostility to the Spaniards of the Philippines; in 1775 they destroyed an establishment formed by the E. I. Comp. on the neighbouring island of Balabagan. (*Hamilton, E. I. Gaz.*)

**SOPHIA**, or **TRADITZA**, a city of European Turkey, prov. Bulgaria, near its W. extremity, in a fine plain, on the Bogaia, a tributary of the Iskudar m. S.S.E. of the B. of 88. W. Rustchuk. Horsechebanu (*Sten*), dia, and 155 m. S.W. Rustchuk. Its pop. as high as from 45,000 to 50,000; and it is said to have 30 mosques, and 10 churches. Mr. Burgess says, "Sophia, although one of the meanest cities I ever saw, must still be considered as the cap. of Bulgaria, and as holding a high rank among the cities of European Turkey. The situation appeared to me the most unfavourable that

could have been chosen for a city; sunk in a hollow, it is constantly liable to be inundated; and without canals to carry off the superabundant waters of the Isker, the plain is almost lost to the labour of the agriculturist. The habitations are all made of baked mud; and I scarcely saw one which ought to be qualified with any other appellation than that of hovel." (*Greece, &c.*, ii. 469.)

Sophia is, however, the residence of the begler-beg of Roumelia, and of Greek and Rom. Cath. archbishops. It has manufactures of woollen and silk stuffs, leather, and tobacco, and an extensive general trade. There are some warm baths. This city, founded by Justinian, was built, it is said, on the ruins of the anc. Sardica. (*Burgess's Greece, and the Levant*, ii.; *Diet. Glog.*, &c.)

SORA, a city of the Neapolitan dom., Terra di Lavoro, cap. distr., on the Liris, 50 m. N.N.W. Capua. Pop. 10,000. (*Rampoldi*.) "The episcopal town of Sora, retaining its ancient name and situation, is about 3 m. distant from Isola, along an excellent road, which terminates with the valley itself at its gates. Here the Liris, flowing from a glen of narrower dimensions, but considerable length, forms a head round the city, and is crossed by two bridges. The place is consequently in a flat but not unpleasant position; one whole flank being watered by the river, and the hinder extremity resting against an insulated rocky hill, on which are seen the ruins of its Gothic castle, and those of its still more ancient walls. The dwellings are large, the streets wide and well paved, and the pop. apparently easy and industrious." (*Crauchen's Excursion in the Abruzzi*, &c. i. 119.)

After its cathedral, in the front of which are a number of inscriptions and fragments of sculptures, the principal buildings are four other churches, several convents, hospitals, and seminaries, a showy modern gateway, &c. The adjacent country is both fertile and well cultivated.

Sora was of Volscian origin, but became, at an early period, attached to the party of the Samnites; though subdued and colonised by the Romans, it repeatedly threw off their yoke, and vindicated its ancient freedom. Juvenal enumerates Sora among the country towns in which an individual, tired of the bustle and dissipation of Rome, might find a comfortable residence:—

Si potes avelli Circensibus, optima Sorae  
Aut Fabratric domus, aut Frustrone paratur.  
Sat. iii. 225.

Sora was the birth-place of the Cardinal Baronius. SORIA (an. *Numantria*), a city of Spain, in Old Castile, cap. prov. of its own name, on, and at no great distance from, the source of the Douro, here crossed by a line stone bridge, 13 m. N.E. Madrid. Pop. about 5,500. It is enclosed by old walls, and has numerous churches and convents, an hospital, Jesuits' college, prison, &c. On the E. it is commanded by an old fortress, now partly in ruins; and on the S. is a considerable suburb. It is dirty and ill-built, with a few silk fabrics, and some trade in wool.

Adjacent to the town, on the N., are the ruins of the famous city of NUMANTIA, destroyed by the Romans, anno 132 n. c. No people ever discovered greater bravery, or made a more gallant stand in defence of their liberties, than the inhabs. of this small state. *Numantia, quantum Carthaginis, Capuae, Corinthi, opibus inferior, ut virtutis nomine et honore par omnibus, summumque, si viros aestimes, Hispanie decus.* (*Florus*, lib. ii. cap. 18.)

The conduct of the Romans in this contest was distinguished alike by perfidy and vindictive malignity. The Numantines having defeated Pompey, grandfather of Pompey the Great, who had besieged their city, he concluded a treaty with them. But the Romans having, on various pretexts, broken this treaty, sent a powerful army against the Numantines under the consul Manlius. The latter, however, being even more unsuccessful than Pompey, was obliged, to save himself and his army from total destruction, to conclude a new treaty with his successful adversaries; who stipulated for nothing but that they should retain their independence, and be reckoned among the friends and allies of Rome.

Tiberius Gracchus, then questor in the consular army, was a principal party to this treaty, the observance of which was sworn to by all the chief officers of the Roman army. But though the Numantines spared by this treaty the lives of 10,000 Roman soldiers that were in their power, and stipulated for nothing that a generous or high-minded people could, under any circumstances, have refused to concede, the senate and people of Rome were base enough to annul the treaty; and sent Scipio Africanus, who had destroyed Carthage, to wage a war of extermination against the Numantines! Scipio, who knew the bravery of those he had to contend with, did not attempt to carry the city by storm; but having surrounded it by strong lines of circumvallation, left famine to effect its reduction. Notwithstanding their inferior numbers, the Numantines made the most astonishing efforts to break through and destroy the works of

the Romans; but having been repulsed, they were reduced to the most dreadful extremities. It is uncertain how the final catastrophe of this noble city was consummated; whether, as Florus affirms (lib. ii. cap. 18.), the Numantines set it on fire, and perished in the flames; or whether, as Applan states (*In Iber.* p. 311.), having surrendered, the small remnant of its inhabs. that were found alive were sold as slaves. One thing only is certain, that the struggle reflects the highest credit upon the Numantines, and the most indelible disgrace on the Romans. It is due to the character of Tiberius Gracchus to state, that he repopulated in the strongest manner the perfidy and bad faith of his countrymen in refusing to ratify the treaty with the Numantines. (Besides the authorities already referred to, see *Ancient Universal History*, xli. 400., 8vo. ed.)

SORRENTO (an. *Surrentum*), a city and sea-port of the Neapolitan dom., prov. Naples, on the S. side of the Bay of Naples, 18 m. S.E. that capital. Pop. about 8,000. (*Rampoldi*.) It is well built and clean; and has been celebrated in antiquity, as well as in modern times, for the beauty of its situation, and the mildness of its climate, being hence called by Horace *Surrentum Amicum*. (Epist. ii. l. 52.) It is the seat of an archbishopric; and besides the cathedral, has several churches, numerous convents, an hospital, seminary, college, school of navigation, and some silk manufactures. It was supposed in antiquity to have been the seat of the Sirens. (*Plin.* lib. iv. cap. 5.) But it derives its principal illustration from its having been the birth-place of Torquato Tasso, the greatest of Italian, and, perhaps, of modern poets, born here on the 11th of March, 1541. "Among the many respectable houses termed palaces, which adorn Sorrento, that in which the author of the *Gerusalemme Liberata* was born, naturally excites the greatest interest; it is placed on the cliff rising immediately from the sea, and offers some pretensions to elegance of architecture, but probably from its outward form no remains of its ancient appearance. Sorrento is a place of high antiquity; and the various inscriptions, bas-reliefs, &c. found in it at different periods, are collected under an archway in the town, which thus forms a kind of open museum, accessible to every visitor. The ancient walls and towers can scarcely be referred to the Lombards, who erected this territory into a small indep. principality. Oil, milk, meat, and game, are all excellent in their different kinds at Sorrento; while its veal is, by some, reputed the best in Europe. The capital is supplied from it with many of these articles, by boats plying at regular times of the day." (*Crauchen*, 391—396.) The beautiful Bay of Sorrento, 3 m. wide, is surrounded by a semi-circular range of wooded hills, between which and the sea is a rich plain, the *Piano di Sorrento*, in which are many villages and detached houses.

It was on the hills bounding the plain (*Colles Surrentini vitiferi*), that the famous wine was produced, which, in antiquity, was traded with the Falerian and Cereban.

Surrentina libes? nec Murdhina picta, nec aurum  
Summe; dabunt calices hae tibi vinas uos.

*Mart. Epig.*, lib. xiii. 110.

It was a powerful wine, and did not arrive at perfection till it had been kept about 20 years. Owing to the want of care, the wine now produced from Surrentine grapes is among the poorest in Italy. Near Sorrento are the remains of the villa of Pollus, described by Statius. (See *Steuernburg's Travels*, i. 88.)

SOUND. See *ELSINEUR*.

SOURABAYA, a considerable town of Java, being one of the three principal sea-ports of that island, on the N. coast of which it is situated, about 160 m. E. Samarang. It stands about  $\frac{1}{2}$  m. from the Strait of Madura, on the S. side, is said to be navigable by boats for 100 m. from the sea, and deep enough at its mouth to receive vessels of 250 tons. The town itself is of small extent, but it has several suburbs, and round it are a number of handsome villas; its vicinity, though low, being less unhealthy than that of Batavia. Mr. Earl says that it is also much more gay and lively than the latter, and well supplied with provisions of all kinds. Sourabaya seems to have the only secure harbour on the N. coast of Java, and the only one in which the shipping is well defended by the batteries on shore. Its chief entrance is commanded by a strong fort on a low island about 9 m. from the town. Several English residents, agents to the houses at Batavia, are settled here; though Europeans are upon the whole few. There are numerous Arabs and their descendants. According to Earl, more ships are built at Sourabaya than at any other port of the E. Archipelago: when he visited the place, in 1836, the great ship-builder was an Englishman, employing from 300 to 400 workmen, all of whom lived in a large village adjoining his dockyard. (*Earl's Eastern Seas*, 47. 73.: *Hamilton*, &c.)

SOUTHAMPTON, a parl. and mun. bor., sea-port, and market-town of England, being a co. of itself in Hampshire, at the embouchure of the Itchen, in an

Inlet of the sea, called Southampton-water, 12 m. S. by E. Winchester, and 70 m. W. S.W. London. Lat. 50° 53' 59" N., long. 1° 24' W. Pop. of the par. bor., which is co-extensive with the co. of the town, in 1831, 19,334; in 1841, 26,552. The approach to the town from the London road, through a fine avenue of trees and a well-built suburb, is exceedingly striking. The principal entrance is through Bargate, one of the ancient gates, which also divides the town into 2 parts called respectively Above-bar and Below-bar. The High-street below bar, which is more than  $\frac{1}{4}$  m. in length, leads directly to the quay, for the improvement of which the water-gate was removed about 40 years ago. The ancient part of the town was formerly enclosed with walls about  $\frac{1}{4}$  m. in circ., of which there are considerable remains on the W. side of the town, and two old gates in addition to Bargate. Many smaller streets branch both E. and W. from the principal avenue, and buildings are rapidly increasing, the space occupied by streets and houses now exceeding  $\frac{1}{4}$  m. in circuit. "The old town occupies nearly the whole of the par. of St. John, St. Lawrence, Holyrood, St. Michael, and All-Saints in par. The par. of St. Mary and All-Saints extra, extensive as it is, were till of late years principally agricultural. The town, however, now extends into both of them; and in the latter the new buildings consist principally either of handsome town-houses or detached villa residences. A new road has been formed, extending E. from the High-street to the steam-ferry over the Itchen; several new streets are already in progress, and docks are about to be formed on the river, near the ferry-pier. The par. of St. Lawrence and Holyrood, through which the High-street passes, contain the dwellings of the most respectable and opulent tradespeople: in the latter are the Market-place, Audit-house, Custom-house, several of the principal hotels, and the town quay; indeed, in a commercial point of view, these two par. comprise the most important part of the town." (*Mon. Record*, Report.) The whole town is well paved, lighted with gas, and is exceedingly clean: the inhabs. have hitherto been supplied with water from several springs in the neighbourhood, but from the increase of pop., and the deficiency of water of late years, the commissioners of water-works have entered into a contract for the construction of an Artesian well on Southampton Common, to supply 40,000 cubic feet per day, which is now (January, 1842,) nearly finished, the workmen having reached a depth of 552 ft., and entered the chalk stratum. The old reservoirs on the common will be supplied from this well in dry seasons. Besides the buildings devoted to commerce and other purposes, the town has a theatre and assembly-rooms. The military orphan asylum for girls, established by the late Duke of York, and occupying the dissolved barracks, has been removed, and the buildings are now appropriated to the establishment for the trigonometrical survey, recently removed thither from the Tower of London. The handsome suite of baths on the beach have been converted into a dock house and offices for the Southampton Dock Company; but there are very convenient baths in other parts of the town. The old Saxon castle, repaired by Richard II. in the view of protecting the harbour, was pulled down some years ago, and a private chapel, in which the Church of England service is performed, built upon its site.

The town has five par. churches, three of which are in the gift of the lord chancellor, one in that of the bishop of Winchester, and another in the patronage of Queen's College, Oxford. Holyrood church is an ancient edifice, with a tower and spire, the portico being the site, before the Reform Act, for the hustings at elections for the bor. St. Michael's is a large structure in the Norman style, with a handsome tower and spire between the nave and chancel. All-Saints is a Grecian building, with a turret, surrounded by six Corinthian pillars on a square pedestal. St. Mary's, also, is a modern structure, and its extensive burial-ground has hitherto served as a general cemetery for the town; but owing to its extremely crowded state, the requisite notices have been given, and an act will be applied for next session of parliament for the formation of a cemetery of 20 acres on Southampton Common. The Rom. Caths., Independents, Baptists, Wesleyan-Methodists, and Jews have each places of worship, and there is a Friends' meeting-house. There are 2 chapels, 1 proprietary, and 1 under trustees in connection with the establishment, and well-attended Sunday-schools, with several day-schools, supported wholly or in part by endowment. The grammar-school, founded by Edw. VI., has a small endowment: the premises have recently been rebuilt, and furnish accommodation for about 40 boys, boarding with the head master. An hospital, called the *Domus Dei*, founded in the reign of Henry III., provides lodging, clothing, and a weekly stipend to four aged people of each sex. Among other valuable charities, is one left, in 1760, by the will of Alderman Taunton, which, besides providing for the instruction of 10 boys, furnishes a stipend of 10*l.* a year for 16 aged persons, and gives rewards to deserving female servants. It has also

a female-penitentiary, public dispensary, and lying in charity, a royal humane society, several benefit societies, and a school of industry for 50 girls, founded, in 1828, through the influence of Queen Adelaide. There are several religious societies, a literary society, a polytechnic institution, with 400 members, an infirmary, and several news-rooms and subscription-libraries. A regatta takes place every summer on Southampton-water, under the direction and patronage of the Southampton Yacht Club, recently established, and races are held in autumn on the common N.W. the town. Two newspapers, also, are published every Saturday.

Southampton-water affords good anchorage; and ships of 250 tons may load and unload alongside the town quay, close to which is the custom-house. A new pier of wood and stone, which projects about 400 yards from the shore, forms a convenient landing-place for passengers from steamers, &c., as well as a promenade for the inhabs. and visitors. It has a carriage-drive to its extremity. Docks, on an extensive scale, are now (1842) in the course of being constructed, which will contribute materially to the commercial facilities now enjoyed by the port.

The Peninsular and Oriental Steam Navigation Company now run the whole of their vessels from this port to Alexandria and Lisbon; and, more recently, the Royal West India Mail-packet Company have started their steam ships from this port also, and have purchased a large tract of land on the banks of the Itchen for constructing repairing wharfs and a graving dock.

From its position on an inlet of the sea, stretching N.W. from between Portsmouth and the Isle of Wight, at least 17 m. into the country, and which has been prolonged by means of the Itchen to Winchester, 12 m. inland, Southampton is the emporium of an extensive district, and consequently enjoys a pretty extensive trade. In 1840, there belonged to the port 157 vessels, of the aggregate burden of 19,342 tons; and during the same year the gross customs' duties amounted to 77,943*l.* It may be further mentioned, as illustrative of the increasing importance of the port, that, in 1840, 355 ships, of the aggregate burden of 51,307 tons, entered inward, with cargoes from foreign parts; whereas, in 1811, no fewer than 555 ships, of the aggregate burden of 78,038 tons, entered inwards with foreign cargoes!

Owing, also, to her position with respect to the opposite coast of France, Southampton has been for a lengthened period an important station for travellers to and from the Continent. In this respect, however, her importance has been vastly increased since the opening of the South-Western Railway, by which the town has been brought within a three hours' journey of the metropolis. This great undertaking, in which above 2,000,000*l.* have been expended, has gone far to make Southampton an out-port, as it were, of London. In fact, she is now become the principal station of the steamers for Havre, Dieppe, and other French ports, as well as of those for Lisbon, the Mediterranean, &c. By setting off from Southampton, the difficult navigation from the N. Foreland and round by Dover and Beachy Head is avoided; and ships are enabled to proceed on their voyages with comparatively little chance of being delayed by adverse winds. Vast numbers of tourists are also brought down by the railway, attracted by the mildness of the climate, and the beauty of the scenery of the New Forest, the Isle of Wight (to which there are steamers every hour), &c. The completion of the railway, now in progress of construction, from Havre by Rouen to Paris, will confer still greater importance on Southampton.

Southampton has various private banking establishments, two joint-stock banks, and a savings' bank. Markets, Tuesday, Thursday, and Saturday, for provisions, and on Friday for corn, well attended. Fairs, May 6 and 7., and on Trinity Monday and Tuesday.

Southampton was first incorporated in the reign of Henry I. Under the Mun. Reform Act it is divided into 5 wards, with 10 aldermen and 30 councillors, from which 40 members are chosen, the mayor, sheriff, and 2 bailiffs. The mayor and bailiffs are the returning officers of the borough. Corp. revenues, in 1839, 5,059*l.* Quarter and petty sessions are held under a recorder; and there is a court for the recovery of debts to any amount. The bor. has returned two mems. to the H. of C. since the 23<sup>d</sup> July, 1., the right of election now being in the Reform Act being vested in the inhabs. paying scot and lot. The electoral limits were left unchanged by the Boundary Act. Reg. electors, in 1839-40, 1,463. It is also the election town for the S. div. of the co. Hants.

Southampton is said to have arisen out of the neighbouring Roman station *Caesantum*, E. the Itchen, which was succeeded by the Saxon *Hantune*, on the site of the present town. The castle, as already stated, was much enlarged by Richard II., who also strengthened the fortifications about the town and harbour. Henry V. set sail from this port, in August, 1415, at the head of the troops which, on the 25th of October following, gained the great victory of Agincourt. The inhabs. were actively engaged in the wars of York and Lancaster, in which

the latter party was defeated with great loss. Its celebrity as a watering-place dates from the middle of last century, when baths were erected, a chalybeate spring was discovered, and great additions were made by the formation of new streets and terraces, the laying-out of public gardens, &c. The shores of Southampton-water, being richly clothed with wood and studded with villas, afford a succession of finely diversified scenery, set off by the ruins of Netley Abbey, about 2 m. S.E. from the town. This structure was founded in 1229, by Henry III., for Cistercian monks. The refectory and kitchen are in tolerable preservation; and there are some fine remains of the Abbey church, which was cruciform, and had at its E. end a noble window. The whole is embosomed in wood; and near it is a modern tower, used as a tea-house, on the foundations of a fort erected by Henry VIII., commanding a fine view of Southampton-water. (*Mun. and Parl. Bound. Reports, and Private Information.*)

**SOUTH MOLTON** (or MOULTON), a munic. bor., market town, and par. of England, N.E. part co. Devon, hund. S. Molton, on an eminence near the confines of Exmoor, 12 m. E. by S. Barnstaple. Area of par., 6,160 acres. Pop. in 1831, upwards of 4,000. The limits of the munic. bor. and par. are co-extensive. The town consists chiefly of three streets, diverging from a spacious market-place. Many of the houses are good; streets well paved; the footpaths have been flagged, at a considerable expense, by the corporation. It is well lighted, and the streets and walks are kept remarkably clean. (*Mun. Corp. Rep. Appendix.*)

The par. church has some good monuments, and a large organ. The living, a perpetual curacy, worth 157*l.* a year, is in the gift of the dean and canons of Windsor. Here are free and charity schools; a guildhall, in which petty sessions are held every three weeks; and a gaol, rebuilt a few years since. The pop. is partly manufacturing, and partly agricultural: the manufactures are chiefly of coarse woollen cloth, but that of lace has been recently introduced, and the trade of the town is said to be increasing. This bor. sent mems. to the H. of C. in the 30th of Edw. I.; but it does not appear to have subsequently exercised the privilege. It was chartered by Elizabeth and Charles II., and is governed by a mayor, 3 other aldermen, and 12 councillors, the latter being elected for life among the resident inhabs. The corporation, which is trustee for several charities, has an income of 2,854*l.* a year, out of which the mayor receives an annual income of 50*l.* About 3 m. N.E. from the town is Castle Hill, the seat of Earl Fortescue. (*Mun. Corp. Rep. and Appendix.*)

**SOUTHWARK.** See LONDON.

**SOUTHWELL**, a market-town and par. of England, co. Nottingham, Southwell and Scrooby liberty, on an eminence near the Great, 13 m. N.E. Nottingham. Area of par., 4,550 acres. Pop. in 1831, 3,385. The town is neat, well built, and well paved. It has a convenient suite of assembly-rooms, a theatre, &c.; but its principal building is the minster, or parish church. This, which is a large and magnificent edifice, is said to be, in part at least, as old as the time of Harold. Its extreme length is 306 ft., its breadth 59 ft., and the length of the transept 121 ft. The W. front has 2 lofty square towers, divided into 7 stories. There is a low massive centre tower, and a chapter-house on the N. side. The nave and transepts are Norman, the parts E. of the centre early English, and the chapter-house early decorated. There are some perpendicular insertions, particularly a very large W. window. Within the church are the monuments of 5 archbishops of York. The chapter-house, which is light and graceful, has 16 prebends' stalls. "The early English portions, which consist of the choir, its aisles, and small E. transepts, form one of the best examples of this style in the kingdom. The whole of this church deserves the study due to a cathedral; and though it be not so varied in its styles as some edifices, it claims attention for its purity and good preservation." (*Rickman's Gothic Architecture*, p. 221.) The ruins of an ancient palace of the archbishops of York, the favourite summer retreat of Cardinal Wolsey, stand in the park, and a part is now appropriated as a sessions house for the liberty. The general bridewell for the county is at Southwell, which has also meeting-houses for Wesleyans and Baptists, and a free-school, with 2 scholars (at St. John's Coll., Cambridge. What little trade the town possesses is chiefly in malt, hops, and tan. The living of Southwell is a vicarage, worth 144*l.* a year, in the gift of the prebendary of Southwell. (*Ecc. Rev. Rep.*) Market-days, Saturday; fairs, Whit-Monday and Oct. 21.

**SOUTHWOLD**, a sea-port, munic. bor., market-town, and par. of England, hund. Blything, on an eminence on the E. coast of the co. Suffolk, about 1 m. N. from the mouth of the Blythe, 30 m. N.E. Ipswich, and 94 m. N.W. London. Pop. in 1831, 2,079. "It consists principally of a long row of houses commencing near the bridge over the Bass Creek, and extending S.W. to the edge of the cliff,

besides numerous other houses with gardens, lying N. and S. of the principal street. Near the sea there are several good houses, but the others are chiefly of an inferior description. The town is not lighted nor watched; but the footpaths have been partly flagged by subscription, and the inhabs. are well supplied with water from several excellent springs." The guildhall is a handsome stone building, and a new gaol was built in 1819. On the cliffs are two batteries, one of which has a parapet and 6 eighteen-pounders, but the other has only 2 guns. The church, built in the middle of the 15th century, is a fine edifice in the later English style, with a lofty tower and steeple of freestone intermingled with flint of various colours. The S. porch is extremely elegant; and above the clerestory roof is a light, open lantern. The interior is richly ornamented with piddling and carved work; and on the whole this is one of the finest churches in the co. The Independents, Baptists, and Wesleyan Methodists have each places of worship; the town, also, has 3 Sunday-schools and a national school. "The retail trade of Southwold is trifling; but a somewhat more important traffic is carried on in the importation of coal and the exportation of salt (which is made here), red herrings, and malt. The principal business, however, is connected with the influx of visitors, who resort to the town as a watering-place during the summer season," and for whose accommodation there are baths, reading-rooms, a grand promenade, &c. (*Mun. Bound. Rep.*) The entrance to the haven is by the river, and vessels trading to foreign lands their goods at Black-shere quay, about 3 m. S.S.W. the town. The harbour of Southwold is vested in commissioners; and it has been much improved by the erection of 2 piers at the mouth of the river, which has been made navigable to Halesworth, 8 m. W. by N. the town. The bor. of Southwold, which was incorporated in the reign of Henry VII., is governed under the Mun. Reform Act by a mayor and 3 aldermen, with 12 councillors. A court of record is established for the recovery of small debts, and there is a court of admiralty for the regulation of the port, which is subordinate to that of Yarmouth. Markets on Thursday: fairs, Trinity-Monday, and Aug. 24.

Southwold, or Sole Bay, E. of the town, is celebrated as the scene of the great naval engagement which took place on the 28th of May, 1672, between the combined English and French fleets under the Duke of York (afterwards James II.) and Marshal d'Etrees and a Dutch fleet under the famous De Ruyter. The action was most obstinately contested; the loss on both sides being very great and nearly equal. The Earl of Sandwich, who behaved with the greatest gallantry, was blown up along with his ship. The French suffered but little, in consequence, as is supposed, of their having received secret instructions to spare their ships. (*Home, cap. 65.*)

**SPA**, a town and watering-place of Belgium, prov. Liege, on the borders of Rheinish Prussia, 14 m. S.E. Liege, and 10 m. N. of the city of Namur. It is a cluster of houses thrown into the form of two or three irregular streets and open promenades, the whole embosomed amidst trees and gardens, and overlooking on the N. and E. by a woody mountain range." (*Chambers's Tour on the Continent.*) It was at one period a place of great resort, and so highly distinguished for its mineral waters, that "Spa" became a common name for mineral springs and bathing places wherever found. One of its greatest patrons was Peter the Great of Russia, who frequently visited it, and built the pump-room over the main spring, the only edifice in the place having any architectural pretensions. It is now, however, greatly fallen off. The tide of fashion has set in favour of Carlsbad and Wiesbaden; and it is not supposed to have more than about 3,000 resident inhabs. The *Pouhon*, or main spring, is a strong and active chalybeate, impregnated with carbonic acid gas, which gives it vivacity, and fits it for being preserved and sent in bottles to all parts of the world. There are several similar springs at from 2 to 3 m. from the town, at all of which there are pump-rooms, and to some baths are attached. Spa has two libraries with well supplied reading-rooms, a theatre, card-rooms, &c., a large par. church, and a Capuchin convent; and during the season an English church is opened. The hotels and lodging-houses are very respectable, and are abundantly supplied with provisions. A manufacture of painted wooden boxes, &c., carried on in the town, employs a good many hands. (*Chambers's Tour on the Continent, Murray's Handb.; Tennant's Belgium, &c.*)

**SPAIN** (an. *Hispania*, Span. *España*, Fr. *Espagne*), an extensive and once powerful kingdom of S. Europe, occupying the E. and largest portion of its S.W. peninsula; between lat. 36° 5' and 43° 30' N., and long. 3° 20' E., and 9° 10' W.; having N.E. France, from which it is separated by the Pyrenees; N. the Bay of Biscay; W. Portugal and the Atlantic; and S. and E. the Straits of Gibraltar and the Mediterranean. Greatest length, E. to W. about 650 m.; greatest breadth, 550 m. The names, area, and pop. of its an. and mod. subdivisions have been stated as follows:—

The shape of Spain resembles that of a very irregular pentagon, the longest side of which faces the N. The coast line is, on the whole, pretty regular, without those great and sudden indentations that characterise the shores of many other countries, though an exception may be made as regards the coast of Galicia, which is fringed with bays and headlands, the principal among the former being the Bays of Betanzos, Pontevedra, and Vigo; and among the latter the Capes Estaca, Ortegal, and Finisterre. The other capes of Spain are principally on the coast of the Mediterranean. C. Tarifa abuts on the Strait of Gibraltar; and further N. are Capes Gata, Palos, La Nao, and Creux, the last being the extreme E. point of the peninsula. The surface is very much diversified, and intersected with mountains; but the whole may be described as a table land of considerable elevation, Madrid, the cap., being 2,173 ft. above the sea, which is the average height of the towns in the interior. Five chains of mountains, are pretty clearly defined, running from E. to W. through the peninsula. 1. The range of the PYRENEES (which see) not only divides France from Spain, but runs in a continuous chain parallel to, and at a short distance

from, the N. shore upwards of 600 m. as far W. as C. Finisterre. The E. division is known as the Pyrenees properly so called, the W. portion consisting of the Asturian mountains: the highest point in the former is the Pic de Netore on Mount Maladetta (11,424 ft.), and in the latter the Peña de Peñaranda, S.W. of Oviedo (11,031). 2. A range extends W.S.W. from the Ebro, near Tudela, dividing Old and New Castile, Leon and Estremadura, and thence running S.S.W., through Portugal, to Cape Roca, near Lisbon: the culminating point is the Sierra de Grados (10,552 ft.), at the S.W. angle of Old Castile; but the average height does not exceed 4,500 ft. 3. A chain branching S.W. from that last mentioned divides the basin of the Tagus from that of the Guadiana: the central portion, S. of Toledo, called the Sierra de Guadalupe, attains a height of 5,110. 4. A range, called the Sierra Morena, runs along the S. border of La Mancha, in New Castile, which, though not continuous and of no great extent, forms the watershed between the Guadiana and Guadalquivir. 5. The Sierra Nevada runs from C. Palos, near Carthagena, almost as far as Cadiz: it is at no great distance from the Mediterranean, the most elevated part being S.E. of Granada, where the Cerro de Mulahacen rises 11,660 ft. above the sea: the peak of Veleta is 11,385 ft. in height; and further W. the Serrania de Ronda attains an elevation of 6,011 ft., while the neighbouring town of Ronda is about 3,300 ft. above the sea. (See Essay on the Phys. Geog. of Spain, in *Labore, Itinéraire d'Espagne*, vol. v. last ed.; *Bruguière, Géographie de l'Espagne*; *Berghaus, Erdbeschreibung*, pp. 316-318; *Antillon*, p. 221-270. The altitudes are given exclusively from Bruguière.)

The mountain-chains now described regulate the course of the principal rivers, some of which are of great extent, and have numerous tributaries. Immediately S. of the Pyrenees is the Ebro, which, rising on the Asturian ridge, near Reymosa, runs S.E. through a succession of narrow valleys, receiving its chief tributaries from the S. face of the Pyrenees, and flows into the Mediterranean about 26 m. below Tortosa: its entire length somewhat exceeds 400 m., and the area of its basin is estimated by Berghaus (*Erdbeschreibung*, p. 237.) at 25,800 sq. m. Among the other rivers flowing into the Mediterranean are the Guadalquivir and Júcar, falling into the Bay of Valencia, and the Segura in Murcia: the rest are unimportant. Five large rivers run westward into the Atlantic Ocean. The most N. of these is the Minho, which rises in the Asturian mountains, and running first S. and then S.W., enters the sea a little below Caminha, after a course, including its windings, of about 150 m. The Douro rises in the mountains of Old Castile, a few miles N. of Soria, and takes a generally W. course, by Aranda, Tordesillas, and Zamora, as far as Miranda, where, turning southward, it forms a portion of the boundary of Portugal, through which it flows westward into the sea close to Oporto: its length is estimated at 500 m., and the country drained by itself and tributaries somewhat exceeds 34,000 sq. m. The Tagus has its source in the Sierra de Albarracin, in Aragon, whence it flows W.S.W. by Aranjuez, Toledo, Talavera, and Alcantara, to the confines of Portugal: it then turns S.S.W., and, after expanding into a fine estuary, enters the Atlantic, a little below Lisbon, built on its N. bank. The Tagus has numerous important tributaries, the chief of which are the Henares, Alberche, Alagon, and Zatas, the last being in Portugal: the extent of its basin is estimated at 29,000 sq. m. The Guadiana, rising in La Mancha, runs first N.W., then W. as far as Badajoz, where it curves southward, and enters the sea at Ayamonte, after a course of 420 m.: it has several pretty large tributaries, and drains an area of about 25,600 sq. m. The Guadalquivir, which, with its tributaries, drains a large portion of Andalusia, rises in the Sierra de Alcaraz, and taking a S.W. direction by Andujar, Villafraña, Cordova, and Seville, turns southward, and after crossing a low, unhealthy swamp, enters the Atlantic at Sanlúcar, after a course of 320 m.: its largest affluent is the Genil, and the area of the entire basin is nearly 18,000 sq. m. But, with the exception of those portions of the Douro and Tagus within the limits of Portugal, these rivers, notwithstanding their length, offer few advantages for navigation, owing to the rocks, shallows, and falls with which they are encumbered.

The Ebro has, however, been made navigable to a considerable extent by means of the Canal of Aragon; and the channel of the Tagus is also in course of being improved, so as to make it accessible for boats as far as Aranjuez. Vessels of 100 tons ascend the Guadalquivir, within about 8 m. of Seville. The rivers on the N. side of Spain are comparatively insignificant, owing to the closeness of the Asturian mountains to the sea: one of these, the Hidasso, forms the dividing line between France and Spain. There are no lakes of any considerable size, though in the Pyrenees and other chains there are several small mountain-lakes. Swamps and morasses,

however, are both numerous and extensive; the principal being the Galloacene, in Aragon; the Nave, near Palencia, and the Lagunas de Palomares and Caldera.

A central band of granite and mica-schist stretches along the Pyrenees from the Mediterranean near the Bay of Biscay, flanked successively by beds of secondary and cretaceous formations: the primary rocks, however, are by no means so extensive as in the Alps, and do not extend westward beyond the Bidassoa, all the mountains of Asturias and Galicia being of the sandstone and carboniferous limestone that form the lower parts of the main chain. The lofty range that divides the two Castiles, and forms the watershed between the Douro and Tago, consists chiefly of granite and other primary rocks, which pass eastward under the sandstone, forming the lofty uplands of Sorio, in Old Castile; it is flanked on both sides by sandstone and limestone; but in New Castile are extensive beds composed of the *débris* of primitive rocks associated with marls and gypsum, the marly subsoil being remarkable for the fertility of the surface, whereas the gypseous districts are remarkable for their barrenness and dismal appearance, such as is exhibited in the neighbourhood of Madrid. The Sierra Morena also exhibits a large proportion of primary rocks, partly covered by secondary and other rocks, with the nature of which we are but little acquainted. The Sierra Nevada is a mass of mica-slate and serpentine, flanked northward by secondary and more recent rocks, containing some of the richest marbles of Spain, many of which adorn the churches of Granada and Seville: the S. side, forming the deep valleys of the Alpujarras, is principally of secondary limestone resting on slate (highly metalliferous), greenstone, and blue limestone. The limestone strata of the Sierra de Gador are remarkable for lead mines, which are extremely rich, and sufficient to supply the whole of Europe with this mineral for many centuries to come. With respect, indeed, to the mineral wealth of Spain, there can be little doubt that it is very great, and by no means exhausted by the workings of the ancients. There are valuable copper-mines in the Sierra Morena and the Alpujarras, and near Teruel in Aragon. Quicksilver is found at Almaden, on the N. side of the Sierra Morena, and graphite occurs near Marbella, in the neighbourhood of Malaga. Graphite is found, also, in the high Pyrenees, scarcely inferior to that of Cumberland, but wholly unwrought. Sulphur occurs in several parts of Valencia, and saltpetre, alum, and salt are found in many parts of the country. Iron and coal abound in the mountains of Biscay and Asturias, and are wrought to a considerable extent; besides which there are extensive iron mines, with smelting-houses, &c., at Marbella, near Malaga, and in the Sierra Morena, near Pedrosó. Coal occurs, also, in large seams throughout Aragon and Catalonia, as well as on the Guadalquivir near Seville; and traces of the same mineral have been discovered near Malaga.

"The soil of the Peninsula exhibits great diversities. The central region consists for the most part of arid, unsheltered plains either of sand or gypsum, intersected with lofty mountains, which reflect with intolerable fierceness the scorching heat of summer, and sharpen to more intense keenness the rigorous cold of winter. The lower region of the coast, sloping gradually towards the sea, is broken into an alternation of mountains and valleys, producing the most agreeable variety, and presenting a pleasant contrast to the bleak and barren sameness which characterises the central region. It is every where fertile, or may be rendered so by irrigation." (*Foreign Quarterly Review*, No. IX. p. 152, written by the author of this article.) The alluvial soil of Old Castile is tolerably productive, even without irrigation: New Castile has every variety, from the gypseous marl composing the poor soil about Madrid, to the red marl of Guadalaxara and the limestone of Arganda. The valleys of the Sierra Morena, and the whole of Estremadura, have a soil formed of detritus from primary rocks, and cannot be excelled in beauty and natural fertility. The soil of Andalusia is chiefly of marl and clay interspersed with red sandstone marls, and it is by irrigation only that it can be made productive. The Vega of Malaga, however, is naturally of surprising fertility, owing partly to the long establishment of irrigation, but partly, also, to the fact of its being in a great measure alluvial. Valencia has a poor ungrateful soil, yielding crops only by forced cultivation, and the use of water. In Catalonia and Aragon the detritus of limestone is found alternating with fine red marls and waste tracts of gypseous marls, similar to those near Madrid. "On the whole, the valleys of the Sierra Morena and the Alcarria, the provinces of Toledo and Guadalaxara, the Vega of Malaga, and the country between Gibraltar and Cadiz, would probably repay the labours of agriculture better than other parts of Spain." (*Cook's Sketches in Spain*, ii. 330, 335, in which are many valuable remarks on its geology and internal economy.)

VOL. II.

The climate of Spain is greatly diversified, being modified by the physical conformation of the country. The temperature of the air always varying less near the coast than in the interior, is much more equable in the maritime than the other provs. On the N. and W. coast westerly winds prevail; and, being loaded with moisture from the Atlantic, discharge abundant rains in winter and spring. The coast of the Mediterranean has a calmer atmosphere, with a prevalence of E. winds, and a temperature generally rising above 57° Fahr., and seldom descending so low as 32°. Winter, indeed, is almost unknown on a coast sheltered by the elevated land of the interior, and warmed by the rays of a cloudless sun; while the heat of summer is very great, and would be all but intolerable, were it not lessened by the sea breeze, which lasts during the greater part of the day. On the plateau of Castile, the mean height of which, according to Bruguère, is about 1,960 ft. above the sea, heat accumulates much more slowly, and it is only during the month of July that the temperature ascends as high as 77° Fahr. In August, the mornings and evenings begin to be cold; and in winter the severity of its climate forms a very striking contrast with the heats of summer. Except in the N. provs., the climate of Spain is every where remarkable for dryness; a freedom from rain, and a cloudless sky being advantages that may generally be counted on; but this dryness occasionally becomes so excessive that the rivers are dried up, vegetation destroyed, and men and animals die miserably of thirst. (*For. Quart. R.*, ix. 153.) Two kinds of winds are very troublesome in Spain. The *gallego*, a N. and N.W. wind, which comes down from Galicia, is very cold and piercing; causing, besides other diseases, painful affections of the eyes, often ending in blindness, which is very common in all the more elevated districts. This ophthalmia, however, is attributed by some writers to the vast quantities of minute nitrous particles blown up from the waste lands, and held in suspension by the wind. (*Faure, Souvenirs du Midi*, p. 5-8.) The S. provs. are visited by the *solano*, which, like the *scirocco* of Italy, relaxes the system, and produces giddiness, inflammation, and even death. Owing to its extreme and sudden variations, the climate of the central plateau is far from healthy. The Madrid cholera is always dangerous, and often fatal to strangers; besides which there is a general tendency to pulmonary consumption, and other diseases of the lungs. Scrofulous diseases are even more common than in Russia, and epilepsy is by no means rare. The yellow fever, which often ravages the S. provs., has excited much discussion among physicians, some of whom treat it as epidemic, while others are of opinion that it is brought to Spain by infection. Insanity prevails more or less in all parts, but especially in the provs. bordering on the Mediterranean. (*Faure*, pp. 69-84; and *For. Q. R.*, ix. 156-158.)

The mineral products of Spain are rich and various, and might certainly be made the source of vast wealth. By a curious coincidence Spain itself was to the ancient what its American possessions have been to the modern world, the principal source of the supply of the precious metals. It is exceedingly doubtful, however, notwithstanding the numerous statements to the contrary, whether the Carthaginians or Romans ever discovered any mines of gold and silver in Spain. The more probable opinion seems to be, that the gold was wholly obtained from washings; and that the silver, which was by far the more abundant and important product, was extracted from the lead, which was then raised, partly for the sake of the silver, in vast quantities. (*Antillon, Geografia*, 149.) The mine of Guadalcanal, which, according to Cook (ii. 73.), is the only one of silver that is now wrought, was, with that of Cazalla and others, discovered long after Spain had been evacuated by the Romans. (*Antillon*, loc. cit.)

The most valuable of the existing Spanish mines are those of lead in Granada; and the supplies obtained from them during the last 20 years have been so large that they have occasioned the abandonment of several less productive mines in other countries, and a considerable fall in the price of lead. The quicksilver mines of Almaden, in La Mancha, are also extremely productive, and supply, indeed, most part of the quicksilver imported into this country, and large quantities for the New World. Exclusive of innumerable salt springs, there are mines of rock salt at Miganilla, in La Mancha, and the mountain of Cardona, in Catalonia, 17 m. N.W. Monserrat is a vast and solid mass of pure rock salt! The iron trade will be afterwards referred to; copper, tin, antimony, and other minerals are found in various parts of the country, with every variety of marble, and the finest building stone. There can, indeed, be no doubt, that, under a government capable of developing the national resources, the mineral wealth of Spain would be found to be equal, if not superior, to that of most other countries.

*Agriculture and Animal Products.*—The wheat of Spain, though of very various qualities, is generally excellent, and its bread is said to be the best in Europe. In some dis-

Z z

tricts the quantity grown is insufficient for the consumption, the deficiency being made up from the surplus produce of other provs., or by importation, though, owing to the badness of the roads, and the consequent difficulty and cost of carriage, there is often a great difference in the prices of corn in markets at no great distance from each other. Wine is raised abundantly throughout the country; and the coast districts of Xeres, Rota, Malaga, Benicarlo, and Alicante, furnish large quantities for exportation. The wine of the interior, though seldom exported, in consequence of the bad roads and expense of transport, is sometimes of good quality; and that of Val de Pefias, in La Mancha, in particular, a dry red wine, has obtained a high reputation for its superior flavour and delicacy. Grapes are also exported, both in a fresh and dried state. Among the other productions of the soil are oats, barley, maize, rice, oil, sugar, hemp, flax, *esparta* or sedge, cotton, saffron, harilla, honey, and silk, with all the European vegetables, and some even of those of the warmer regions.

The fruits of the S. are lemons, bitter and sweet oranges, pomegranates, dates, olives, almonds, and pistachio nuts; apples, pears, cherries, peaches, and chestnuts are grown in the N. provs. Immense quantities of hazel nuts are exported from Catalonia, and the fruit of the carob-tree is used for feeding cattle. On the Pyrenees, Asturian mountains, the Sierra Morena, &c. are luxuriant forests; but, on the whole, Spain has less timber than any other extensive country of Europe; a circumstance owing, not to any inaptitude of the soil for the growth of forest trees, but to an inveterate and inexplicable prejudice of the people against trees, which are mercilessly cut down or destroyed before they attain any considerable size. Indeed, so universal is this propensity in the central provs., that the most rigorous measures are necessary to preserve the avenues of Aranjuez from wanton destruction; and all statutes for the encouragement of planting have signally failed of their object. (*Foreign Q. Review*, ix. 154, 155.) Spain has eight varieties of oaks; among which are the evergreen oak, or *Quercus ballota*, which has edible acorns, in taste resembling chestnuts; the cork oak (*Q. suber*), and the cochineal-oak (*Q. coccifera*), on which is found the false cochineal, yielding a fine crimson dye. The true *Quercus robur*, however, which furnishes the best materials for ship-building, scarcely exists, except in the N. provs. (*Cook's Sketches*, ii. 242-255.) Among the other forest trees may be enumerated tamarisks, pines, beeches, chestnut trees, nut trees, firs, poplars, and the *amanch* (*Rhus coriaria*), the bark of which is used for tanning.

Among the animal products of Spain, the horse is entitled to particular notice. The Arabs, when in possession of the country, stocked it with their finest breeds; and though the race has degenerated, it still shows many of the points by which it was originally distinguished. In beauty, grace, and docility, the horses of Andalusia are said to be superior to those of England; but it may be doubted whether they are equal to the same amount of labour. In fact, the number of good horses is rapidly decreasing in Spain, chiefly owing to the preference given to mules for domestic and agricultural purposes: the importation of horses to improve the breed, and the exportation of colts, are alike forbidden, and "the number of horses bred at present is quite inconsiderable, notwithstanding the decrees, premiums and encouragements of every kind that have been offered by government. The celebrated breed of the sovereigns of Spain at Cordova is nearly extinct; in the Serrania de Ronda (once the Cleveland of Spain) only miserable animals, called *serpanos*, are now reared; the wealthiest Andalusian nobles have only 2 or 3 in different saddle-horses, and there is scarcely a horse in the whole country fit for the draught of artillery." (*Cook*, ii. 59-61.) Great numbers of mules are bred in Old Castile, being sent to come to their full size in the rich pastures of Estremadura, whence they are supplied to the rest of Spain. The asses are very different animals from those seen in England, being of a large size, carefully bred, and in strength, docility, and sure-footedness, nearly equal to the mules. Cattle are small, and not of fine appearance. The bull of Andalusia is found wild in the Sierra Morena. Hogs are bred in vast numbers, and those which feed on acorns are celebrated for the delicacy of their meat, which is, perhaps, unequalled. Sheep, however, are the favourite stock of Spain, and are every where raised in considerable numbers (see *poet*); nor are there wanting wild animals, such as wolves, lyaxes, wild cats, wild boars, and foxes. The bear, which used to be common two centuries ago, is now found only in the Pyrenees. Monkeys are met with in the Sierra de Ronda, besides which there are various reptiles, as chameleons, lizards (some 2 ft. in length), vipers, and snakes. Among the birds may be noticed several species of vultures, falcons, owls, ravens, magpies, Cornish choughs, partridges, quails, bustards,

and plovers. (*Cook's Sketches*, i. 58-62., 254-287.; and *For. Q. Review*, ix. 156.)

*Agriculture*.—"No country in Europe," says Laborde "is so generally fertile as Spain, or has equal advantages at all seasons of the year. Spain, after its conquest by the Romans, became the granary of the Roman empire. Under the Gothic vast canals and sluices were formed for irrigating the land, and the amount of corn then raised was sufficient not only for the home supply, but also, to a considerable extent, for exportation. Agriculture under the Moors was in a still more flourishing state; for when they invaded the country, they carried with them their methods of husbandry, broke up the uncultivated lands augmented the number of plantations, carried the art of irrigation to a degree now scarcely attainable, introduced the culture of rice, and greatly improved the breed of horses: in fact, every kind of production was increased under their improving hands; and the era of their expulsion designates the epoch of the decline of agriculture. The Spaniards, thus deprived of the assistance of the Moors, were compelled to till the land themselves; but for such pursuits they possessed neither talent, nor industry, nor patient industry. Hence the whole system fell into a state of languor, from which it has, owing to several causes, never recovered." (*Laborde*, vol. iv.)

We have quoted this passage, because it states, in a few words, what has long been the popular opinion in regard to the ancient as compared with the modern state of Spain. We believe, however, that it is wholly erroneous. The fertility of the country has been greatly exaggerated; and we much doubt whether her agriculture was ever in so advanced a state as at this moment. A great portion of Spain is, owing to the heat of the climate and the want of water, wholly unfit for husbandry; and she has, in consequence of the frequency of droughts, been at all times subject to the most destructive famines. Owing to the numerous ridges of mountains by which she is intersected, her internal commerce has always laboured under the greatest difficulties; and there is no evidence that her artificial communications, that is, her roads, canals, bridges, &c. were at any former period in a more improved state than that in which we now find them. Owing to vicious institutions, bad government, and other causes, Spain has, for a lengthened period, continued stationary, or made but little progress, while other nations have advanced with giant steps in the career of improvement; but there is no real foundation for the prevalent notion of her having been comparatively well cultivated, rich, and industrious previously to the expulsion of the Moors, or in the reigns of Ferdinand and Isabella and Charles V. Capmany, in his *Quisiones Criticas* (cap. 13), has proved, beyond all controversy, that there were in the 13th and 16th centuries the same complaints of the wretched state of agriculture, of the idleness of the Spaniards, of their want of industry for industry and the useful arts, and their dependence on foreigners, that are still made against them. It is needless to say, that without tranquillity and good order there can be nothing like a flourishing agriculture. But at the very time that it is said to have been most flourishing, that is, previously to and during the reign of Ferdinand and Isabella, the Spanish historians represent the country as a prey to rapine, outrage, murder, and every sort of violence and disorder. Indeed, so early as the 13th century, the principal cities of Aragon and Castile had formed an association, called the *Santa Hermandad* (Holy Brotherhood), for their mutual protection against the robbers and plunderers with which the country was infested; and during the reign of Ferdinand and Isabella this institution was still further extended. (*Robertson's Charles V.*, vol. i. note 36.) And if these facts were not enough to demonstrate the entire worthlessness of the statements as to the flourishing state of agriculture in Spain previously to the expulsion of the Moors, the organisation of the laws respecting the  *mesta* (migratory flocks) would sufficiently evince the truth of what has now been advanced; for had the country not been at the time in a half-occupied semi-barbarous state, every one must see that the oppressive privileges conferred on the owners of the sheep never could have been carried into effect, or had any practical existence.

Having thus briefly disposed of the apocryphal statements as to the former flourishing state of agriculture in Spain, we have now to inquire into its present state, and the circumstances to which its long-continued depression are principally to be ascribed.

With the exception of a few districts which have peculiar facilities for irrigation, agriculture is in the most backward state imaginable. Great part of the land is not tilled, and that which is tilled is executed in so careless and slovenly a manner, as to produce a starved crop of corn in spots where they might command the most abundant harvests. The corn is usually choked up with stones, filth, and weeds of every kind. (*Clark's Letters*, p. 285.) Generally speaking, tillage farms are small, and rents low; but owing to the exorbitant taxes, and other expenses wholly exclusive of rent, the

farmers are wretchedly poor, and when they require money, are obliged to obtain it at exorbitant interest, by mortgaging their crops. The system of letting land is very various, money rent being taken in some parts, while in others the rent consists of a stipulated quantity of produce, and in others the *metayer* system prevails. Generally, however, large estates are not let out in farms, but are managed by agents, who, for the most part, are totally ignorant of the business of agriculture, and whose great object is to squeeze out of the land all that it can be made to produce by the most expeditious processes. Farm houses are rarely seen, except along the E. coast. The farmers live in huts of the meanest construction, crowded together in villages, so that farm buildings, often so expensive in other countries, cost almost nothing. Spring-corn is generally sown on the ground before it has been turned up, and is still covered with the winter weeds; and is then ploughed down, or rather scratched in with a miserable instrument, and left to nature. Owing to the dryness of the climate, this is a less ruinous system than might have been supposed, for when the heat sets in the corn ripens, while the weeds perish. When ripe the corn is gathered in the field, and after being thrashed or trampled out by mules and asses, is left in heaps on the ground till it be sold. The corn speculators of Castile preserve grain in *silos*, or subterranean caves, sometimes for 5 or 6 years, or till a market opens for it. Public granaries, or *positos*, are, also, established in most districts, where corn may be warehoused till it can be disposed of. The implements of husbandry are of the rudest description; it is not uncommon in the S. to see men returning from plough seated on a mule, to the sides of which their whole apparatus is tied: the use of fanners is unknown, except in the neighbourhood of sea-port towns, to which they have been imported from England; corn is winnowed by throwing it up in the air, and it is more frequently ground by hand, than by either wind or water mills. (*Cooke's Sketches*, ii. 40–42.) Land is not supposed to yield to the proprietors more than 13, or at most 2 per cent.; for, when the tenant has paid tithe, *primicias*, and other taxes, little more remains than half the produce, to pay both rent and labour. It is exceedingly difficult to estimate the rent of land by the English acre, from the great uncertainty and irregularity of the measures. The term *fanzagada* is used to indicate the extent of land on which a *fanzaga* of wheat may be sown, an extent which varies in every village: this quantity of land, whatever it may be, lets, according to circumstances, at from 12s. to 24s., the average value of a *fanzaga* of wheat being about 3s. 6d. Vine and olive-lands are measured by the *aranzada*, an equally vague standard. The wages of farm labourers average about 13d. *per diem*; or, if boarded with their masters, from 10d. to 10d. But, though tillage has been greatly extended during the present century, it is still true that in most parts of Spain no improvement has been made during the last 150 years; but it is otherwise in Biscay, Navarre, and Arragon. In the first two and spade husbandry pretty generally prevails, and every inch of arable ground near the roads seems to be carefully cultivated. The wheat raised in Biscay perhaps exceeds the consumption of the district, and considerable crops are also raised of rye, maize, barley, and oats. In Leon, Castile, and Andalusia, agriculture, which is in the most degraded state, is confined to the growth of wheat.

The most careful cultivation is found in the *huertas*, or irrigated lands of Granada, Murcia, and Valencia. These tracts, indeed, are considered as the gardens of Spain, and abound not only with every variety of fruits, but all kinds of vegetables and plants, useful either as food or materials for manufactures. The mild red pepper raised in the *huerta* of Murcia is celebrated all over Spain, and forms a considerable article of trade with the interior. Rice is the chief product of Valencia. The sugar-cane of Granada and Valencia is as good as that of the West Indies; but it is cultivated at much greater expense, and its growth has, in consequence, been almost wholly abandoned. Considerable quantities of corn are raised in different parts along the S.E. coast. Mulberry-trees are carefully cultivated in the S. provinces; those of Murcia and Valencia are white, those of Granada black. In the cultivation of vines poles are not used; but the cuttings are planted, and not being permitted to attain any great height, gradually form thick and very stout stocks. *Espalleros*, also, are numerous, especially in Andalusia, and the grapes on these vines attain an extraordinary size, the bunches often weighing from 12 to 14 lbs. The rich level lands produce the largest quantities of wine, but here, as elsewhere, that raised on gravelly soils on the hilly slopes is the best. The quality of the wine varies greatly in different districts; but it may be said with truth that, except the wines of Xeres, Rota, Malaga, Alicante, and Benicarlo, which are intended for exportation, few of the Spanish wines are equal even to those of third-rate quality in France. Being very generally kept in skins, smeared with pitch, they acquire an *olor de bota*,

or peculiar taste, and a flavour not disliked by the natives, but very disagreeable to foreigners.

It appears, from the official returns published in 1803, which, though not to be altogether depended upon, are sufficiently accurate to give a just notion of the general state of the country, that, taking the extent of Spain at between 18,900 and 19,000 sq. leagues, the surface was distributed nearly as follows:—

	Leagues.
Cultivated lands and fallows	- 4,510
Pastures and commons	- 11,638
Forests and copses	- 1,580
Mountains and rivers	- 1,542
	18,900

It is certain, from the increase of pop., and the nearly total cessation of importation since 1803, that the proportion of cultivated lands must have increased considerably in the interval, though at this moment they are still little more, perhaps, than about a fourth part of the entire surface. The Pyrenees, the hilly parts of Biscay and the Asturias, the vast plains of Andalusia, the two Castiles, Estremadura, and Leon, are almost wholly in pasture; and in some parts the traveller may journey for many miles without seeing either a house or an individual. In point of fact, however, half the pastures really consist of heaths, or of neglected tracts covered with thyme and other wild herbs, that at present are next to worthless. There are few or no irrigated meadows, and hay is seldom or never prepared for fodder. Indeed, notwithstanding the preference given to pasturage, and the privileges that have been long enjoyed by the migratory flocks, it is not supposed that the stock of sheep in Spain at this moment (1841) exceeds 13,000,000 or, at most, 14,000,000; whereas, in England, which has not 1-14th part of the pasture and waste land that belongs to Spain, the stock of sheep is certainly not under 25,000,000, while that of horses and cattle is proportionally great.

The Spaniards distinguish their sheep into the sedentary, or those who remain in the same place during the year; and the migratory, or those who move from place to place. The latter, or *trashumantes*, consisting chiefly of the merinos, or fine-wooled breeds, are depastured during winter in the vast plains of Andalusia, Castile, Leon, and Estremadura; and are driven in summer to the nearest mountains. These migratory flocks are collected for their journey in large bodies of 10,000 and upwards, called *mesas*, their peregrinations being regulated by a peculiar code of laws, and by immemorial custom. It is obvious that this migratory system has originated in natural causes; and that, in fact, it is an important branch of the rural economy of Spain. In winter, when the mountains are covered with snow, the plains are in the greatest verdure and beauty; and in summer, again, when the herbage of the plains is withered and burnt up by the heat and drought, the pastures of the Sierras, and other mountain tracts, are in a state of comparative luxuriance. Nothing, therefore, can be more natural than this shifting of the flocks; it is for the mutual interest of the occupiers of the hills, and those of the plains, and no doubt has prevailed in Spain from the remotest antiquity, and will necessarily continue to prevail.

The laws and customs, however, under which the migrations of the flocks are conducted have been, for a lengthened period, singularly inexpedient and oppressive. It appears that, about the middle of the 14th century, the depopulation of large tracts of country by a pestilence gave a considerable extension to pasturage; and enabled the proprietors of the migratory flocks to usurp certain privileges, which they have since succeeded in maintaining. (*Toussend*, ii. 61.) Thus, they are not only allowed to drive them over village pastures and commons, but the proprietors of such cultivated lands as lie in their path are obliged to leave for them a wide track, and, which is still worse, no new inclosures can be made in the line of their migrations, nor can any land that has once been in pasture be again cultivated till it has been offered to the *mesa* at a certain rate! In consequence of these perverse arrangements, disputes, which frequently terminate in bloodshed and murder, are perpetually taking place between the herdsmen and those through whose lands the flocks have to pass. On the whole, however, we incline to think that the mischiefs said to be entailed on Spain by the laws and customs in question have been a good deal exaggerated. As already seen the migration of the flocks is essential in Spanish rural economy; and it does not appear, were government to set resolutely about the matter, that any insuperable difficulty would have to be encountered in defining and fixing the roads to be taken by the flocks, and in otherwise regulating their migrations, so as to prevent them from being injurious to third parties.

It may be worth mentioning, that Canmayn ascribes the first great improvement in the wool of Spain to the introduction of a flock of sheep from England, in 1394,

being a portion of the dowry brought by Catherine, daughter of the Duke of Lancaster, to her husband, the eldest son of the King of Castile. (See *Questions Critiques*, 9.; and *Memorias Historicas sobre la Marina, Comercio, &c. de Barcelona*, iii. 336.)

The low state of agriculture in Spain may be ascribed partly to physical and partly to moral causes. At the head of the former must be placed the heat of the climate, and the aridity of the soil. Most part of the rivers with which the country is intersected run in deep beds, and are but little available, except in a few favoured localities, for purposes of irrigation. Probably, however, moral have had still more influence than physical causes in retarding the progress of agriculture in the Peninsula. At the head of the former must be placed the vast extent of the lands belonging to the nobility, clergy, and corporations. Mr. Townsend mentions, that the estates of three great lords—the dukes of Osuna, Alba, and Medina Celi, cover nearly the whole of the immense province of Andalusia, and several in the other provinces are hardly less extensive (ii. 238). These vast possessions are uniformly held under strict entail; and, speaking generally, are all managed by stewards, anxious only to remit money to their masters, who are frequently in embarrassed circumstances. The younger branches of the great families, though they inherit all their pride, inherit little or none of their wealth. They are, for the most part, exceedingly ill-educated; and when not employed in government service, pass their days in a state of slothful dependence. It is singular, notwithstanding their immense possessions, that the Spanish grandees have little or no taste for a country life, or for the improvement of their estates; and the fact is, that from the one end of the Peninsula to the other, there is no such thing as a fine country seat. The great estates belonging to the corporations, or towns, are held in common; and, in consequence, are wholly, or almost wholly, in pasture. Luckily, however, the large estates that belonged to the church have been confiscated during the late revolutions; and their sale and division will materially increase the number of smaller proprietors, and give a powerful stimulus to improvement; and a stop has also been put to the practice of entailing. The interruption given to labour, by the immense number of religious festivals and saints' days, has, also, been exceedingly injurious to agriculture and all sorts of industry.

The Spanish character is also unsuitable to success in agriculture and manufactures. During the prolonged struggle with the Moors, a taste for daring adventures, and for an irregular predatory mode of life, was widely diffused throughout the nation; and the discovery and conquest of America, which occurred nearly at the same time that the power of the Moors was annihilated by the conquest of Granada, afforded a new and boundless field for the exercise of the peculiar taste and talents formed in the Moorish wars. In addition to the means thus afforded of arriving at wealth and distinction by a more compendious and less laborious, though more hazardous, route than that of sober industry, those honorary distinctions of which the Spaniards are extremely fond were conferred only on those who followed the profession of arms, and who could show that their ancestors had not degraded themselves by engaging in the debasing pursuits of agriculture, manufactures, and commerce! And while the higher and more aspiring classes were thus led to regard the useful arts with contempt and disdain, the multiplication of convents and such like establishments afforded the means of keeping a vast number of individuals in pampered idleness. We need not, therefore, wonder at the repeated complaints that have been made by native and foreign writers of the pride and laziness of the Spaniards. (See *Capmany, Questions Critiques*, pp. 46–49, &c.) What else could be expected in a country where agriculture and the useful arts have, for a lengthened period, been looked upon as mean and sordid, and below the attention of a gentleman? The heat of the climate was enough, of itself, to enervate the inhabitant, and render him indolent; and when we add to this the powerful influence of the causes now shortly glanced at, with the want of leases and roads, and the oppressiveness of taxation, need we wonder at the backward state of agriculture and of the other useful arts in Spain?

There are several societies in Spain, assuming the title of "Friends of the Country," for the encouragement of agriculture and the arts; most of them were founded in the reign of Charles III., and were warmly patronised by Campomanes, the most enlightened minister of whom Spain has to boast, and by Count Florida Blanca. Hitherto, however, they seem to have rendered but little service, if we except that of Madrid, to whose exertions the famous *Memoir of Jovellanos (Informe de la Ley Agraria)* is principally to be ascribed. The reader will find this memoir in an English dress in the 4th volume of the translation of the *Trésor de Laborde*.

*Manufactures.*—It might have been expected, from

the abundance of wool and silk in Spain, and her extensive colonies in America, that her manufactures would be in a comparatively flourishing state. This, however, is not, nor has it ever been, the case. Capmany, and other able writers, have shown that the statements as to the flourishing state of manufactures in Spain, in the 14th and 15th centuries, have no better foundation than those respecting the flourishing state of agriculture, and the magnitude of the pop. at the same period. Some of the circumstances that have contributed to depress agriculture have also contributed to depress manufactures; but they have, also, been affected by others of a peculiar description, among which may be specified the oppressive influence of the *alcabala*, and other taxes (see *post*), corporation privileges, monopolies on the part of government, and the want of competition and emulation through the exclusion (in as far as practicable) of foreign manufactured goods. Catalonia, Biscay, and Valencia are the most industrious provinces, and in their manufactures are most advanced. Those of silk and cotton, especially the first, are carried on to a considerable extent in Barcelona, Valencia, and other towns; but though the fabrics be excellent, the colours are wretched. The blonde mantillas of Almagro, in La Mancha, are, perhaps, the best of the Spanish manufactured articles. The finest broad cloths are made at Alcoy, in Valencia; and coarse cloths (*pano pardo*) are extensively manufactured in Catalonia, and in various districts throughout the country. But, with the exception of silks, all the woven fabrics produced in Spain, whether woollens, cottons, or linens, are at once badly finished and enormously dear: even the coarse, hard-spun mantas, that serve the mulattoes for cloaks and blankets, fetch prices that would astonish the peasantry of England and France. In the N. provs. tanning is the most important branch of manufacture, furnishing the principal supply of leather for the interior: the business was introduced by and is chiefly in the hands of the Basques from the French side of the Pyrenees. The forest works of Andalusia are mostly in the hands of Englishmen. The manufacture of paper and hats has been established with some success; and there are numerous potteries, though the products be principally of coarse quality. In Valencia and Catalonia, however, finer articles are made; but even there the art is only in its infancy. There is a royal porcelain manufactory at Madrid, on the plan of that of Sevres, occasioning, like its prototype, a constant loss. Soap is made on a somewhat extensive scale in various parts of Spain, that of the best quality being exported. In Biscay, the production and manufacture of iron has been for many years conducted with considerable activity; and it is probable that the depression occasioned by the late civil war, of which Biscay was the principal seat, has already been removed. It is impossible, however, that the iron trade of Biscay, how abundant soever the ore, can rise to any great importance; since wood fuel is scarce, and coal, being at a considerable distance from the roads of export, is little used; while English coal, which might be procured at about 1-3rd the price, is strictly prohibited. Still, however, to some extent, at least, in almost every village of the prov., the iron-ware manufacture is carried on. Horse-shoes and nails, coarse locks, guns, and bedsteads, are the leading articles with which the Biscay manufacturers supply the interior: large copper utensils are also made on a considerable scale in this part of Spain. Muskets, pistols, and sabres are manufactured by the government in Valencia; and several minor establishments exist at Saragossa, Barcelona, Malaga, Cadiz, and Seville. The sabre manufacture of Toledo, once so highly celebrated for its finely tempered sword-blades, has all but fallen to decay, only 50 workmen being employed at the time of Ingalls's visit. (*Spain*, i. 312.) The manufactures of saltpetre and gunpowder, brass cannon, tobacco, porcelain, tapestry, and mirrors, are conducted exclusively by government; the supply is very limited, the prices of the articles produced extravagantly high, and, excepting tobacco, they are all productive of loss. In some parts, mats, shoes, and other articles, are extensively made of the esparto rush.

*Commerce.*—It is the peculiar misfortune of Spain that every part of her political system has been alike vicious and objectionable. Had her commercial policy been liberal, it would, in some degree, have compensated for the defects in the distribution of property and political power, and would, no doubt, have given a powerful stimulus to industry. But, unluckily, it has been in perfect harmony with her other institutions, and is, in all respects, worthy of the favourite seat and stronghold of the Inquisition. From the reign of Ferdinand and Isabella down to the present time, the policy, if so we may call it, of the Spanish government has been wholly anti-commercial. Their grand object has been to exclude foreign manufactures from the Peninsula, and to preserve a monopoly of its markets, as well as of those in the colonies, to the home manufacturers. It is, however, almost needless to say, that their efforts to bring about this

result have been signally unsuccessful. The oppressive taxes imposed on the manufacturers, the multiplication of fasts and holidays, the government monopolies, the badness of the roads and other means of communication, made it impossible for the Spanish manufacturers, even if they had evinced greater enterprise and industry than they have done, to produce manufactured articles as cheap as the English, the French, and others less unfavourably situated. Under such circumstances, the prohibition of certain descriptions of commodities, and the oppressive duties laid on others, could have no effect except to suppress the legitimate commerce of the country, and to throw it wholly, or almost wholly, into the hands of smugglers. Any one who takes up a map of Spain must be satisfied at a glance that it would be impossible, even for an army of customs' officers, to prevent her being deluged with smuggled products, provided they were materially cheaper than her native products; for, besides her extensive sea frontier, they may be introduced by way of France and Portugal, and also through the Basque Provinces, which have distinct laws, and enjoy an exemption from the usual customs inflicted on the rest of the kingdom. We need not, therefore, be surprised that every effort to prevent the clandestine introduction of foreign productions should have completely failed. The severities occasionally inflicted on the smugglers, instead of abating, seem really to have increased, the evil. The contraband trade has long been a favourite occupation, and has been eagerly followed by the adventurous, the necessitous, and the desperate. It is believed that for nearly three centuries from 100,000 to 150,000 individuals have been pretty constantly engaged in this occupation; that is, they have been engaged in tramping on the laws, obstructing their officers, and committing acts of violence and blood. When Mr. Townsend travelled in Spain, the country was a prey to the disorders occasioned by this wretched system. But it was to no purpose that the experience of two centuries, and the writings of various able men, had conclusively demonstrated its destructive influence. The government and the people, thanks to the influence of the Inquisition and the clergy, were so ignorant and infatuated as to shut their eyes to its effects, and to resist every attempt to modify it, or to render it less hostile to the public interests.

And, strange to say, notwithstanding all the vicissitudes Spain has undergone in the interval, her old anti-commercial policy still continues to maintain its ascendancy. At this moment a half or more of the entire trade of the country is in the hands of the *contrabandistas*. The existing tariff is divided into 15 classes; and in addition to hundreds of prohibitions, and duties varying from 50 to 200 per cent. on many articles of the first importance, the numerous fortresses to be observed at the custom-house, and the delays in entering any article, constitute of themselves a considerable premium on smuggling. It is stated that at present about 3,000 actions are annually instituted against *contrabandistas* and others engaged in illicit trade, which terminate in the ruin of a vast number of families; at the same time that the courts of law are filled with perjury, and the country with bloody conflicts. And yet these atrocities secure no one object government has in view; foreign goods may be bought, though at an enhanced cost, in every market in Spain; the home manufactures are in the lowest state of degradation; industry of all kinds is paralysed; and the customs' revenue does not exceed a fourth part certainly of what it would amount to under a liberal commercial code! The truth is, that a thorough reform in her commercial policy is absolutely indispensable to give Spain even a chance of being regenerated. So long as the present tariff is maintained, so long will she be a theatre of sanguinary contests; without industry, without civilisation,—a reproach and a disgrace to Europe.

As a specimen of the way in which the tariff is framed, we may mention that, notwithstanding the vast importance of a cheap and abundant supply of iron to agriculture and manufactures, wrought-iron articles are wholly excluded, at the same time that a duty of 200 per cent. is imposed on iron in bars (*en bruto*)! This, of course, is done to protect the iron-masters and founders of the Basque Provinces! In other words, a trifling advantage is conferred on one individual in 100, at the expense and to the serious injury of the other 99!

Inasmuch as the returns published by the Spanish authorities of the value of the import and export trade of the country include only the commodities that pass through the custom-house, it is obvious, from the previous statements, that they are really good for nothing.\* According to the *Balanza Mercantil* for 1838, the aggregate value of the goods imported at 11 of the principal ports, during the course of that year, amounted to 1,615,000*l.*; whereas the value of the exports from the

same ports, during the same year, is said to amount to 2,113,888*l.* It is, however, abundantly certain that the value of the imports must have exceeded that of the exports; and the reason why they are apparently so much below the latter is to be found in the fact, that, being more generally subject to prohibitions and heavy duties, the trade in them is thrown, to a greater extent, into the hands of the smugglers. In illustration of what has just been stated, we may mention that the value of the exports to Great Britain, in 1838, is estimated, in the *Balanza Mercantil*, at 1,327,470*l.*; while that of the imports from Great Britain is set down at only 149,405*l.*! In point of fact, however, we send about 400,000*l.* worth of produce direct to Spain, exclusive of the farther and more considerable amount smuggled through Portugal, Gibraltar, &c. We incline to think that, allowing for smuggling, the import and export trade of Spain may each be estimated at about 4,000,000*l.* sterling, or, perhaps, a little more. And, considering the vast, and, as it were, unexplored resources of the country, and the infinite variety of desirable products she could supply to others, we have no doubt, that under a liberal commercial system, her commerce would speedily be trebled, and that, at no very distant period, it would be increased in a tenfold proportion.

The great articles of export from Spain consist (exclusive of silk manufactures) of raw products. Of these, wine, wool, fruits of various kinds, lead, quicksilver, brandy, barilla, olive oil, raw silk, wheat, &c. are the most important, and are almost all susceptible of an indefinite increase. We subjoin, in illustration of the export trade of Spain, an

ACCOUNT of the Quantities of the principal Articles of Merchandise imported into the United Kingdom from Spain and the Balearic Islands in 1838 and 1839.

Articles.	1838.	1839.
Barilla and alkali - - - cwt.s.	38,624	29,744
Cochineal - - - lbs.	7,524	
Coffee - - - - -	115,993	
Figs - - - - - cwt.s.	2,557	5,963
Lead - - - - - lbs.	1,560,380	2,225,002
Lemons and oranges - - - chests	27,051	31,027
Liquorice juice - - - cwt.s.	1,297	391
Olive oil - - - galls.	57,813	136,167
Quicksilver - - - lbs.	1,560,380	2,225,002
Raisins - - - cwt.s.	162,318	180,009
Raw silk - - - lbs.	1,487	901
Thrown do. - - - No.	1,261	1,998
Lamb skins (undressed) - - - No.	16,560	220,527
Brandy - - - galls.	19,560	220,527
Sheep's wool - - - lbs.	1,811,877	2,109,634
Spanish wines - - - galls.	3,314,858	4,052,707
Wheat - - - qrs.	421	17,741
Peruvian bark - - - lbs.	-	1,517

The great articles of import are colonial products, obtained principally from Cuba, Porto Rico, &c.; cottons and cotton wool; linens, and hemp and flax; woollens; salted fish; hardware, glass, and earthenware; timber, rice, hides, butter and cheese, &c.

The importance of the trade that Spain formerly carried on with her vast possessions in the New World, was, at all times, much exaggerated; and she in truth was little better than an agent in the business, the greater part of the goods sent in Spanish bottoms to the colonies being, in reality, the property of foreign merchants. Spain, notwithstanding the emancipation of Mexico and South America, has still some very valuable colonies; and, if nothing else can, the astonishing progress made by Cuba and Porto Rico, since the abolition of the prohibitive system, should satisfy her of its ruinous tendency.

Owing to the badness of the roads, and their unsuitness for carriages, the principal carriers of merchandise are the *arrieros*, or muleteers, who traverse the country in all directions along beaten tracks, many of which are accessible only to them. They form a large part of the provincial population, and, on the whole, have a good character for honesty to their employers, though they are nearly all, more or less, engaged in smuggling transactions. The extent of this traffic may be estimated from the fact, that about three-fourths of the entire inland traffic in corn is carried on by their means. Recently, however, waggons have begun to be introduced on all the practicable roads, and should the latter be improved, the business of the *arrieros* will proportionally fall off.

**Currency.**—The trade of a banker, as it is understood in Great Britain, is unknown in Spain; but there is, notwithstanding, an extensive circulation of inland bills of exchange. All merchants in good credit call themselves bankers, do banking business, and have agents and connections in the different towns, to facilitate their operations; but there is, notwithstanding, considerable difficulty in remitting money from place to place, and a different rate of exchange frequently exists between towns only a few leagues distant. In ordinary transactions there are no substitutes for cash, and a good

\* Moreau de Jonnés, in his *Statistique de l'Espagne*, gives the official returns of the imports and exports, without insinuating any doubt as to their correctness. It is the same with most other statements in that work; which, in fact, is good for little, unless it be to bring statistical statements into discredit.

deal of trouble and inconvenience is experienced in counting, examining, and weighing the coins.

Accounts are kept in *reales de vellon*, of which about 90 are equivalent to 1*l*. The pistole is worth 16*s*. 9*d*. British currency. The money in circulation consists of gold and silver coins of very various value, and of copper. Dollars are rarely seen, especially in the N. and near the sea-coast, in consequence of the premium they bear in France, to which they are smuggled in large quantities, notwithstanding the penalties consequent on their exportation. Travellers are allowed to carry out of the country a sum for their expenses, amounting to 20*l*. in gold only; and should they be found, on examination, to have more, the whole may be seized. Oil is sold by the *arroba mina*, 100 of which are equal to 335 English wine-gallons: 4 *arrobas* are equal to a quintal, or 102 English pounds. The *cahiz*, or measure for corn, is divided into 12 fanegas, 5 of the latter being equal to 1 quarter. One hundred Spanish *varas*, or yards, are equal to 92.5 Eng. yards, and a Spanish *legua* contains 5,000 *varas*. The traveller tries in vain to find a rule whereby he may compare the Spanish land measures with the English acre; and, with respect both to weights and measures generally, they vary greatly in different provinces.

**Roads and Canals.**—Spain is singularly destitute of roads, and other means, for the speedy and easy transport of travellers and products from place to place. The king's highways (*caminas reales*), the only roads worthy of the name, extend only between the more important places: some of them, as, for instance, those between the capital and Pampeluna, Saragossa, Badajoz, Seville, and Granada, are, generally speaking, kept in good repair; and the great road from Pampeluna, by Vittoria, Burgos, and Valladolid, to Madrid, is stated by recent travellers to be scarcely inferior to the second-rate roads of England. The great road to Valencia, though probably somewhat improved since the revolution, was previously in a wretched state; and so likewise is that running by Tarancon and Albacete into Murcia. In Catalonia, the roads are comparatively numerous and good; stage-coaches, also, run between the more important towns. The road from Saragossa to Barcelona is in good repair, and a diligence has been established on it since 1831. The roads of Biscay and Navarre, also (owing to their being placed under a provincial government), are more numerous, better constructed, and more carefully managed, than in the rest of the country. The great complaint with respect to these roads, whether originally made with road-metal, or formed partly by tracks of carts, and afterwards improved, is, that they are seldom provided with bridges over the numerous torrents pervading the country, and scarcely ever kept in proper repair. The mountain-roads are mere paths worn by the feet of the mules during a long series of years. The revenue applicable to the construction and repair of roads is derived partly from local taxes, levied by postage-dues, and duties on articles of consumption; and partly, also, on tolls levied at intervals of 10 or 12 English miles. The tolls appear to be light; but the government is said to derive from them a greater revenue than it expends on the roads. The *carreteras reales* are under the superintendence of a board under the presidency of the Board of Finance, and the government funds are available only for these roads, the rest being left either to the chance sums levied on travellers, or to the wheels of carts and the feet of mules! With respect to the sums of money employed in repairing roads in Spain, it may suffice to state, that although that country be more than three times the size of England, and naturally more difficult, the outlay on roads in it is hardly one twentieth part the sum expended on those in England. The diligences on the principal roads are decidedly better than might have been expected, and travel at a rate of 6 or 7 m. an hour; they are far, however, from being safe conveyances, and instances are every now and then occurring of their being stopped and the passengers robbed.

No country in Europe is worse provided with canals than Spain, though, looking at the map merely, one would suppose that in none were there greater facilities for their construction. But the imbecility of the government, the ignorance of the people, the porousness of the soil, and heat of the climate, oppose very serious obstacles to their formation. Still, however, some advances have been made, and the government of Isabella II. may, in this respect, be advantageously contrasted with that of Charles II. During the reign of the latter, a company of Dutch contractors offered to render the Manganares navigable from Madrid to where it falls into the Tagus, and the latter from that point to Lisbon, provided they were allowed to levy a duty for a certain number of years on the goods conveyed by this channel. The council of Castile took the proposal into their serious consideration, and, after maturely weighing it, decided, "That if it had pleased God that these two rivers should have been navigable, he would not have wanted human assistance to have made them such; but, as he had not done it, it is plain he did not think it proper that it

should be done. To attempt it, therefore, would be to violate the decrees of his providence, and to mend the imperfections which he designedly left in his works!" (*Clarke's Letters on Spain*, p. 284.)

But such undertakings are no longer looked upon as sinful, and several have been projected, and a few completed, since the accession of the Bourbon dynasty to the throne of Spain.

The canal of the Ebro, from Tudela to Santago, 41 m. below Saragossa, was chiefly executed in the reigns of Charles III. and IV., under the administration of Count Florida-Blanca; and though of insufficient depth for navigation on any large scale, it is made available during nearly its whole extent for barges of small draught, besides being extremely useful for the irrigation of the surrounding country.

The most important project of this kind at present on foot is the canal of Castile, intended to open a communication between the vast and fertile plains of Old Castile and Leon, and the N. Sea, and to afford an outlet for their surplus produce. It has been constructed from Segovia on the S., past Valladolid and Palencia to Aguilar del Campo; a branch runs westward to the Rio Seco, and another is in course of construction to Burgos. The inefficiency of the engineering processes, the difficulty of procuring good labourers, and the nature of the soil, have presented serious obstacles to the undertaking, which has now been in progress, with certain intermissions, since 1753, and has not yet been completed! A large portion is now, however, available for navigation; and the advantages that would result from its completion are so great, that it may be expected that a vigorous effort will speedily be made to have it terminated. The navigation of the Tagus has, also, engaged the attention of different Spanish sovereigns; and at the close of the 16th century the river is said to have been made navigable for barges from Toledo to its mouth; but, if so, it was subsequently rendered useless through neglect, and it is only within the last few years that a company has undertaken to make it navigable from Aranjuez (23 m. above Toledo) down to Lisbon. The long-pending question respecting the right of the Spaniards to navigate the lower part of the river has at length been settled, and there is now no reason why small steamers should not ascend as high as Toledo into the richest part of New Castile, thus establishing a valuable trading connexion between the inhabs. of the interior and of the greatest emporium on the coast of the Peninsula.

The Guadalquivir was once navigable for flat-bottomed boats up to Cordova, but Seville is the highest point reached at present. Many projects have been set on foot for improving the river by deepening the channel; but the great and sudden floods to which it is subject must operate as a bar to its successful navigation; nor, even if the part above Seville were considerably improved, is it at all probable that the bars and sand-banks of the marshy district known as the *Mármora* could be so far removed as to make the river accessible by sea-borne vessels even as far as Seville.

**Population.**—We have already noticed the exaggerated and unfounded statements with respect to the former flourishing state of agriculture, manufactures, and commerce in Spain. Inasmuch, however, as the population of a country is mostly dependent on its agriculture and manufactures, it follows that the same facts and reasonings which show that their extent and prosperity in the 14th and 15th centuries had been greatly exaggerated, go far, also, to show that this must have been the case with regard to the accounts of the comparatively dense population of Spain at the era alluded to. Down to the 15th century, or to the junction of the crowns of Castile and Aragon by the marriage of Ferdinand and Isabella, Spain was divided into a number of states, between which the most violent animosities subsisted, and most parts of the peninsula were a prey to violence and every species of disorder. It would be contradictory and absurd to suppose that a country placed under such circumstances could be densely peopled; and Capmany has conclusively shown that there are really no grounds whatever for thinking that Spain had been at any time more populous than at the period (1807) when his acute and learned work, the *Questions Critiques*, was published. No doubt, however, the population of Spain declined considerably during the disastrous reigns of Philip III., Philip IV. and Charles II. This decline has been ascribed, in great part at least, to the expulsion of the Moors in the reign of Philip III. But, though it be impossible too strongly to condemn this measure, and that of the expulsion of the Jews during the reign of Ferdinand and Isabella, and the detestable fanaticism in which these acts originated, we are, notwithstanding, inclined to think that their influence has been a good deal over-rated. The numbers expelled were magnified far beyond the truth; and it is farther obvious that the vacuum, such as it was, created by their expulsion, would, in ordinary circumstances, have afforded a new field for the employment of those who continued in the country.

and have acted, in fact, as a stimulus to population. Neither are we inclined to lay any stress on the statements of those who contend that Spain was depopulated by the emigrations to America. These were far too inconsiderable to have any such result. No one pretends that the emigrations to America depopulated England; and yet they were quite as extensive as those from Spain. Indeed, Ulloa, Ustariz, and Campomanes have conclusively shown that the emigrations from the Peninsula had, in no degree, the effect ascribed to them.

The truth is, that the decline of pop. between the demise of Philip II. and the termination of the war of the succession, was a consequence of continued and systematic misgovernment, rather than of any particular acts of oppression. The rapacity, intolerance, and influence of the Spanish clergy, the *feudal* character of her financial system, the destructive contests in which she was engaged, the weakness of her sovereigns, and, in a word, her wretched internal policy, prostrated her energies, paralysed her industry, and not only prevented her recovering from, but aggravated, the wounds inflicted by the bigotry of her rulers. But, under the milder, more intelligent, and equitable administration of the Bourbons, some improvements took place; and the pop. having increased gradually, though slowly, during the whole course of last century, is now certainly as great as at any former period of her history, and perhaps greater. "*No por eso puede decirse, que la España haya estado mas poblada que al presente, ni en tiempo de los Romanos, ni en el siglo 16; en cuya época suponen algunos escritores arbitrariamente que llegó a 20 ó 21 millones el número de sus habitantes. Por el contrario, todos los datos mas exactos, y las combinaciones mas racionales, persuaden, que no hubo entonces sobre la superficie de España mas de los 10 millones de almas, a que el mismo censo reduce su población actual.*" (Andúzar, *Geografía*, 147.) In 1787 the pop. amounted to 10,268,150, or perhaps 10½ millions, as it is believed, on apparently good grounds, that the official returns were below the mark; and since then it has increased nearly two millions.

Under the existing constitution, there is to be a deputy for every 50,000 inhabs.; and according to the decree issued on the 3d of Aug. 1837, appointing the deputies for the different provinces, the total pop. of the kingdom amounted to 12,168,000 (see Table at the beginning of this article). We believe, however, that no very great dependence can be placed on this return, though, probably, in the result it is not far from accurate.

**Religion.**—Spain has long been, and still is, the favourite seat of the Rom. Cath. religion, the country in which it has been maintained in the greatest purity, and to the exclusion of every other. The Inquisition was introduced, or, at all events, was vested with a vast increase of power, in the reigns of Ferdinand and Isabella; and that formidable tribunal ultimately succeeded, by dint of the stake and the rack, and such like atrocious means, in exterminating heresy, or, in other words, all difference of opinion as to religious matters in Spain; and it was, also, mainly instrumental in prevailing on its weak and bigoted sovereigns to banish the Moors. According to Llorente, no fewer than 13,000 individuals, accused of heresy, were publicly burned by the different tribunals of Castile and Aragon; and 191,413, accused of the same offence, suffered other punishments in the brief space between the establishment of the modern Inquisition in 1481 and 1518, only two years after the death of Ferdinand; and since then the number of its victims has been incomparably greater! (*Prescott's Ferdinand and Isabella*, iii. 465.) Probably this statement may be exaggerated; but it is, notwithstanding, abundantly certain, that all other persecutions of which we have any authentic accounts have been mild compared with those inflicted by this blood-thirsty tribunal. In point of fact, however, the mischievous influence of the Inquisition did not consist so much in its judicial murders, and other atrocities perpetrated in the sacred name of religion, as in its deadly influence over the mind and feelings of the nation. It was, as every one knows, quite as hostile to all sorts of political and philosophical knowledge as to heresy in religion; it was, in fact, the deadly foe of every thing like free inquiry; and while the importation of most useful works from foreign countries was a capital offence, nothing could be printed at home unless it were approved by the Inquisitors. Under such circumstances, need we wonder at the ignorance of the Spanish people, their bigotry, intolerance, and the profound veneration they so long displayed for whatever is most worthy of contempt?

The numbers and wealth of the clergy and monastic orders were such as might be expected in a country where the Inquisition was triumphant, and where to commit a murder was a less offence than to insinuate a doubt as to the "real presence!" According to an official statement drawn up in 1812, it appears that the clergy were then in possession of about one fourth part of the landed property of the kingdom, exclusive of tithes and other casual sources of income, producing in all a

total gross revenue of about eleven millions sterling a year! The revenues of some of the dignified ecclesiastics were quite immense: the archbishopric of Toledo is said to have been worth from 65,000 £ to 80,000 £ a year.

According to the official returns of the census of 1787, the ecclesiastics of all descriptions, including 61,617 monks, 32,500 nuns, and 2,705 inquisitors, amounted to 188,625 individuals. (*Tourneuf*, ii. 213.) And it appears, from the official returns published in the *Correo Literario* of Madrid in 1833, that, notwithstanding the attacks made upon the ecclesiastical state during the French war and subsequently, it then comprised 175,574 individuals, of whom 61,727 were monks, and 24,007 nuns.

Happily, however, a very great change for the better has been effected in the interim. A decree, passed on the 23d of July, 1835, suppressed all conventual establishments with not more than 12 inmates; and the example thus wisely set was followed up by the decree of the 9th of March, 1836, which entirely suppressed all conventual establishments, and religio-military orders. The monks who were thus turned out of their old haunts were to receive small stipends; and it is to be regretted that, owing to the difficulties in which the country has since been involved, these stipends have been very irregularly paid. But the inconveniences thence arising affect only a few individuals, whose claims on the public sympathy were of the slenderest description; whereas the measure in which they originate cannot fail to be productive of great national advantage, and is, in fact, one of the most beneficial results of the late changes.

The whole of the vast property formerly belonging to the church has been confiscated for the use of the state, and a considerable portion of it has been already sold. According to the constitution, the nation undertakes to support the public worship and clergy of the established church; but, owing to the intestine commotions that have prevailed in the country, and its financial difficulties, this condition has not been effectively carried out; and not a few of the clergy are, at present, but little removed from a state of indigence.

It should further be borne in mind that, during the last half century, and especially since the commencement of the late struggle with France, the bigotry of the Spaniards, especially of the inhabs. of towns, and the influence of the priests, have materially declined. And, by a necessary, though unfortunate, consequence, the abuses and vices of the clergy have reacted against religion itself; and, at this moment, most intelligent persons in Spain, though making an outward profession of religion, entertain a profound contempt for the mummeries enjoined by the clergy, and are mostly, indeed, decided sceptics. Accordingly, however, as the church is purified, and ceased to be identified with every thing most deserving of reprobation, religion will, no doubt, recover its proper influence, and will cease to be degraded in the public estimation by the intolerance, extortion, and immorality of its professors.

**Government.**—At the period of the union of the crowns of Castile and Aragon, by the marriage of Ferdinand and Isabella, each of the kingdoms had representative assemblies, or cortes, that shared in the legislative authority, and enjoyed very extensive privileges. Unluckily, however, though the crowns were united, by the marriage now referred to, the kingdoms were not; each continued to preserve its own laws and institutions; and their mutual jealousies enabled the sovereigns to employ the one against the other, and ultimately to crush the liberties of both. This result was greatly facilitated by the extensive conquests of the Spanish sovereigns. In the reign of Ferdinand and Isabella, Granada, Navarre, and Naples, were subjected to the Spanish crown; so that the princes became, in a great measure, independent of the constitutional control of the cortes of their hereditary states. Under Charles V., who possessed, in right of his father, all the dominions of the house of Austria, and under whom all but boundless territories were acquired in the New World, the preponderance of the external dominions of the crown was vastly increased; and the defeat of the forces of the rebellious Castilians, under Pádilla, in his reign, and the execution of the Justiza of Aragon in that of Philip II., completed the extinction of all constitutional control on the acts of the sovereign; at the same time that the Inquisition having first controlled, and now annihilated, all energy and independence of mind, the nation gradually sunk into a state of torpor and stupid indifference.

This state of things continued, with slight interruptions, till the invasion of Spain by Napoleon; when the mortified pride of the nation made them take arms in defence of their independence, and of the rights of the worthless imbeciles who had abdicated the crown. It is useless to enter into any details as to the events that followed. The novel circumstances under which the nation was now placed made it necessary to convolve her ancient cortes, and in 1812 a constitution was formed on a representative basis. This constitution was, however, abolished by Ferdinand the moment he was set at liberty

by the French, in 1814; and from this period down to 1820, the ungrateful and vindictive bigot exerted himself to effect the ruin of those to whom he was mainly indebted for the crown, and even went so far as to restore the Inquisition that had been suppressed by the French. But the army, and a large portion of the nation, disgusted at these measures, broke out in rebellion, and Ferdinand was compelled to accept the constitution of 1812. Owing, however, to the influence of the priests, and the ignorance of a large proportion of the population, the constitution was by no means acceptable to very many classes; and the French having entered Spain with a powerful army, under pretence of restoring order, the constitutionalists were every where defeated, and Ferdinand was once more restored to absolute power.

Ferdinand having expired in 1833, his infant daughter, Isabella II., was proclaimed queen, in virtue of a law entitling her to the crown in preference to her uncle, Don Carlos, the heir of the crown under the Salic law, which had previously obtained in Spain. This led, as every one knows, to an obstinate civil war, which fortunately terminated in the total defeat of Don Carlos and his claims.

In 1834, after the demise of Ferdinand, Christina, the queen-regent and mother of Isabella, proclaimed a charter for the Spanish nation, called the *Estatuto Real*; but it gave little or no satisfaction to the liberal or constitutional party, by whom the pretensions of her daughter were supported, and the queen was obliged to issue a decree, pledging herself to adopt the constitution of 1812, with such modifications as the Cortes might agree to. And this constitution having in consequence been subjected to a careful and judicious revision, a new constitution, which is now (1842) in force, was promulgated at Madrid on the 16th of June, 1837. As this is a document of much importance, and has been, and no doubt will be, much referred to, the reader may not, perhaps, be disinclined to have it fully laid before him:—

#### CONSTITUTION OF THE SPANISH MONARCHY PROCLAIMED IN MADRID ON THE 16th OF JUNE, 1837.

**DOÑA ISABELLA THE SECOND**, by the grace of God and the Spanish monarchy, Queen of Spain; and in her royal name, and during her minority, the Queen Dowager, her mother, Doña Maria Christina de Borbon, Regent of the empire; to all those to whom these presents may come, be it known, That the Cortes general have decided and approved, and that We in due form have accepted the same, as follows:—It being the will of the nation to revise, in virtue of its sovereignty, the political constitution promulgated in Cadix on the 19th day of March, 1812, the Cortes general, assembled for this purpose, decree and approve the following Constitution of the Monarchy of Spain:—

"Art. 1. Spaniards are, 1st. All persons born in the Spanish dominions. 2d. The children of Spaniards, though born out of Spain. 3d. Strangers who have obtained letters of naturalisation. 4th. Those persons who, without letters of naturalisation, obtain a right of settlement in any part of the monarchy by special law. The rights of Spanish citizens are preserved to foreigners who are naturalised, and by accepting employment under any other government without the permission of the sovereign of Spain.

"Art. 2. All Spaniards may print and publish their thoughts freely, without a previous censorship, but subject to the laws. The determination of offences by the press belongs exclusively to Juris tripartite for this purpose.

"Art. 3. Every Spaniard has the right of petitioning in writing to the Cortes and King on the last day of the year.

"Art. 4. The same code of laws shall govern in all parts of the monarchy, and in them shall be recognised by all Spaniards but one right in common trials of a civil or criminal nature.

"Art. 5. All Spaniards are eligible to public offices, according to merit and capacity.

"Art. 6. Every Spaniard is obliged to defend the country with arms in his hands whenever he may be called upon to do so by the law, and to contribute according to his abilities to the expenses of the state.

"Art. 7. No Spaniard can be detained, imprisoned, or taken from his family, nor his house entered, excepting in those cases and according to the forms determined by the laws.

"Art. 8. If the security of the state require, in extraordinary circumstances, the temporary suspension, in whole or in part, of the Spanish monarchy, the provisions of the preceding article are to be determined by the laws.

"Art. 9. No Spaniard can be presented or sentenced, except by a judge or competent tribunal, in conformity with laws enacted anterior to the commission of the offence, and in the manner laid by them.

"Art. 10. The confiscation of property is abolished, and no Spaniard is to be deprived of his property, except in cases justified by public utility, and with a previous indemnification of losses sustained.

"Art. 11. The nation is bound to maintain the public worship and ministers of the Catholic religion professed by the Spaniards.

#### "Of the Cortes.

"Art. 12. The power of enacting laws resides in the Cortes, in conjunction with the King.

"Art. 13. The Cortes is composed of two co-legislative bodies equal in powers—the Senate and the Congress of Deputies.

#### "Of the Senate.

"Art. 14. The number of senators shall be equal to three fifths of the whole number of the deputies.

"Art. 15. The senators are appointed by the king, from a triple list proposed by the electors of each province who elect the deputies.

"Art. 16. To each province belongs the right of proposing a number of senators proportional to its population; but each is to return one senator at least.

"Art. 17. To be a senator it is necessary to be a Spaniard, to be forty years of age, and to be possessed of the income and other qualifications defined in the electoral law.

"Art. 18. All Spaniards possessing these qualifications may be proposed for the office of senator in any of the provinces of the monarchy.

"Art. 19. Each time that there is a general election of deputies whether in consequence of their term of office having expired, or of dissolution of the congress, the third part of the senate, in order of seniority, is to be renewed, those going out being re-eligible.

"Art. 20. The sons of the king and the first-born of his heir to the throne are senators of right at the age of twenty-five years.

#### "Of the Congress of Deputies.

"Art. 21. Each province shall appoint one deputy at least for every 50,000 souls of the population.

"Art. 22. The deputies are elected by the direct method, and may be re-elected indefinitely.

"Art. 23. To be a deputy it is necessary to be a Spaniard, in the secular state, to have completed the 25th year, and to possess all the other qualifications prescribed by the electoral law.

"Art. 24. Every Spaniard possessing these qualifications may be named a deputy for any of the provinces.

"Art. 25. The deputies shall be appointed for three years.

#### "Of the Meeting and Faculties of the Cortes.

"Art. 26. The Cortes are to assemble each year. It is the right of the king to convocate them, to suspend and close their meetings, and dissolve the Cortes; but under the obligation, in the latter case, of convoking and re-assembling another Cortes within the period of three months.

"Art. 27. If the king should omit to convocate the Cortes on the 1st of December in any one year, the Cortes are notwithstanding to assemble precisely on that day; and in case of the conclusion of the term of the congress holding office happening to occur in that year, a general election for the nomination of deputies is to commence on the first Sunday of the month of October.

"Art. 28. On the demise of the crown, or on the king being incapacitated to govern through any cause, the extraordinary Cortes are immediately to assemble.

"Art. 29. Each of the co-legislative bodies is to form rules for its own internal regulation, and to scrutinise the legality of the election, and the qualifications of the individuals who compose them.

"Art. 30. The congress of the deputies is to name its president, vice-president, and secretaries.

"Art. 31. In each legislature the king shall appoint from amongst the members of the senate the president and vice-president of that body, the latter appointing its own secretaries.

"Art. 32. The king shall open and conclude the sittings of the Cortes in person, or by his ministers.

"Art. 33. One of the legislative bodies cannot be convoked for business without the other being assembled at the same time, except in the case in which the senate sits in judgment on the king's ministers.

"Art. 34. The legislative bodies are not to deliberate in conjunction, nor in the presence of the king.

"Art. 35. The sessions of the senate and of the congress shall be public, and only in cases requiring reserve can private sittings be held.

"Art. 36. The king and each of the co-legislative bodies possess the right of originating laws.

"Art. 37. Laws relating to taxes and public credit shall be presented first to the congress of deputies; and if altered in the senate contrary to the form in which they have been approved by the congress, they are to receive the royal sanction in the form definitely decided on by the Cortes.

"Art. 38. The resolutions of each of the legislative bodies are to be determined by an absolute plurality of votes; but in the enactment of laws the presence of more than half the number of each of these bodies is necessary.

"Art. 39. If one of the co-legislative bodies should reject any project of law submitted to them, or if the king should refuse it his sanction, such project of law is not to be submitted anew in that legislature.

"Art. 40. Besides the legislative powers which the Cortes exercise in conjunction with the king, the following faculties belong to them:—First, to receive from the king, the immediate successor to the throne, or the regent or regency of the empire, the oath to observe the constitution and the laws. Second, to resolve any doubt that may arise of fact or of right with respect to the order of succession to the throne. Third, to elect the regent, or appoint the regency of the empire, or to choose the tutor of the crown, while a minor, when the constitution deems it necessary. Fourth, to render effective the responsibility from the ministers of the crown, who are to be impeached by the deputies, and judged by the senators.

"Art. 41. The senators and deputies are irresponsible and inviolable for opinions expressed and votes given by them in the discharge of their duties.

"Art. 42. Senators and deputies are not to be proceeded against or arrested during the sessions without the permission of the legislative body to which they may belong, if not taken in the act of committing flagrant crime; but in this case, and in those in which they are prosecuted or arrested whilst the Cortes are closed, they are to give immediate information to their respective co-legislative bodies for their cognizance.

"Art. 43. Deputies and senators who receive from the government or from the royal family pension, employment which may not be an impediment to their duties, or from the government of the same kind, commission with salary, honours or titles, are subject to reelection.

#### "Of the King.

"Art. 44. The person of the king is sacred and inviolable, and is not subject to responsibility. His ministers are responsible.

"Art. 45. The power of executing the laws resides in the king, and his authority extends to all matters which conduce to the preservation of the order in the interior, and to the security of the state abroad, in conformity with the provisions of the constitution and the laws.

"Art. 46. The king sanctions and promulgates the laws.

"Art. 47. Besides the prerogatives granted to the crown by the constitution, he possesses the following:—1. To issue decrees, regulations, and instructions, which may be conducive to the execution of the laws.—2. To provide that justice be promptly and efficaciously administered.—3. To pardon criminals, and to commute the sentences of the law.—4. To declare war and make peace, afterwards giving an account and documents to the Cortes.—5. To dispose of the military forces of the country, distributing them as may be most convenient.—6. To conduct diplomatic and commercial relations with other states.—7. To provide for the coinage of money, which is to be impressed by his hand and name.—8. To decree the application of the funds destined for each branch of the public administration.—9. To appoint public officers, and to confer honours and distinctions on all classes, in conformity with the law.—10. To name and dismiss his ministers without restriction.

"Art. 48. The king is obliged to be authorised by a special law:—1. To alienate, to grant, or exchange any part of the Spanish territory.—2. To admit foreign troops into the kingdom.—3. For the

the treaties of offensive alliance, of special treaties of commerce, and those which stipulate to give assistance to any foreign power.—4. To absent himself from the kingdom.—5. To contract matrimony, and to permit those who may be called to the throne to enter into that state.—6. To abdicate the throne in favour of his immediate successor.

Art. 49. The income of the king and royal family is to be settled by the Cortes at the commencement of each reign.

*"Of the Succession to the Crown."*

Art. 50. Donna Isabel II. de Borbon is the legitimate Queen of Spain.

Art. 51. The succession to the throne of Spain shall be in the regular order of primogeniture and representation, always preferring the anterior to the posterior line of succession; in the same line also preferring the nearer degree of kindred the more remote; in the same degree, the male to the female line of descent; and in the same sex, the eldest to the younger branches of the family.

Art. 52. The line of the descendants of Donna Isabel II. de Borbon becoming extinct, her sister and her uncles by the father's side, male as well as female, and their legitimate descendants, shall succeed, if not excluded specially by law.

Art. 53. If the line of succession pointed out become extinct, the Cortes shall name the sovereign as may be best for the interests of the nation.

Art. 54. The Cortes shall exclude from the succession such persons as are incompetent to govern, or who have done any thing which should cause them to deserve forfeiting their rights to the throne.

Art. 55. During the reign of a female her husband is to take no part whatever in the government of the kingdom.

*"Of the Minority of the Sovereign, and of the Regency."*

Art. 56. The sovereign is to be considered a minor until he is fourteen years of age.

Art. 57. When the king is incapacitated from exercising his functions, or the crown is vacant in consequence of the minority of the immediate successor, the Cortes shall appoint a regency for the government of the kingdom, consisting of three, or five persons.

Art. 58. Until the Cortes shall appoint the regency, the kingdom shall be governed provisionally by the father or mother of the king, and in their absence by a council of the ministers.

Art. 59. The names and surnames of all the functions of royalty, in whose name shall be published all the acts of the government.

Art. 60. The guardian of the king, while a minor, shall be the person appointed in the will of the deceased sovereign, always providing that such guardian shall be a married man; if the deceased king should not have appointed such guardian of the successor, a minor, to the throne, then the father or mother, being in the state of widowhood, shall be the guardian. In the absence thereof, the Cortes shall appoint; but the offices of guardian and regent cannot be discharged by the same individual, except in the case of a father or mother.

*"Of the Ministers."*

Art. 61. All commands or dispositions issued by the sovereign shall be signed by the respective ministers; and no public functionary is to execute such orders if not thus signed.

Art. 62. The ministers may be senators or deputies, and take part in the discussions of the two legislative bodies; but they are permitted to vote in that body only to which they belong.

*"Of the Judicial Power."*

Art. 63. To the tribunals and judges alone belong the power to apply the laws in civil and criminal cases, and without exercising any but the functions of judges and of ministers of justice.

Art. 64. The laws are to determine the nature of the tribunals and judgments which are to exist, the organisation of each, its faculties, the mode of proceeding, and the qualifications of the officers belonging to them.

Art. 65. Judgments in criminal cases to be public, and in the form prescribed by the laws.

Art. 66. No magistrate or judge can be deposed, for a shorter or longer period, except by a written sentence, nor suspended from the discharge of the duties of his office, except by a judicial act, or in consequence of the order of the king, after he, on sufficient grounds, commands him to be tried by a proper tribunal.

Art. 67. Judges are personally responsible for all infractions of the law committed by them.

Art. 68. Justice is to be administered in the name of the king.

*"Of the Provincial Deputations and Corporations."*

Art. 69. In each province there shall be a provincial deputation, composed of a number of persons specified by law, and appointed by the same electors who return the deputies to Cortes.

Art. 70. For the internal government of towns a corporation shall exist in each, to be elected by the inhabitants to whom this right pertains by law.

Art. 71. The law shall determine the organisation and duties of the provincial deputations and the corporations.

*"Of Taxes."*

Art. 72. Each year the government shall submit an estimate of the expenses of the state for the following year, and a schedule of the contributions and of the means of raising them; and in like manner the accounts of the collection and disbursement of the public revenues, for the examination and approval of the Cortes.

Art. 73. No tax or contribution is to be imposed or collected which has not been authorized by the law of the estimates or other special authority.

Art. 74. A similar authorisation is necessary to dispose of the property of the state, and for raising money by loans on the public credit.

Art. 75. The public debt shall be under the special protection of the nation.

*"Of the National Military Forces."*

Art. 76. The Cortes, at the proposition of the king, shall each year determine the number of the permanent military forces by sea and land.

Art. 77. In each province there shall be corps of national militia, whose organisation and duties are to be defined by a particular law; and in case of necessity, dispose of these forces within the respective provinces, but not out of them without the express authorisation of the Cortes.

*"ADDITIONAL ARTICLES."*

Art. 1. The laws shall define the time and manner in which judgments by juries for every class of offences are to be established.

Art. 2. The provinces beyond the seas shall be governed by special laws.

The business of the Spanish government is carried on under the Regent (at present, 1842, General Espartero, Duque de Victoria), by ministers of the interior, foreign affairs, war, marine, and finance. The kingdom is now, as already seen, divided into 47 provinces, exclusive of the Balearic and Canary Islands. The constitution declares that a provincial deputation, or cortes, shall be elected in every province, for the superintendence of its internal affairs; and that corporations are to be established in the different towns. Such corporations have, indeed, long existed in Spain; and every *pueblo* in the kingdom, great and small, has, for a long series of years, had its *ayuntamiento*, or corporation, which manages the common property (often very large) of the pueblo; applies and levies the taxes required for public and private purposes, &c.; and otherwise enjoys considerable power and influence.

The laws of Spain, previously to the late revolution, and the greater number of those now in force, are embodied in the codes known by the titles of *Fuero Juzgo*, *Leyes de las Siete Partidas*, *Ordenamiento Real*, *Fuero Real*, and *Novissimo Recopilacion*. The first of these is, in the main, an abridgment of the Theodosian code, originally published by Alaric, son of Euric, one of the Gothic conquerors of the Peninsula, and successively augmented by the addition of new laws. The *Ordenamiento Real* contains the code of laws established by Ferdinand and Isabella. The *Leyes de las Siete Partidas* is a compound of Gothic, Roman, and canon law. The *Fuero Real* is a mixture of Roman and Gothic law) was compiled at Utrera in 1298, for the use of the kingdom of Aragon; and the *Novissimo Recopilacion* is a digested collection of edicts issued by the kings of Spain, and enjoys the highest authority. It cannot be surprising that, with so many different and often conflicting codes, the general system of jurisprudence should be extremely defective. But the administration of the laws is incomparably worse than the laws themselves, being slow, complicated, and protracted to a ruinous degree. There are endless appeals from one jurisdiction to another, and the whole machinery of the courts is adapted to screen the venality of the judges, and to afford a rich harvest to the *escribanos*, or attorneys, the only medium of communication between the client and the judge. Justice of no kind has any existence; there is the most lamentable insecurity of person and property; redress is never certain, because both judgment and execution of the laws are left to men so inadequately paid, that they must depend for their subsistence upon bribery. Nothing is so difficult as to bring a man to trial who has any thing in his purse, except to bring him to execution; this, indeed, is in most parts impossible, as money will always buy indemnity. Every thing in Spain connected with the following out the laws is in the hands of the *escribanos*: these are the friends of all bad men; for, whatever be the action a man may commit or meditate, he has only to confide in the *escribano*, and pay for his protection." (*Anglia's Spain* in 1830, i. 251.)

The wretched defects in the administration of justice were, in some degree, obviated, in so far, at least, as petty cases were concerned, by the adoption of a sort of arbitration system. Individuals, called *alcaldes*, annually chosen, according to the different privileges of the different towns, boroughs, and villages in which they reside, decide the cases brought before them, like Sancho Panza in the island of Barataria, according to their own sense of what is right and equitable. But, with the exception of this rude and defective tribunal, every other part of the Spanish judicial system is a tissue of the most scandalous abuses. There is, in fact, but little security for property, and still less for life.

A person robbed or assaulted may prosecute, but, if unsuccessful, is bound to pay all the expenses; and is, indeed, forced to lodge a sum of money with the *alcalde pedáneo* (sheriff's officer), before any steps be taken in the business. In cases of murder and assassination, the last of which is horribly frequent, witnesses are afraid to come forward, as it very frequently happens that they are imprisoned until they establish their innocence. But even when, braving all these dangers, individuals boldly denounce a crime, there are at least five chances to one that the culprit escapes from prison, or compounds his felony with the judges; and in that case, the accusers have everything to dread from the vengeance of the criminal. The banditti are numerous and powerful; not only overawing those among whom they live, but keeping all the petty officers in their pay; so that they are enabled to prosecute their murderous career with comparative impunity. Even when a robber or assassin has been convicted and sentenced, there is no certainty that punishment will follow. Thus, from execrable laws, still more execrably administered, it is commonly said in Spain, that not one crime in ten is ever brought before the courts; and, though this be probably overstated, if we take the proportion at one in four or five, we shall certainly be within the mark.

Under such circumstances, need we wonder at the dreadful frequency of the most atrocious crimes?

*Language, Literature, and Education.*—It seems probable that the Cantabrian was the most ancient language of Spain, of which remnants are supposed by some still to exist in the modern Basque, spoken by the Biscayans and other inhabs. of the districts bordering on the Pyrenees. The old language of the Peninsula must, no doubt, have been considerably alloyed by the admixture of Phœnician words and phrases during the Carthaginian dominion; and when the Romans conquered Spain, they introduced their language, which, for several centuries, was the principal medium of communication of all except those living in the most remote districts. The Visigoths, who followed the Romans in the possession of the peninsula, introduced the *lingua Romana*, a mixture of the Latin and German languages; but the Latin, though corrupt, still continued to be spoken in many parts. Again, when the Moors overran the country, expelled the Visigoths, and established their own power, they brought with them the Arabic language, already highly cultivated, and well adapted for poetry; and this, in turn, became the general language of the country. Thus, out of numerous elements was gradually formed a new language—the Spanish; and though numerous dialects necessarily arose in the different petty kingdoms into which the country was split, that of Castile became at length the classical language of Spain. Its basis is Latin; and many of the ancient inflexions, as well as words, are still preserved. There are also a large number of Teutonic words; but the admixture of Arabic, though very considerable, is less than in the Portuguese. Force of expression, depth of sound, and mellifluous cadence, are the peculiar characteristics of the Spanish; which, however, has a guttural accent, derived probably from its Teutonic origin. The abundance of vowels and liquids makes the language harmonious, when spoken by native Castilians: it is essentially poetical, and poetry may be considered as the germ of the national literature. It is a curious fact, that there is very little *patois* among the Castilians, and that the language is spoken by the lower classes with remarkable purity and precision.

The rise of Spanish literature cannot be traced further back than the middle of the 12th century, for the songs of the Troubadours belong to a period antecedent to the settlement of the language. The ballads composed in honour of Rodrigo Díaz de Vivar, called *el Campeador*, or more popularly the *Cid*, are among the earliest specimens of Spanish writing, and display at once great independence of thought, and felicity of expression. No doubt, however, the Moorish ballads, or those written to celebrate the chivalrous contests between Christian and Moslem knights, that preceded and accompanied the fall of Granada, form the most striking and distinctive part of the national literature of Spain. "The Moorish wars had always afforded abundant themes of interest to the Castilian muse; but it was not till the fall of the capital that the very fountains of song were broken up, and those beautiful ballads were produced which seem like the rays of departed glory lingering round the ruins of Granada. They present a most remarkable combination of, not merely the exterior form, but the noble spirit, of European chivalry, with the gorgeousness and offensive luxury of the East. They are brief, seizing single situations of the highest poetic interest, and striking the eye of the reader with a brilliancy of execution, so artless in appearance as to seem rather the effect of accident than study. We are transported to the gay seat of Moorish power, and witness the animating bustle, its pomp, and its revelry, prolonged to the last hour of its existence." (*Prescott's Ferdinand and Isabella*, li. 290.) But it was, perhaps, hardly necessary to say so much about the Spanish ballads, as the admirable translations of Mr. Lockhart have made their spirit, at least, familiar to most readers.

The honour of being the first to introduce regular dramatic writing into Spain has been ascribed to Torres de Naharro, in the early part of the 16th century. He was followed by Lopez de Vega, born at Madrid in 1562, at once the most original, most unequal, and most voluminous of the Peninsular dramatists. Calderon, born in 1600, carried the Spanish drama to its highest perfection. Like his great precursor, Lopez de Vega, his plays are most unequal, the finest scenes being mixed up with the most revolting barbarism and extravagance. The astonishing fecundity of these writers may in some degree account for, though it cannot excuse, the defects and inconsistencies in their dramas. The published works (which do not, however, embrace nearly all his pieces) of Lopez de Vega consist of 25 vols. 4to., each containing 10 or 12 plays; and 127 dramas are ascribed to Calderon, besides a still greater number of vaudevilles, interludes, &c. The Spanish drama, however, has long fallen into decay. The humiliation of the country during the disastrous reigns of Philip IV. and Charles II., and the deadening influence of the Inquisition, were little favourable

to its culture; and after the accession of the Bourbon dynasty to the throne, French criticism and taste obtained an ascendancy, while the troubles in which Spain has been more recently involved have stifled all poetical talent. Some endeavours, indeed, have been made to revive the national drama; but they have signally failed, and no modern name connected with this branch of literature deserves notice, except perhaps that of Martinez de la Rosa, the author of the *Viuda de Padilla*.

The *Araucana* of Ercilla, born in 1525, is the only poem that Spain has produced that has any pretensions to be classed among epics.

Chivalrous romance was early and assiduously cultivated in Spain. Happily, however, the inimitable satire of Cervantes destroyed at once and for ever the whole race of knights errant. His *Don Quixote*, however, still continues to interest all classes of readers by its exhaustless wit, the truth of its delineations, and its practical good sense. It has been rendered into almost all languages; and, how defective soever the translation, it never fails to amuse and instruct.

But, with the exception of this unique and admirable work, Spanish works are but little known in foreign countries; and in most departments, indeed, the literature of Spain is poor in the extreme. And how could it be otherwise? In 1502 the censorship of the press was established; and the power of carrying it into effect was very soon entrusted to the Inquisition. "*Il s'est établi dans Madrid*," says Beaumarchais, with quite as much of truth as of wit, "*un système de liberté sur la vente des productions, qui s'étend même à celles de la presse; et que, pourvu que je ne parle en mes écrits ni de l'autorité, ni de culte, ni de la politique, ni de la morale, ni des gens en place, ni des corps en crédit, ni de l'Opéra, ni des autres spectacles, ni de personne qui tienne à quelque chose, je puis tout imprimer librement, sous l'inspection de deux ou trois censeurs*." (*Marriage de Figaro*, acte v.) Under such circumstances, it would be contradictory and absurd to expect that the Spanish writers should have distinguished themselves in philosophical research, original discussion, or in any pursuit requiring freedom of inquiry. Spain has a few respectable, but no great or eminent, authors.

Even so late as 1830, a respectable and, which is more singular, an intelligent priest stated to Mr. Inglis, that nothing was so difficult as to obtain a license to publish a book, even though it contained no allusion to politics; and the better the book," said he, "the more difficult it is to obtain a license, and the more dangerous to publish; because government does not wish to encourage writing or even thinking upon any subject; and the publication of a good book sets men a-thinking." (*Inglis*, i. 213.)

Since 1830, however, a great change for the better has taken place; the censorship of the press has been suppressed, and the influence and authority of the clergy greatly diminished. Hopes may, therefore, be reasonably entertained that literature will again revive; but no sudden development of the mental resources of the nation need be expected, and many years must elapse before literature acquire any material influence.

It would be to no purpose to take up the reader's time by entering into any lengthened details with respect to the state of education in Spain. It has been wholly in the hands of the clergy and the Inquisition; and, instead of contributing to expand and enlighten the mind, it has been so contrived as to pervert every sound principle, and imbue it with the grossest and most unworthy prejudices. The education of the Spaniards has been, in fact, the complement of their religion; and, like it, has been fitted and intended to enslave and debase the people, and to make them believe that it was alike their duty and their interest to submit without murmur and without inquiry, to whatever their temporal and spiritual rulers might direct. Nothing, of course, like moral or political philosophy was taught in any seminary of Spain; there was even but little progress made in the study of the learned languages, and science was in the most abject state. A thorough reform of the educational establishments of the country is indispensable; and it were better, indeed, that they should be wholly shut up than that they should continue on any thing like their ancient footing. Efforts have been already made to introduce an improved system of elementary instruction; but, unfortunately, it has been necessary, from the want of other qualified parties, to intrust the superintendence and management of the schools to the parochial clergy; and they, speaking generally, are decidedly hostile to the new order of things, which they not unnaturally regard as in the last degree inimical to their power and interests.

*Taxes.*—The taxation of Spain has been quite in harmony with her institutions, and, like them, seems to have been intended to obstruct as much good, and inflict as much evil on the country, as possible. Probably, indeed, the *alcabala* is the most objectionable tax that has

ever been imposed. It originated in 1341, and consisted at first of 10, increased, in 1642-1664, to 14 per cent, *ad valorem*, charged on all commodities, whether raw or manufactured, as often as they were sold, and rated always according to the selling price! Such a monstrous impost was of itself sufficient to annihilate industry. It effectually hindered manufactures from making any progress in Castile and the other provinces subject to its destructive influence. And Ustariz, Ulloa, and Campomanes, Spanish authors of the highest credit, agree in opinion with Mr. Townsend, that it is to their exemption from this odious tax that the comparatively flourishing state of industry in Catalonia and Valencia is mostly to be ascribed.

The alcabala, however, no longer exists in its original form; but, even in its amended shape, it is in the last degree objectionable. It is now converted into local duties, or octrois (*derechos de puertas*), paid on bringing products within towns and villages.

In some instances the rate of duty has been diminished, but in the larger number it has been greatly increased. The same duties are not imposed in different towns; almost every one having a peculiar rate for itself. In general it is fixed by the *ayuntamiento*, or council of the town. Most foreign manufactured goods pay about 30 per cent, *ad valorem*, some as much as 60 per cent, exclusive of the customs duties charged at the frontier. Wine pays a duty which in many places is equal to 100 per cent, upon its value; and oil from 60 to 75 per cent. The duties press severely on every class, but chiefly on the poor, and are the subject of universal complaint. The *ayuntamiento* receives a certain per centage upon the amount collected at the gate of the town for local objects; the rest goes to the public treasury. In small villages it is levied only on necessities, as meat, fowls, eggs, oil, corn, &c.

In towns which are not walled, or have no gates, a tax called the *equivalente* is levied, that is, the inhabs. are assessed in such a sum as the alcabala would probably produce, calculating from the revenue afforded by other towns of the same size. The alcade and *ayuntamiento* are responsible for its payment, and they divide the sum very arbitrarily amongst the householders, according to their estimate (influenced, of course, by every sort of partiality) of the products each ought to consume.

Next to the alcabala, tithe is the most oppressive tax in Spain, and the most complained of. Formerly it was exacted with the greatest rigour, and from articles (amongst others, from *las malas mugeres, de lo que ganan con su cuerpo*—Ley de Partida, 3d tit. 20, part 2.), which might have been considered beyond the reach of even clerical rapacity. Arguilez estimated the value of the tithe at 600 millions of reals; and, according to official documents, it amounted, in 1808, to 620 millions. In 1820, however, it was estimated, by a commission appointed to inquire into the subject, at only 335,694,000 reals; but it is believed that this estimate was as much below the truth as the former was probably above it. The clergy, however, did at no time receive the whole of this immense income; and, in consequence of the events of the last few years, but a very small portion of it now finds its way into their coffers.

Among other taxes are the *Frutos civiles*, six per cent. on the produce of all rented lands; but this has recently been converted into a direct tax on land, trade, and manufactures; *Medias Anatas*, being the first half year's rent of all entailed lands on the accession of the heir; *Lanzas*, a composition tax in lieu of the troops which the nobles and mayordomos were formerly bound to furnish; *Subsidio del comercio*, a tax of 100,000*l.* levied upon the merchants. The finance minister fixes the proportion which each *financiera* must pay. The intendents then fix the proportion payable by each town; and the *ayuntamientos* assess the individuals. It is so unequally divided, that merchants of the first class pay 40*l.* In some towns, and only 20*l.* in others. It is generally believed that the amount really levied, under pretence of this tax, is double the nominal amount; there being no means of checking the misconduct of the officers. There are, also, taxes on houses, on patents, bull-fights, the lottery, &c.; with the enormous customs duties already referred to.

The bulk of the taxes were formerly divided into two great classes, and the division is not yet wholly abandoned,—the *rentas generales* and the *rentas provinciales*. The former are collected throughout all Spain, with the exception of Biscay. They include the revenue derived from the post-office, the stamp duties, customs, &c., together with the royal monopolies of salt, tobacco, and gunpowder. The *rentas provinciales* are collected only in the provinces belonging to the crown of Castile, and do not, therefore, affect Biscay, Navarre, Catalonia, Aragon, or Valencia, which have peculiar and less burdensome taxes.

The tax denominated *paja y utensilio* is appropriated to the support of the army. Previously to the reign of

Philip V., the inhabs. of the different provinces in which the troops were quartered, were obliged to furnish them gratuitously with various articles of subsistence. But, in 1719, this was changed into a money contribution, at certain specified rates for officers and men. Nothing, however, can be more unjust and unequal than this tax, for it imposes a heavy burden on the places where troops are stationed, from which other parts of the country, though perhaps richer, are entirely exempted.

The revenue derived from the tobacco and salt monopolies is very considerable. Every one may buy any quantity of tobacco he chooses, provided he buy it in the government *estancos*; but salt is the subject of assessment. The intendents fix the consumption which should take place in every town under his charge, and the total quantities are delivered to the alcaides, who fix the specific quantity for which each individual must pay, whether he use it or not. The land-owners, farmers, &c. are charged with a quantity proportioned to the number of individuals in their employment, and of the cattle and sheep which they possess.

The provinces of Navarre and Biscay, and some others, purchase by an annual contribution, which does not amount to above 150,000*l.*, an exemption from a number of petty taxes. The *crusado*, or bull granting permission to eat meat on Fridays, and four days every week during Lent, is in general demand all over the kingdom, and is supposed to yield from 300,000*l.* to 800,000*l.*

Such is a rough outline of the taxation, that has existed in Spain down to a very recent period, but which, it is highly probable, will now undergo very essential modifications, particularly the customs duties, which are of themselves sufficient to retain the country in the barbarism into which it has been plunged. We are unable to lay before the reader any authentic account of the revenue of Spain, but its gross amount may, perhaps, be estimated at about 850 millions reals, or 9,400,000*l.* sterling. This, however, is little better than a guess; for no really trustworthy account of the revenue of Spain has been, nor, we believe, could be, published for these many years back. The *ayuntamientos* of the different *pueblos*, into which the kingdom is divided, are mostly disinclined to render a fair account of their proceedings; and as they have great influence, a lengthened period will probably elapse, supposing the present government to maintain its footing, before any accurate account of the different items of revenue be made public. In the meantime it is abundantly notorious that the expenses of Spain very much exceed her income; and that she is, at this moment, wholly without the means of meeting her engagements. According to some recent semi-official statements, the total debt of Spain amounted, in October, 1841, to 14,160,968,047 reals, or 157,344,080*l.*, of which sum the internal debt amounted to 8,318,988,279 reals, and the external debt of every description, to 5,841,982,768 reals, or to very near 65,000,000*l.* A large amount of this debt is due to the English; and the interest on it has not been paid for a lengthened period.

Bad, however, as is the condition of Spain in a financial point of view, it is not desperate. The bankrupt state in which we find her is the fruit of centuries of despotism and vicious legislation, and of lengthened civil contests. But a liberal government has been organised; and, provided it be able to maintain itself, the institutions that have entailed so much ruin on the country will gradually be amended, and her vast resources, and the talents of her people, be again developed.

The present government of Spain has manifested a laudable anxiety to make good the engagements of the country; and, if it be not overthrown, the fair presumption seems to be that it will effect its object. The value of the unsold national property belonging to the state was estimated by Señor Mendizábal, on the 22d of May, 1840, at nearly 96,000,000*l.*, and as sales were effected in the course of the following year to the extent of about 16,500,000*l.*, its value may now (Dec. 1841) amount to about 79,500,000*l.*\*; the whole of which is, according to existing arrangements, to be applied to the payment of the public debt. We are aware that these statements are not entitled to any great degree of confidence, partly from the difficulty of obtaining any accurate account of the public property, and partly from the degree in which its value is liable to be affected by the supposed stability of the government, the quantity of property thrown upon the market, the conditions of sale, &c. On the whole, however, the estimate now referred to would seem to be moderate. And, supposing that the government maintains itself, and is able to carry into effect the liberal policy to which it has given its sanction, the regeneration of Spanish finance and of the kingdom will be secured. A thorough reform of the customs laws would alone put 300,000,000 of reals, or above 3,000,000*l.* sterling, a year into the public treasury, exclusive of the other and still more important advantages that would result from it.

\* Spain in 1841, by a Committee of Bondholders, p. 24.

**Army.**—The regular army may amount to about 60,000 men; and there is, besides, an extensively organized militia. But, though abstemious, brave, and patient under fatigue and privations, the Spaniard wants that steady perseverance and intrepidity essential to the military character. The troops are, also, for the most part, badly disciplined, badly appointed, and will not bear to be compared, in any respect, with those of England, France, Germany, or Russia. The cavalry are particularly ill equipped; and the engineering department is such as might be expected from the state of science in the country. But, how deficient soever, the troops are, at all events, superior to the officers; and it is a curious and not easily explained fact, that, during the whole of the late war with France, not a single individual attained to distinction as a commander, or evinced any superior ability in the art of war or in the conduct of considerable masses. Some of them were good guerilla leaders, but nothing more.

The Spanish navy, once so formidable, is now sunk to a state of almost total decay.

**Races, Character, &c.**—There are four distinct races in Spain: 1st, the Spaniards, who form the bulk of the population; 2dly, the *Basques* (about 500,000), descended from the ancient Cantabrians, and living in Navarre and the Basque Provinces; 3dly, the *Morescos*, descendants of the Moors, about 60,000 of whom still reside in Granada and the Alpujarras; and, lastly, the *Gitanos*, or gypsies, a race (comprising about 50,000) spread all over the Peninsula, but especially on the S.E. coasts; not strolling from place to place, as in England, but generally pursuing fixed occupations in the towns.\* The Spaniards are middle-sized, thin, with well-proportioned limbs, dark hair, black piercing eyes, overshadowed by thick eyebrows, sharp features, and sallow complexions. The women are generally of middle or low stature, but gracefully formed, with almost aquiline noses, full, dark, expressive eyes, dark hair, and complexions varying from the flesh tint of N. Europe to the light olive of the Moors.

The character of the Spaniards has been very variously drawn; but, though it differs materially in different provinces, its discriminating features are not to be mistaken. Though commonly slow, cautious, and deliberate, they become, when their passions are roused, rash, violent, and precipitate in the extreme. Though formal, they are courteous in their bearing, and, though grave, polite. The pride of the Spaniards is proverbial, and they entertain the most overweening opinion of themselves and their country. Though friendly, they are easily offended, vindictive, and more inclined to revenge real or fancied insults than to remember favours. They are fond to excess of show and ostentation; and will endure the greatest privations at home to make a display in public. Their vicious institutions and their climate have made them in the last degree indolent and procrastinating. They are infinitely less jealous now than formerly; and their bigotry has become passive rather than active. They have ceased, in fact, to care much about religion; and are satisfied if they observe the fasts and unmeaning mummeries which it enjoins. Their ignorance often makes them attached to what is most ruinous to themselves; and those who think to gain their favour by denouncing some flagrant abuse, frequently find, to their surprise, that it is the object of popular attachment. They are temperate in eating and drinking, though it may be doubted whether this be not more the consequence of necessity than of choice. Morals are, speaking generally, even more corrupt in Spain than in Italy; and Mr. Townsend mentions, that at the period of his visit, in 1790, the priests divided with the officers the duty of *cortijos* to the ladies!

We subjoin, from the works of two of the most intelligent Englishmen who have ever visited Spain, Mr. Swinburne and Colonel Napier, author of the classical work on the *Peninsular War*, the following notices of the Spanish character:—

"The listless indolence, equally dear to the uncivilized savage and to the degenerated slave of despotism, is no where more indulged than in Spain; thousands of men in all parts of the realm are seen to pass their whole day wrapped up in a cloak, standing in rows against a wall, or dozing under a tree. In total want of every excitement to action, the springs of intellectual faculties forget to play, their views grow confined within the wretched sphere of mere existence, and they scarce seem to hope or foresee any thing better than their present state of vegetation; they feel little or no concern for the welfare or glory of a country, where the surface of the earth is engrossed by a few overgrown families, who seldom bestow a thought on the condition of their vassals. The poor Spaniard does not work, unless urged by irresistible want, because he perceives no advantage accrue from industry. As his food and raiment are purchased

at a small expense, he spends no more time in labour than is absolutely necessary for securing the scanty provision his abstemiousness requires. I have heard a peasant refuse to run an errand, because he had that morning earned as much already as would last him the day without putting himself to any further trouble. Yet I am convinced that this laziness is not essentially inherent in the Spanish composition, for it is impossible without seeing them to conceive with what eagerness they pursue any favourite scheme, with what violence their passions work upon them, and what vigour and exertion of powers they display when awakened by a bull-fest, or the more constant agitation of gaming,—a vice to which they are superlatively addicted. Were it again possible, by an intelligent spirited administration, to set before their eyes, in a clear and forcible manner, proper incitements to activity and industry, the Spaniards might yet be roused from their lethargy and led to riches and reputation; but I confess the task is so difficult that I look upon it rather as an Utopian idea than as a revolution ever likely to take place.

"Their soldiers are brave and patient of hardships; wherever their officers lead them, they will follow without flinching, though it be up to the mouth of a battery of cannon; but unless the example be given them by their commander, not a step will they advance. Most of the Spaniards are hardy, and, when once engaged, go through difficulties without murmuring, bear the inclemencies of the season with firmness, and support fatigue with amazing perseverance. They sleep every night in their cloaks on the ground, are sparing in diet, perhaps more from a sense of habitual indigence than from any aversion to gluttony; whenever they can riot in the plenty of another man's table, they will gormandise to excess, and, not content with eating their fill, will carry off whatever they can stuff into their pockets. I have more than once been a witness to the pillage of a supper by the numerous beaux and admirers which the ladies lead after them in triumph wherever they are invited. They are fond of spices, and scarce eat any thing without saffron, pimiento, or garlic; they delight in wine that tastes strong of the pitched skin, and of oil that has a rank smell and taste; indeed, the same oil feeds their lamp, swims in their potage, and dresses their salad; in thus the lighted lamp is often handed down to the table, that each man may take the quantity he chooses. Much tobacco is used by them in smoking and chewing. All these hot dry kinds of food, co-operating with the parching qualities of the atmosphere, are assigned as causes of the spare make of the common people in Spain, where the priests and the lunkeepers are almost the only well-fed portly figures to be met with.

"The Spanish is by no means a naturally serious melancholy nation: misery and discontent have cast a gloom over them, increased, no doubt, by the long habit of distrust and terror inspired by the Inquisition; yet every village still resounds with the music of voices and guitars; and their fairs and Sunday wakes are remarkably noisy and riotous. They talk louder and argue with more vehemence than even the French or Italians, and gesticulate with equal if not superior eagerness. In Catalonia the young men are expert at ball; and every village has its *pelota*, or ground for playing at five; but in the south of Spain I never perceived that the inhabitants used any particular exercise. I am told that in the island of Majorca they still wield the sling, for which their ancestors, the Balcares, were so much renowned.

"Like most people of southern climates, they are dirty in their persons, and overrun with vermin." (*Travels*, ii. 196.)

"The Spanish character," says Colonel Napier, "is distinguished by inordinate pride and arrogance. Dilatory and improvident, the individual as well as the mass, all possess an absurd confidence that every thing is practicable which their heated imaginations suggest; once excited, they can see no difficulty in the execution of a project, and the obstacles they encounter are attributed to treachery. Kind and warm in his attachments, but bitter in his anger, the Spaniard is patient under privations, firm in bodily suffering, prone to sudden passion, vindictive, bloody, remembers insult longer than injury, and craves in his revenge. There is not upon the face of the earth a people so attractive in the friendly intercourse of society. Their majestic language, fine persons, and becoming dress, their lively imagination, the inexpressible beauty of their women, and the air of romance which they throw over every action, and infuse into every feeling, all combine to delude the senses and impose upon the judgment. As companions, they are, incomparably, the most agreeable of mankind; but danger and disappointment attend the man who, confiding in their promises and energy, ventures upon a difficult enterprise. 'Never do to-day what you can put off till to-morrow,' is the favourite proverb in Spain, and rightly followed." (i. 38, &c.)

In Spain there is a good deal of aristocratic pride,

\* The reader is referred, for a copious account of these singular people, to *Darren's Account of the Gypsies of Spain*, 2 vols., recently published.

and the distinction of ranks is much attended to. The *hidalgos*, or gentry, claim to be descended from those Spaniards who, on the subjugation of the rest of the country by the Moors, found an asylum in the fastnesses of the northern provinces, whence they again gradually spread their conquering arms over the whole country. Besides the *hidalgos de sangre*, or by descent, there are also *hidalgos de privilegio*, or by office, conferred on them by the sovereign; but of these there are comparatively few. According to the official returns, there were in the kingdom, in 1787, 480,589 *hidalgos*, of whom no fewer than 401,040 belonged to the Asturias, Biscay, Burgos, Galicia, and Leon. Many of the *hidalgos* are extremely poor, and they are all intolerably proud.

The *grandes* of Spain, who are the real nobility of the country, are the descendants of those who, in consideration of their eminent services, acquired the privilege of speaking in the Cortes covered in presence of the king! A man may be a *titulado*, that is, he may enjoy the title of duke, marquis, or count, without being noble; and in Spain, in fact, such titles are of little more consequence than that of baronet in this country.

The *hidalgos* formerly enjoyed various privileges; but these have now been very much curtailed. Among others, they could entail lands or establish majorats; these, however, are now abolished.

The *Manners and Customs* of the inhabs. vary greatly in different parts of Spain, and are much influenced by climate. (See articles MADRID and SEVILLE.) The diet of the middle and higher classes consists of chocolate for breakfast, with mutton, beef, and pork, especially the latter, dressed in various ways, and accompanied by cabbage, garbanzos (Spanish beans), onions, and large pease called *chichorus*. The *olla*, or *cocido*, is a favourite dish; and the sausages (*chorizos*) of Castile are said to be about the best in Europe. Wine is used only in small quantities, and the kinds in common use are seldom much stronger than the low-priced wines of France. The *siesta*, or repose during the heat of the day, is customary to all classes throughout Spain. From 1 to 4 o'clock, in Madrid and most other cities, the shops are either shut, or a curtain drawn before the door; the shutters of every window are closed, and scarce a respectable person is to be seen in the street. But the moment the *siesta* is over, all is again instinct with life and bustle. Exercise is usually taken in the evening, when nearly the entire pop. is abroad. *Tertulias*, or evening parties, are very frequent in the great towns. The theatre is little frequented. *Bull-fights*, though discountenanced by government, are in Spain what the circus was in ancient Italy, the national pastime, favourite resort, and chief amusement of all classes. Though by no means entitled to high rank as musicians, the Spaniards have considerable musical taste; and all orders are passionately fond of dancing, the national dances being the *bolero* and *fandango*, the former a graceful easy movement, the latter a dance of frolic and more licentious character, seldom seen in good society.

The lower classes live on wretched fare, rarely eating meat, and fish only occasionally, except on the coast. The farming labourers fare somewhat better, the chief articles of food being bread, soup, garlic, bacon, and *garbanzos*, with the accompaniments of wine and oil. Notwithstanding the suppression of the convents, mendicancy is still exceedingly prevalent; and perhaps the only remedy for this inveterate disease is the abolition of all endowments for paupers, and the establishment of some provision for the poor, as in England. Cloaks and broad-brimmed hats are very generally worn by the men; and the mantilla and fan are in universal use among females.

Mr. Townsend and all other travellers in Spain have given descriptions of bull-fights. We extract the following account from Mr. Inglis's work, not because it is the best, but because it is one of the most recent:—

"The bull-fight is the national game of Spain, and the love of the Spaniards for this spectacle is almost beyond belief. Monday, in Madrid, is always, during the season of the bull-fights, a kind of holiday; every body looks forward to the enjoyment of the afternoon, and all the conversation is about *los toros*. Frequency of repetition makes no difference to the true amateur of the bull-fight; he is never weary of it; at all times he finds leisure and money to dedicate to his favourite pastime.

The spectacle is generally announced, in the name of his majesty, to begin at four o'clock; and, before then, all the avenues leading towards the gate of Alcalá are in commotion; the Calle de Alcalá, in particular, throughout its whole immense extent, is filled with a dense crowd, of all ranks and conditions, pouring towards the gate. A considerable number of carriages are also seen, even the royal carriages; but these arrive later, and there are also many hack cabriolets, their usual burden being a peasant and two girls dressed in their holiday clothes, for there is no way of showing gallantry so much approved, among the lower orders, as *treating* to a bull-fight; and when this is carried so far as to include a

drive in a red and gilded cabriolet, the peasant need sigh no longer.

"I had been able to secure a place in one of the best boxes. The spectacle was most imposing: the whole amphitheatre, said to contain 17,000 persons, was filled in every part, round and round, and from the ground to the ceiling, carrying the imagination back to antiquity, and to the butcheries of a Roman holiday. The arena is about 230 ft. in diameter; this is surrounded by a strong wooden fence, about 6 ft. in height, the upper half rotating about a foot, so as to leave, in the middle of the fence, a stepping-place, by which the men may be able, in time of danger, to throw themselves out of the arena. Behind this fence there is an open space about 9 ft. wide, extending all the way round, meant as a retreat; and where, also, the men in reserve are in waiting, in case their companions should be killed or disabled. Behind this space is another higher and stronger fence, bounding the amphitheatre, for the spectators: from this fence the seats decline backward, rising to the outer wall; and above these there are boxes, which are all roofed, and are, of course, open in front. The best places in the boxes are about 4s.; the best in the amphitheatre below, about 2s. 6d.; the commonest place, next to the arena, costs 4 reals. In the centre of the W. side is the king's box; and, scattered here and there, are the private boxes of the *grandes* and amateurs. In the boxes I saw as many women as men; and in the lower parts the female spectators were also sufficiently numerous: all wore mantillas; and in the lower parts of the amphitheatre, which were exposed to the sun, every spectator, whether man or woman, carried a large circular paper fan, made for the occasion, and sold by men who walk round the arena before the fight begins, raising among the spectators their long poles, with fans suspended, and a little bag fixed here and there, into which the purchaser drops his four quartos (14d.).

"The people now began to show their impatience, and shouts of *¡toros* were heard in a hundred quarters; and soon after a flourish of trumpets and drums announced that the spectacle was about to commence. This created total silence, and the motion of the fans was, for a moment, suspended:—first entered the chief magistrate of the city on horseback, preceded by two alcaides, or constables, and followed by a troop of cavalry, who immediately cleared the arena of every one who had no business there; next, an official entered on foot, who read an ordonnance of the king, commanding the fight, and requiring order to be kept; and these preliminaries having been gone through, the magistrates and cavalry retired, leaving the arena to the two picadors, who entered at the same moment. These are mounted on horseback, each holding a long lance or pike, and are the first antagonists the bull has to encounter; they stand upon the different sides of the area, about 20 yards from the door at which the bull enters; and at a new flourish of trumpets, the gate flew open, and the bull rushed into the arena: this produced a deafening shout, and then total silence. The bulls differ very widely in courage and character: some are rash,—some cool and intrepid,—some wary and cautious,—some cowardly,—some, immediately upon perceiving the horse and his rider, rush upon them; others run bellowing round the arena,—some make towards one or other of the *chulos*, who, at the same moment that the bull appears, leap into the arena with coloured cloaks upon their arms; others stop, after having advanced a little way into the arena, look on every side, and seem uncertain what to do. The blood of the bull is generally first spilt: he almost invariably makes the first attack, advancing at a quick trot upon the picador, who generally receives him upon his pike, wounding him somewhere about the shoulder. Sometimes the bull feeling himself wounded, retires to meditate a different plan of attack; but a good bull is not turned back by a wound,—he presses on upon his enemy, even if, in doing so, the lance be buried deeper in his flesh. Attached to the mane of the bull is a crimson riband, which it is the great object of the picador to seize, that he may present to his mistress this important trophy of his prowess. I have frequently seen the riband torn off at the moment that the bull closed upon the picador.

"The first bull that entered the arena was deficient both in courage and cunning: the second was a fierce bull of Navarre, from which province the best are understood to come: he paused only for a moment after entering the arena, and then instantly rushed upon the nearest picador, who wounded him in the neck; but the bull, disregarding this, thrust his head under the horse's belly, and threw both him and his rider upon the ground: the horse ran a little way, but, encumbered with trappings, he fell; and the bull, disregarding for a moment the fallen picador, pursued the horse, and, pushing at him, broke the girths, and disengaged the animal, which, finding itself at liberty, galloped round the arena, a furious spectacle, covered with gore, and its entrails trailing upon the ground.

The bull now engaged the chulos: these young men show great dexterity, and sometimes considerable courage, in the running fight, or rather play, in which they engage the bull, flapping their cloaks in his face, running zigzag when pressed, and throwing down the garments to arrest his progress a moment, and then vaulting over the fence, an example which is sometimes followed by the disappointed animal. But this kind of warfare the bull of Navarre seemed to consider child's play; and leaving these cloaked antagonists, he made furiously at the other picador, dexterously evading the lance, and burying his horns in the horse's breast: the horse and his rider extricated themselves, and galloped away; but suddenly the horse dropped down, the wound having proved mortal. The bull, victorious over both enemies, stood in the centre of the arena, ready to engage another; but the spectators, anxious to see the prowess of the bull directed against another set of antagonists, expressed their desire by a monotonous clapping of hands and beating of sticks, a demonstration of their will perfectly understood, and always attended to.

"The *banderilleros* then entered: their business is to throw darts into the neck of the bull; and, in order to do this, they are obliged to approach with great caution, and to be ready for a precipitate retreat: because it sometimes happens that the bull, irritated by the dart, disregards the cloak which the *banderillero* throws down to cover his retreat, and closely pursues the aggressor. I saw one *banderillero* so closely pursued, that he saved himself only by leaping over the bull's neck. The danger, however, is scarcely so great as it appears to the spectator to be; because the bull makes the charge with his eyes shut. The danger of the picador who is thrown upon the ground is much greater: because, having made the charge, the bull then opens his eyes, and the life of the picador is only saved by the address of the chulos, who divert the attention of the victor. Generally the *banderilleros* do not make their appearance until the bull appears, by his movements, to decline the combat with the picadors, which he shows by scraping the ground with his feet, and retiring. If the bull show little spirit, and the spectators wish that he should be goaded into courage, the cry is '*¡fuego!*' and then the *banderilleros* are armed with darts, containing a kind of squib, which explodes while it sticks in the animal's neck.

"When the people are tired of the *banderilleros*, and wish to have a fresh bull, they signify their impatience in the usual way, and the signal is then given for the *matador*, whose duty it is to kill the bull. The *matador* is in full court dress, and carries a scarlet cloak over his arm, and a sword in his hand: the former he presents to the bull; and when the bull rushes forward, he steps aside and plunges the sword in the animal's neck; at least so he ought to do, but the service is a dangerous one, and the *matador* is frequently killed. Sometimes it is impossible for the *matador* to engage upon equal terms a very wary bull, which is not much exasperated. This was the case with the sixth bull which I saw turned out: it was an Andalusian bull, and was both wary and powerful. Many times the *matador* attempted to engage him, but without success; he was constantly upon the watch; always disregarding the cloak, and turning quick round upon the *matador*, who was frequently in imminent danger. At length the people were tired of this lengthened combat, and, seeing no prospect of its ending, called for the *semi-luna*, an instrument with which a person skulks behind, and cuts the ham-strings of the animal: this the bull avoided a long while, always turning quickly round; and even after this cruel operation was performed, he was still a dangerous antagonist, fighting upon his knees, and even pursuing the *matador*. The moment the bull falls he is struck with a small stiletto, which pierces the *cerebellum*; folding doors, opposite to those by which the bull enters, are thrown open, and three mules, richly caparisoned and adorned with flags, gallop in; the dead bull is attached by a hook to a chain, and the mules gallop out, trampling the bull behind them: this is the work of a moment,—the doors close,—there is a new flourish of trumpets, and another bull rushes upon the arena.

"And how do the Spaniards conduct themselves during all these scenes? The intense interest which they feel in this game is visible throughout, and often loudly expressed; an astounding shout always accompanies a critical moment: whether it be the bull or the man who is in danger, their joy is excessive; but their greatest sympathy is given to the feats of the bull. If the picador receives the bull gallantly, and forces him to retreat; or, if the *matador* courageously faces and wounds the bull, they applaud those acts of science and valour; but if the bull overthrow the horse and his rider, or if the *matador* miss his aim, and the bull seems ready to gore him, their delight knows no bounds. And it is certainly a fine spectacle to see the thousands of spectators rise simultaneously, as they always do when the interest is intense: the greatest and most crowded theatre in Europe presents nothing half so imposing as

this. But how barbarous, how brutal, is the whole exhibition! Could an English audience witness the scenes that are repeated every week in Madrid? A universal burst of 'shame!' would follow the spectacle of a horse, gored and bleeding, and actually treading upon his own entrails, while he gallops round the arena: even the appearance of the goaded bull could not be borne,—panting, covered with wounds and blood, lacerated by darts, and yet brave and resolute to the end.

"The spectacle continued two hours and a half; and during that time, there were seven bulls killed, and six horses. When the last bull was dispatched, the people immediately rushed into the arena, and the carcass was dragged out amid the most deafening shouts." (i. 148.)

*Historical Notice.*—After being in part occupied by the Carthaginians, Spain became the prey of the Romans, by whom she was finally subdued in the reign of Augustus. After enjoying a lengthened period of tranquillity and prosperity under the sway of the Romans, Spain was invaded, in the beginning of the 5th century, by the Vandals, and other Gothic tribes; and in the next century the Visigoths acquired the ascendancy, and established their supremacy in every part of Spain. The latter, however, were not long permitted peacefully to enjoy this fine and fertile country. In 711 a powerful Arabian force crossed the strait of Gibraltar, and having defeated the Visigoths, and killed Roderick their king, in a great battle near Xeres de la Frontera, in Andalusia, they speedily overran the whole country, driving the remains of the Visigoths into the fastnesses of the North, where they did not think it worth their while to follow them. But the Saracens having been signally defeated by Charles Martel, in France, and their fiery zeal having cooled, the Christians began to descend from the mountains of the Asturias, and gradually recovered portions of the lower countries. The kingdom of Leon was founded under Alphonso I., about the middle of the 8th century; and from that period, notwithstanding the superior civilisation, learning, and splendour of the Saracenic sovereigns, the Christian power was progressively increased at the expense of that of the Mohammedans.

The provinces that were wrested from the Moors were not formed into one, but into several independent states, of which Castile and Aragon gradually absorbed most of the others. In the 15th century these two leading states were united by the marriage of Ferdinand of Aragon, with Isabella of Castile; and, having conquered Granada, the last possession of the Moors, in 1492, and subsequently seized all that part of Navarre to the S. of the Pyrenees, the whole of Spain was united under the same government; and Naples being at the same time conquered, and America discovered, Ferdinand, besides being one of the ablest princes of his day, became the most powerful.

Ferdinand was succeeded by his grandson, Charles I., known in history as Charles V., Emperor of Germany; who added, by his father's side, the archduchy of Austria and the Low Countries to the vast inheritance of Spain and the Indies, now augmented by the conquest of Mexico and Peru. Charles, the most illustrious by far of the Spanish sovereigns, was succeeded in his Spanish dominions and in the Low Countries by his eldest son, Philip II., the husband of Queen Mary, of England, who, having conquered Portugal, in 1580, reduced the entire peninsula into one kingdom.

The conquest of Portugal may be said to mark the culminating point of the Spanish monarchy. The tyranny and intolerance of Philip had already, indeed, raised a rebellion in the Low Countries; which, after a struggle unexampled for duration, for the sacrifices it cost, and the weaker party, and for its beneficial consequences, terminated in the independence of the Seven United Provinces. The power of Spain now began rapidly to decline. The seeds of this decay had, however, been profusely scattered in the reign of Ferdinand and Isabella. The establishment of the Inquisition and of the censorship of the press, and the attacks made on the ancient rights and liberties of the nation, paralysed its energies; and the unsuccessful rebellion of the commons of Castile, under Charles V., and the brutal and ferocious bigotry of Philip II., extinguished every spark of civil and religious liberty, and subjected the country to the vilest of all despotisms, that which principally depends for support on intolerance, superstitious zeal, and religious quackery.

Under such a government Spain either continued stationary or retrograded, while the surrounding nations made rapid advances in the career of civilisation. Her sovereigns were as imbecile as the country; and on the death of Charles II., the last prince of the Austrian line, the monarchy was dismembered; and it was the arms of Louis XIV., and the talents of the Duke of Berwick, and not the will of the deceased monarch or the wishes of the Spaniards, that placed a Bourbon dynasty on the throne.

The new dynasty was less intolerant than that to which it succeeded; and some reforms were introduced during the course of last century. These, however, were of comparatively slight importance; and it was clear that the abuses under which the country laboured were so deeply seated, and so entwined with every existing institution, and with the habits and prejudices of the people, that they could not be eradicated, nor even materially abated, otherwise than by a revolution.

This was brought about by the weakness of the Spanish sovereigns and the immeasurable ambition of Napoleon. Not satisfied with a considerable subsidy from Spain, Napoleon wished to reduce it to the state of a prov. of France; and in this view he procured the abdication of the reigning monarch, Charles IV., and proceeded to seat his brother Joseph on the vacant throne. The opposition made by the Spaniards to this transfer, and the important results to which it led, are well known to every body, and need not be here alluded to. We are not, however, of the number of those who are inclined to ascribe any great merit to the Spaniards for their opposition to Napoleon, who, but for the interference of England, would have had no great difficulty in suppressing the insurrection. It is idle to talk of the patriotism of the Spaniards. The government, for which they took up arms, was nothing but a tissue of abuses; and their "beloved" sovereigns the merest drivellers. But the pride of the nation was hurt; and the priests, who knew that the ascendancy of the French would be a death-blow to them, did not fail to set them in the most odious light, and used every possible means to make them the objects of fanatical hatred. But, as already stated, it was the arms of England, and the extraordinary talents of her great general, and not the stupid fanaticism of the Spaniards, that repulsed the French beyond the Pyrenees. It is unnecessary to recapitulate the events that followed the restoration of Ferdinand. After years of civil war and bloodshed, a liberal government has happily been established. Whether it be destined to last, time only can show; but if it be, there can be no doubt that the abuses which still infest the country will be gradually exterminated, her gigantic resources developed, and the well-being of her people, and her power and importance in the scale of nations, vastly increased.

SPALATRO, a city and sea-port of Dalmatia, on the Adriatic, opposite the island of Brazza, lat 43° 30' 12" N., long. 15° 26' 33" E. Pop. 7,500. It is surrounded by ruined walls, is the seat of an archbishop, has a cathedral and several other churches, a lazaretto, several convents, a gymnasium, normal school, &c., with barracks, and a military hospital. It has both an outer and inner harbour, the former affording secure anchorage to vessels of any burden. It has rather a considerable trade, consisting principally in the exportation of the produce of the surrounding country, as well as of products brought from Bosnia, including cattle, horses, figs, rosoglio, wax, &c. There are thermal springs in the immediate vicinity of the town.

Spalatro, however, is seldom hardly been worth mentioning in a work of this kind, but for its containing the ruins of the magnificent palace built by Diocletian. The emperor belonged to Salona, a now ruined city about 3 m. N.N.E. from Spalatro; and being warmly attached to his native country, he retired thither to spend the remainder of his days, after his abdication of the imperial purple, A. D. 305. From the vastness of the palace, it is all but certain that he had begun its erection long previously to his abdication, though, most probably, in the contemplation of that extraordinary event. The situation seems to have been most judiciously chosen. "The soil is dry and fertile, the air pure and wholesome; and, though extremely hot during the summer months, this country seldom feels those sultry and noxious winds to which the coasts of Istria, and some parts of Italy, are exposed. The views from the palace are no less beautiful than the soil and climate are inviting. Towards the W. lies the fertile shore that stretches along the Adriatic; in which a number of small islands are scattered in such a manner as to give this part of the sea the appearance of a great lake. On the N. side lies the bay which led to the ancient city of Salona; and the country beyond it appearing in sight, forms a proper contrast to that more extensive prospect of water which the Adriatic presents both to the S. and the E. Towards the N., the view is terminated by high and irregular mountains, situated at a proper distance, and, in many places, covered with villages, woods, and vineyards." (*Adam's Ruins of Spalatro*, p. 6.) The want of good water, its only defect, was obviated by the construction of an aqueduct, which conveyed an abundant supply from Salona.

The palace was in the form of a quadrangle, flanked by 15 towers. Its longer sides, including the towers, were 698 ft. in length, and its shorter 592 ft., so that it covered in all nearly 58 English acres. It was constructed of a beautiful freestone, but little inferior to marble. "Four streets, intersecting each other at right angles, divided the several parts of this great edifice, and

the approach to the principal apartment was from a very stately entrance, still denominated the golden gate. The approach was terminated by a *peristylum* of granite columns; on one side of which we discover the square temple of *Æsculapius* (now the church of St. John the Baptist), and on the other the octagon temple of Jupiter (now the cathedral). The buildings were all lighted from the top, and appear to have consisted only of one story." (*Gibbon*, cap. 13.)

Diocletian expired in this splendid retreat, A. D. 313. The emperor Constantine Porphyrogenitus, who could only see the palace in a neglected and decaying state, affirms that no description could convey a proper idea of its grandeur. Even now, though the town of Spalatro has been principally built out of its ruins, its prodigious remains give a vivid idea of the wealth and magnificence of the Roman emperors. (*Gibbon*, ubi supra.)

SPALDING, a market town and par. of England, co. Lincoln, wapent. Elloe, div. Holland, on the Welland, 33 m. S.S.E. Lincoln. Area of par., 12,070 acres. Pop., in 1831, 6,497. Though within the fens, the town is well drained, the streets clean and well paved, and the houses have a neat appearance. It consists of four principal streets, and has a spacious market-place, at one end of which is the town-hall, erected at the expense of a private gentleman, its lower part being let in shops for the benefit of the poor. In the same place is the house of correction for the division of Holland, a brick building of four stories, constructed at an expense of 16,000*l.*, but said to be in several respects defective. (*See Inspect. of Prisons*, 3d Rep.) The par. church, originally erected in the 13th century, but rebuilt, with some additions, during the 15th, is a light structure in the perpendicular style, with a fine tower and crocketed spire, and a handsome porch. The living, a perpetual curacy, in the gift of a body of trustees, is worth 950*l.* a year nett. (*Ecclesiast. Rev. Report*.) There are places of worship for Independents, Baptists, Wesleyans, Friends, &c., and many charities; including Queen Elizabeth's Grammar School, which had, in 1835, an income of 195*l.* 15*s.*, common, blue-coat, and other schools, and an aggregate of endowments for the benefit of the poor, termed the "Town Husbands," amounting to about 450*l.* a year. (*Thirty Second Rep. on Charities*, Part IV.) There are assembly and card-rooms in the town-hall, a subscription library, a literary club, &c.; and formerly an antiquarian society was established at Spalding, of which Sir Isaac Newton, Sir Hans Sloane, Dr. Stukely, and other eminent persons, were members. The Welland is navigable thus far for sloops of 50 tons burden, which come up to the centre of the town, and land or take in cargoes at the doors of the warehouses. Spalding, which is a member of the port of Boston, has a considerable trade in corn, coal, and Yorkshire and Norfolk wool; and its weekly market is the largest in the county for the fat cattle reared in the adjacent marsh lands. Most part of the neighbourhood is appropriated to grazing.

Spalding has long been the principal seat of the law-courts for the div. of Holland. At present, quarter and petty weekly sessions, courts baron and leet, a court of requests, and a court of sewers, are held in the town-hall. Market days, Tuesdays. Fairs, April 27, June 30, Aug. 28, Sept. 25, and Wed. before Dec. 6, chiefly for cattle, horses, hemp, and flax.

SPANDAU, a strongly fortified town of Prussia, prov. Brandenburg, gov. Potsdam, at the junction of the Havel with the Spree, 7 m. W. Berlin. Pop., in 1837, ex. garrison, &c., 6,753. "Spandau, in the time of the great Frederick, was, and still continues to be, the state-prison of Prussia. It may at any moment be covered from a hostile approach by letting out the waters of the rivers which meet under its walls. Being filled with troops, it has more the air of an enormous barrack than of a town; and is, in point of fact, so regarded. Both its citadel and penitentiary are deserving of notice; the former, on account of its position on an island of the Spree, the latter, because it is said to be managed with exceeding skill." (*Gibbs's Germany*, &c., i. 56.) The citadel is a regular square with 4 ramparts, 40 ft. in height, and good casemates; the penitentiary was formerly the residence of the electors of Brandenburg, and now has, says Berghaus, 750 inmates, many of whom are criminals sent from the capital. The principal streets are clean, airy, and spacious, in spite of the disproportionate height of the houses. The church of St. Nicholas, constructed in the 16th century, has a great number of monuments. Spandau is the seat of a civil tribunal, and a forest-board; and has some manufactures of woollen and linen cloths, tobacco-pipes, and earthenware; with breweries, distilleries, &c. It was the scene of Baron Trenck's captivity. It was taken by the Swedes in 1631, and the French in 1806. (*Berghaus*; *Stein*, &c.)

SPANISH-TOWN (or *Santiago de la Vega*), the cap. and seat of the legislature of the isl. of Jamaica, co. Middlesex, on the river Coire, about 6 m. from the sea,

and 11 m. W.N.W. Kingston. It is the official residence of the governor, and the commander-in-chief, and the seat of the court of chancery, the supreme court of judicature, &c.; but has otherwise very little importance, and a pop. of at most only 5,000. It is very dirty, badly drained, and the inhabitants are at all times very subject to febrile diseases. (*Tulloch's Report on the W. Indies*, p. 56.)

**SPEY**, a river of Scotland, in the Highlands. It has its source in Loch Spey, within about 6 m. of the head of Loch Lomond, and thence pursues a N.E. course through Badenoch and Strathsay to Forchabers, below which it falls into the Moray Frith. It receives innumerable mountain streams, but no very important tributary. Following its windings, the course of the Spey is about 96 m.; but it is only about 75 m. in a direct line from its source to its mouth. It drains about 1,300 sq. m. of country, and, besides being one of the largest, is admitted to be the most rapid of Scotch rivers. Being fed wholly by mountain torrents, it is very liable to sudden and destructive inundations. It flows through what is the best wooded portion of the Highlands. The Duke of Richmond (proprietor of the Gordon estates) has several valuable salmon fisheries on this river.

**SPEZZIA** (Ital. *Spezia*), a town and seaport of N. Italy, Sardinian dom., div. Genoa, prov. Levante, of which it is the cap., at the extremity of the gulf of its own name, 50 m. E.S.E. Genoa. Pop., in 1838, inc. comm., 9,796. It is finely situated, is tolerably well built, and has an excellent harbour. Napoleon, aware of the advantages of its position, is said to have intended making it a naval station and arsenal; and since he drew attention to its importance its commerce has improved. The gulf of Spezzia (anc. *Portus Lunæ*) is about 34 m. in length, by an average breadth of half as much. It exhibits in one part the phenomenon of a powerful spring of fresh water, which bubbles up from the bottom, and preserves its purity, unaltered by the surrounding salt water, nearly to the surface. (*Coder's Italy*, i. 267.)

**SPILSBY**, a market-town and par. of England, co. Lincoln, soke Bolingbroke East, in Lindsey, on an eminence near the Limb, 10 m. from the sea, and 27 m. E.S.E. Lincoln. Area of par., 2,340 acres. Pop., in 1831, 1,384. The town consists of 4 streets, diverging from a central square, which forms the market-place. The latter is ornamented on its E. side by the market-cross, a plain octagonal shaft, with a quadrangular base, elevated on 5 steps; and on the W. by the town-hall, built in 1764. The par. church is an irregular structure, consisting of 2 aisles, with a handsome embattled tower at the W. end, said to have been built in the reign of Henry VII. In the interior are several antique monuments. The living, a perpetual curacy, in the gift of Lord Willoughby d'Eresby, is worth 164*l.* a year. Near the town is a new sessions-house and prison for the div. of Lindsey, occupying about 2 acres of ground, with a Doric portico in front, constructed at a cost of 25,000*l.* Spilby being the principal town in the R. par. of Louth, is the seat of the general quarter sessions, and of petty sessions. It has several charities; particularly a free school, founded by Lord Willoughby in 1611, and which has now an income of 60*l.* and instructs 44 poor children of the par., besides whom there are about 50 pay-scholars. (*Charity Rep.*, 32. pt. iv.) Market-days, Mondays; fairs, Monday before and after Whit-Monday, usually, and 2d Monday in July.

**SPIRES** (Germ. *Spier*; an. *Noviomagus*), a city of W. Germany, in Rhenish Bavaria, of which it is the cap., on the Rhine, where it is joined by the Speyer, 164 m. N.E. Landau; lat. 49° 19' N., long. 8° 26' 16" E. Pop., in 1833, 8,700, of whom about 3,000 were Rom. Catholics. This is supposed to be one of the most ancient cities long was one of the chief cities of Germany. In the 14th century it is stated to have had 27,000 inhab.; and in the 16th and 17th centuries it was the seat of the imperial chamber (*Reichskammergericht*), or superior court of appeal for the Germanic empire; and previously to 1689, it had 5 suburbs, enclosed within ramparts, 13 gates, and 64 towers provided with artillery. But in that year it was taken and all but destroyed by the troops of Louis XIV.; and though rebuilt about ten years afterwards, it has never attained its previous prosperity. It still occupies a large extent of ground, but its walls, which are entered by 5 gates, enclose numerous open spaces. The cathedral, which withstood the attempts of the French wholly to destroy it, is the most remarkable building. It was founded and completed in the 11th century, on the site, as is alleged, of a Roman temple of Venus; and is perhaps the most stupendous edifice existing in the round-arched style. Nine German emperors, and many other celebrated personages, have been buried in it, but their tombs were ransacked and mutilated by the French in 1689 and 1794.

Since 1819, however, the Bavarian government has done much to repair the interior of the cathedral, and the duke of Nassau has erected a splendid modern monument to his ancestor the Emp. Adolph. Spires has nu-

merous R. Cath. and two Lutheran churches, a gymnasium, an orphan asylum, house of correction, forest school, botanic garden, and a hall of antiquities, in which many curiosities found in the province are deposited. The outer walls are still standing of an old palace, in which no fewer than 49 diets have been held. Of these the most celebrated by far was that held in 1549, on the subject of the religious disputes that then agitated the empire. On this occasion the majority, consisting of the party attached to the church of Rome, agreed to a resolution by which all changes in the doctrine and discipline of the established church, not previously approved by a general council, were declared to be unlawful and of no effect. The minority, including the princes and others attached to the doctrines of the Reformers, presented, on the 19th of April, 1529, a protest against the above resolution; and from this circumstance they acquired the name of *Protestants*, which has since become the distinguishing term for those who have renounced the communion of the church of Rome, how much soever they may differ among themselves. (*Mosheim*, iv. 73, ed. 1782.)

Noviomagus was included by the Romans in Germania Prima. It was the winter quarters of Cæsar, by whom it was fortified, as a check on the incursions of the neighbouring Allemanni. Several Roman, Frank, Saxon, and Swabian emperors embellished and made it their residence; and Hen. V. of Germany gave the citizens of Spire a monopoly of the transit trade of the Rhine, and other valuable privileges. During the French ascendancy Spire was the cap. of the dep. of Mont-Tonnerre. (*Schreiber, Guide du Rhin; Berghaus, Allg. Land., &c.*)

**SPITZBERGEN** (formerly called *E. Greenland*), a group of islands in the Arctic Ocean, being the most N. land hitherto discovered, between the 76th and 81st degs. of N. lat., and the 9th and 23d of E. long., about 420 m. N.N.W. the North Cape, and nearly midway between Greenland and Nova Zembla. There are four principal islands, Spitzbergen-Propre, N.E. and S.E. islands, and Prince Charles's Island to the W. of the others; besides many islets and rocks. Their entire area does not appear to be equal to that of Iceland. They rise in many places into mountains of from 1,000 to 2,000 ft. in height, the peaks of which are covered with snow, coeval, perhaps, with their creation. The coasts are iron-bound, presenting only a few tolerable harbours; the best of these is Suerenbergh, on the W. coast, where the Dutch had once a considerable establishment. The surface is, for the most part, destitute of any vegetable or animal products; but there are a few bears and foxes, which live upon fish, &c. Spitzbergen was formerly a principal station of the whale-fishers; but the whales have for a considerable period been nearly extirpated in the surrounding seas, and it is now but little visited. It was originally discovered by Sir Hugh Willoughby in 1533, and was first visited by the Dutch in 1595. Its shores were principally surveyed by Capt. Phipps, in 1773.

**SPOLETO** (an. *Spolætium*), a city of central Italy, Papal States, cap. deleg., and formerly of the duchy of its name, on the slope of an isolated rocky hill, 33 m. S.E. Perugia, and 60 m. N. Rome. Pop. 8,000. Forsyth says that it is meanly built, with steep and dirty streets, and that it is interesting only from its remains of antiquity; but Eustace, and others, represent it in a less unfavourable light. It is connected, across a deep ravine, with a neighbouring hill, by means of a stupendous aqueduct, serving both as a conduit and a bridge, raised upon a lofty range of 10 pointed arches; which, though repaired in modern times, is, no doubt, of Roman origin. The cathedral, said to have been built in the time of the Lombards, is of a very mixed style, having a front of five Gothic arches supported by Grecian pillars, while, internally, it is in the form of a Latin cross, with a double range of Corinthian columns. It has some showy decorations; near it is a handsome fountain. The citadel, a massive stone fortress, built by Theodoric, and repaired by Narses, stands on a height overlooking the town. The Temple of Concord has been converted into a church; but, in addition to it, Spoleto has two arches, a bridge, the ruins of a theatre, and several other Roman remains: on one of the gates is an inscription importing that Hannibal's troops were repulsed in an attack on the town, after the battle of Trasymene. It has a few insignificant manufactures of woollen stuffs and hats. Under the French it was the cap. of the dep. Trasymene. It was of incomparably greater importance in antiquity than in modern times, and is reckoned by Florus among the *municipia Italiae splendidissima*. (lib. iii. cap. 21.)

*Woods, Eustace; Forsyth.*

**ST. HELENA**, an island of the S. Atlantic Ocean which will be famous in all time to come as being the scene of Napoleon's imprisonment and death. It belongs to Great Britain, and is situated 800 m. S.E. from Ascension Island, and 1,200 m. W. from the coast of Benguela, in S. Africa, lat. 15° 15' S., long. 9° 46' W. Length, 10½ m.; breadth, 6½ m.; area, 30,300 acres. Pop., about

5,000, of whom nearly a half are whites. It appears from a distance like the summit of a lofty submarine mountain, rising abruptly from the shore in rugged and almost perpendicular cliffs, varying from 300 to 1,500 ft. in height, diversified in a few places with deep narrow ravines, descending to the sea, and forming difficult landing-places for the fishermen. In the largest of these, towards the N. W., is James' Town, the cap, and port of the island. The interior is a plateau, about 1,500 ft. above the sea, divided into two unequal parts by a ridge of mountains rising about 500 ft. above the plain, and 2,000 ft. above the sea: the highest summit of this ridge, called Diana's Peak, is 2,703 ft. in height. The geological formation of the island consists almost entirely of basalt, over which in some parts are strata of limestone mingled with tuffa and other igneous substances, proving it to have once been the seat of volcanic action. A deep crater-like dell, however, called the Devil's Punch-bowl, is the only feature at all resembling an extinct volcano. The climate is mild, and little variable, the thermometer ranging between 57° and 70° Fahr. in winter (June, July, and Aug.), and between 65° and 72° in summer (Jan., Feb., and March). Rain is common, especially in Feb. and July; and the frequency of cloudy days tends greatly to moderate the heat. The influence of the climate over the constitution of residents in the island is, however, said to be most disastrous. According to O'Meara, it is "extremely unhealthy, hepatitis and dysentery prevailing to an extent and with a severity seldom paralleled, so that very few persons pass their 45th year." (*Voice from St. H.*, ii. 438.) About a fifth part of the entire surface is covered with soil, which, though not deep, is rich and productive. Luxuriant pastures are found on the high lands: agriculture, however, is but little attended to; and the inhabs. mostly depend on foreign supplies for their support. The valleys are chiefly laid out in garden ground; and here may be seen near each other, and all flourishing alike, the mango, banana, tamarind, and sugar cane of the tropics, the orange, citron, grape, fig, and olive of S. Europe, and the apple, gooseberry, and currant of a still colder region. The yam and all the European vegetables are abundant, three crops of potatoes being often raised from the same ground within the year. The tops and sides of the hills are covered with the cabbage tree, dog-wood tree, and gumwood; and the oak, also, has been introduced. The *Palm Christi* and common blackberry are so luxuriant as to be eradicated with difficulty. Cattle and sheep are not numerous, the latter being barely sufficient to supply the wants of the shipping. Goats graze in immense numbers on the high grounds. Neither birds nor beasts of prey, if we except rats, are found; but the latter are numerous and destructive, and there are many varieties of troublesome and poisonous insects. Game is abundant, and the coast furnishes excellent fish. Whales and turtles are often seen near the shore, especially in Jan. and April.

St. Helena, of which the East India Company were "the lords proprietors" till 1834, is now under a military governor, assisted by a civil secretary; and the laws are administered by the chief judge. It is still used as a place of refreshment for vessels sailing northward on the Atlantic, those proceeding southward not being able to make the island. Its commerce is trifling; the value of the imports, principally consisting of stores for shipping, not exceeding from 40,000*l.* to 50,000*l.*

James' Town, the port and the residence of the authorities, is the only town. The anchorage is good in 12 fathoms water, and the port is well protected from the winds. The town is entered by an arched gateway, within which is a spacious parade lined with official residences. The church, a handsome building, fronts the gateway; and close by it a street branches off into the inner parts of the town. The shops are plentifully supplied with English and Asiatic products, but the prices are invariably very high. The principal inhabs. reside on the higher and cooler parts of the island, and visit James' Town only on Sundays, or when the want of supplies obliges them to come to its shops and market. One of the handsomest of these villas is Port Antonio House, a mansion of considerable elegance, belonging to the governor, situated in the midst of extensive grounds, adorned with a variety of fine trees and shrubs.

Longwood, the residence of Napoleon, stands on the plateau, in the middle of an extensive park. When first occupied by the ex-emperor, it was of very limited dimensions; but some additions were subsequently made to it. After Napoleon's death, the house was for some time uninhabited. Latterly, it has been converted into a kind of farming establishment; and, very recently, the room in which the conqueror of Austerlitz breathed his last was occupied as a cart-house and stable.

St. Helena was discovered on the 21st of May (St. Helena's day), 1502, by Juan de Noya, a Portuguese; but no establishment was formed, nor was the island inhabited, till the Dutch became its masters in the middle of the 16th century. Captain Munden, in 1673, took

it from the Dutch; and it was soon afterwards granted by Charles II. to the English East India Company, who, with the exception of the period of Napoleon's imprisonment, held the proprietorship down to 1834, when it was restored to the English government. (*St. Helena Gazette*; *Major Watson's Letters on the Agr. of St. Helena*; *O'Meara's Voice from St. Helena*.)

Such is a brief notice of this very unimportant island; to which, indeed, we should not have thought it worth while to allude, but for the fact of its having been selected by Great Britain and the other allied powers as the place to which they banished Napoleon. It is unnecessary to particularise the circumstances connected with this memorable event. Suffice it to say, that after the battle of Waterloo, and his second abdication, Napoleon, having retreated to Rochefort, addressed, on the 13th of July 1815, the following letter to the Prince Regent, afterwards George IV.

"*Allies Royaux,*

"*En butte aux factions qui divisent mon pays, et à l'animosité des plus grands puissances de l'Europe, j'ai terminé ma carrière politique, et je viens, comme Thémistocle, m'asseoir au foyer du peuple Britannique. Je me mets sous la protection de ses lois, que je réclame de V. A. R., comme du plus puissant, du plus constant, et du plus généreux de ses ennemis.*" "NAPOLEON."

But though Napoleon was more than entitled to compare himself to Themistocles, he erred widely in supposing that the Prince Regent was another Artaxerxes. It was, no doubt, indispensable for the tranquillity of Europe and the world, and for the advancement of the projects of the allied sovereigns, that Napoleon should be placed under restraint. But a sense of what was due to themselves, and still more of what was due to the extraordinary individual the chance of war had placed in their power, should have secured him the best asylum and the most generous treatment consistent with perfect security. It is needless to contrast what they should have done, with what they actually did. The sending of Napoleon to St. Helena, and his treatment while there, constitute the most discreditable chapter in the history of modern royalty. It is painful to have to reflect that the government of such a country as England should have taken a conspicuous part in this unworthy treatment of a fallen foe. Every reader of ancient history heartily execrates the vindictive malignity with which the Romans pursued Hannibal. And yet, in comparing his treatment with that of Napoleon, it should be borne in mind that the Carthaginian never relaxed in his hostility to his ancient and hereditary enemies; he did not place himself in their hands, nor did he appeal to their generosity; and the probability is, that if they had got him into their power, they would have despatched him at once, and not have sent their illustrious captive to some miserable islet, to embitter and insult the few remaining years of his memorable life.

Napoleon arrived at St. Helena on the 13th of October, 1815, and there he expired on the 5th of May, 1821. His remains, after having been deposited for 19 years in a humble grave, near his prison-house, were, in 1840, conveyed with great pomp and ceremony to France, where, agreeably to the wish expressed in his last will, they now repose in the *Hôtel des Invalides*, in Paris.

ST. MAWE'S, a market-town and sea-port of England, co. Cornwall, hund. Powder, par. St. Just-in-Roseland, on the E. shore of Falmouth harbour, 2 m. E.N.E. Falmouth. Area of par. St. Just, 2,550 acres. Pop., in 1831, 1,558. The town consists of one irregularly-built street, at the foot of a hill facing the sea, the inhabs. being principally fishermen and pilots. The harbour of St. Mawe's is a creek belonging to that of Falmouth, the entrance to which is defended by St. Mawe's Castle, built in the time of Henry VIII. It is governed by a portreeve chosen at an annual court-leet. This inconsiderable place sent 2 mms. to the H. of C. from 1562 till the passing of the Reform Act, by which it was disfranchised.

ST. THOMAS, one of the Virgin Islands in the West Indies, belonging to the Danes, in about lat. 18° 20' N., long. 65° W., 36 m. E. Porto Rico. Its area is estimated at 37 sq. m., and its pop. at about 7,000, of whom 500 are whites, 1,500 free blacks, and the remainder slaves. Surface mountainous, and the island generally less fertile than St. Croix. Droughts and violent hurricanes are frequently experienced. Sugar and cotton are the principal products. St. Thomas has long been, and still continues to be, one of the principal emporiums in the West Indies. It owes this distinction partly to its convenient situation, partly to its spacious and safe harbour at St. Thomas on the S. side of the island, and partly and principally to the moderation of the import duties, which vary from 1 to 14 per cent. St. Thomas has, in consequence, become as it were a *dépôt* for the supply of the neighbouring islands; goods being sent to it to be warehoused till opportunity offers for conveying them to their

final destination. The great articles of importation are manufactured goods, principally from England, but partly, also, from other countries of Europe, with provisions, lumber, &c. from the United States. We subjoin an

ACCOUNT OF THE IMPORT TRADE OF ST. THOMAS IN 1840.

	Vessels entered.	Tonnage.	First cost Value of Imports.
			Dollars.
From Great Britain - -	42	9,208	2,100,000
France - - - -	38	6,311	610,000
Spain - - - -	7	520	25,000
Italy - - - -	9	1,284	55,000
Hamburg and Altona - -	32	5,800	960,000
Flensburg - - -	12	2,265	41,000
Bremen - - - -	9	1,452	199,000
Holland - - - -	2	506	15,000
U. States of America and Brit. America	217	50,279	968,000
Totals - - - -	368	58,152	4,997,000

In the same year the colonial arrivals were as follows:—

	Vessels.	Tonnage.
Vessels of Venezuela and New Grenada -	55	4,612
British Islands - - - -	600	9,923
French ditto - - - -	55	2,511
Spanish ditto - - - -	377	11,981
Danish ditto - - - -	321	15,637
Dutch ditto - - - -	93	3,418
Swedish ditto - - - -	18	569
Haiti - - - -	45	1,815
Totals - - - -	1,568	48,921

N. B. Besides a great number of vessels neither landing nor loading goods, being in that case free from port-charges.

#### ST. VINCENT. See VINCENT (St.).

STADE, a town of Hanover, cap. district of its own name, on the Schwinge, near its mouth, in the Elbe, 20 m. W.N.W. Hamburg. Pop., with its suburbs and garrison, about 5,700. On the bank of the Elbe, adjacent to the town, is the castle of Brunschausen, near which a vessel is stationed to receive the toll exacted by the Hanoverian government on all vessels passing up the Elbe. Stade has three Lutheran churches, a gymnasium, a cavalry school, a central workhouse, &c. Its inhabs. are engaged in manufactures of flannel, hosiery, &c., and have some share in the transit trade on the Elbe.

Since 1735 English vessels have been allowed to sail up to Hamburg without stopping to pay the duties at Brunschausen; they have, however, to be paid at Hamburg before the vessel can be cleared out. The duties are very heavy on certain descriptions of goods, and are, in fact, a great obstruction to trade. It certainly is not a little surprising that the different nations of Europe, and especially the English, should have submitted, for so long a period, to the imposition of a toll on what is really one of the most important commercial channels in Europe. If it be impossible otherwise to get rid of the nuisance, it would be good policy at once to buy an exemption from the duty.

STAFFA, a small island of Scotland, belonging to the Hebrides, famous for its basaltic columns and caverns, off the W. coast of the island of Mull, 9 m. N.N.E. Iona. It is of an oval shape, about 1½ m. in circ., consisting of an uneven table-land, resting on cliffs of variable height, the highest being about 144 ft. above the sea. The cliffs, and the caves by which they are perforated, consist mostly of basaltic columns, resting on conglomerated trap or tufa. The columns are partly perpendicular, partly oblique or horizontal, and partly bent. The average diameter of the columns is about 2 ft.; but they sometimes extend to 3 and 4 ft. They are generally pentagonal and hexagonal; they sometimes, however, have 7 or 9 sides, but are rarely triangular or rhomboidal. They are not so exquisitely united, nor are their angles as sharp as those of the Giant's Causeway.

Except on the N.E. shore of the island, at the landing-place, it is almost every where surrounded by cliffs hollowed with caverns. But the W. side being exposed to the full swell of the Atlantic, and beat by a heavy surge, has been comparatively little explored, and the principal caverns of which we have any certain information are on its E. side. Of these the most celebrated by far is Fingal's Cave, visited and described by Sir Joseph Banks, Dr. McCulloch, and Sir Walter Scott. The height of the cave, as given by McCulloch, from the surface of the water, at mean tide, to the centre of the ceiling or arch, is about 66 ft., the height of its sides 36 ft., and its depth 227 ft.\* Its sides are formed by ranges of nearly perpendicular columns; a deep chan-

nelled fissure, parallel to the sides, extends along the whole length of the ceiling, which is formed of the bottoms of columns whitened by the infiltration of carbonate of lime into their interstices. The sea never entirely ebbs from the cave, the inmost recesses of which may be discovered from without. In moderate weather boats sail up to its farthest extremity.

"It would be no less presumptuous than useless," says Dr. McCulloch, "to attempt a description of the picturesque effect of that to which the pencil itself is inadequate. But if this cave were even destitute of that order and symmetry, that richness arising from multiplicity of parts combined with greatness of dimension and simplicity of style, which it possesses; still, the prolonged length, the twilight gloom half concealing the playful and varying effects of reflected light, the echo of the measured surge as it rises and falls, the transparent green of the water, and the profound and fairy solitude of the whole scene, could not fail strongly to impress a mind gifted with any sense of beauty in art or in nature." (*Geology of the W. Islands*.)

But the noblest description of this magnificent cave is that given by the great minstrel:—

Where, as to shame the temples' dome  
By skill of earthly architect,  
Nature herself, it seem'd, would raise  
A minister to her Maker's praise!  
Not for a meener use ascend  
Her columns, or her arches bend;  
Nor of a theme less solemn tells  
That mighty surge that ebbs and swells,  
And still, between each and each pause,  
From the high vault an answer draws,  
In varied tone prolong'd and high,  
That mocks the organ's melody.

Lord of the Isles, cant. iv. st. 10.

In a note on this splendid passage, the author says, "It would be unpardonable to detain the reader upon a wonder so often described, and yet so incapable of being understood by description. This palace of Neptune is even grander upon a second than the first view. The stupendous columns which form the sides of the cave, the depth and strength of the tide which rolls its deep and heavy swell up to the extremity of the vault, the variety of the tints formed by white, crimson, and yellow stalactites, or petrifications, which occupy the vacancies between the bases of the broken pillars which form the roof, and intersect them with a rich, curious, and variegated chasing, occupying each interstice; the corresponding variety below water, where the ocean rolls over a dark red or violet-coloured rock, from which, as from a base, the basaltic columns arise; the tremendous noise of the swelling tide, mingling with the deep-toned echoes of the vault, are circumstances elsewhere unparalleled."

Mackinnon's Cave and the Boat Cave, though inferior to that now described, are also magnificent caverns.

Staffa was first made known to the public by the interesting account of it given by Sir Joseph Banks, by whom it was visited in 1772. (*Pennant's Tour in Scotland*, li. 300, ed. 1790.) It is now, during summer, frequently visited by steamers: it is uninhabited, and has not even a house or hut in which any one can take shelter during a storm.

STAFFORD, a central co. of England, having N. Cheshire, E. Derby and Warwick, S. Worcester, and W. Salop. Area, 757,760 acres. Aspect very various. The N. part, or that portion of the co. lying to the N. of a line drawn from Uttoxeter, on the confines of Derbyshire, to Newcastle-under-Lyne, consists principally of moorlands. The hills, in some parts of this district, rise to an elevation of about 1,000 ft. above the level of the sea; sometimes consisting of vast heaps of gravel, and sometimes of huge cliffs, having immense masses of rock scattered round their bases. With the exception of some beautiful valleys, the whole of this district is sterile, cold, and dreary. The soil in many places is peat; but in some parts, particularly between the rivers Dove and Churnet, it is of a superior quality, and produces good herbage. The middle and S. parts of the co. are agreeably diversified with bills, level lands in pasture and corn, plantations, and gentlemen's seats; but, in its extreme S. angle, the iron-works are its most prominent feature. The valley of the Trent is particularly fertile and beautiful. Cannock Heath, immediately to the W. of Rugeley, contained, in 1813, above 28,000 acres; and is by far the largest of the remaining tracts of waste land in the co. Mr. Pitt estimated the cultivated land, including parks, at 600,000 acres, of which he supposed, 100,000 may be meadow and pasture, and 500,000 arable. The latter he distributes as follows: viz. 200,000 acres of clay loam, or more friable mixed loam; 200,000 acres of gravelly or sandy loam, or other mixed, including calcareous soils; and the remainder, or 100,000 acres, of light sandy, gravelly, or other soils. (*Survey*, p. 13.) The air is sharp and cold; and, in the W. parts particularly, there is a great deal of rain. Stafford is more a mining

\* These measures differ in some respects, but not materially, from those given by Sir Joseph Banks.

and manufacturing than an agricultural co.; but husbandry, though not so far advanced as it might be, is, of late, very considerably improved. Wheat, oats, beans, and barley are the principal crops. The usual rotation on the clay land is, 1. fallow; 2. wheat; 3. beans; 4. seeds; 5. oats. Various important improvements have been effected within the last 20 years, particularly on the estates of the Duke of Sutherland, who has expended large sums on drainage, on the building of new, commodious, and excellent farm-houses, and on other substantial improvements. The cattle of Staffordshire are principally of the long-horned breed; but, within no very distant period, they have been extensively crossed with short-horns; and the stocks of some of the principal breeders consist, at present, entirely of the latter. Dairy husbandry is extensively practised; cheese is the principal product, and it is but little inferior to that of Cheshire and Derby. The sheep stock is estimated at about 187,000, and the produce of wool at about 3,500 packs. Property in estates, varying from 10,000*l.* a year down to 40*s.*: farms of all sizes, from 25 to 500 acres, but the smaller class is decreasing; leases frequently granted, but the greater number of farms held at will. Average rate of land, in 1810, 20*s.* an acre. Coal, iron, and lime are found in the greatest abundance in most parts of the county. It is particularly famous for its potteries and iron manufactures. The chief seat of the former is in a district denominated *The Potteries*, between Newcastle-under-Lyne and Norton-on-the-Moors, in which there are several very considerable towns and villages, mostly supported by the business. The neighbourhood affords abundance of fine clay and coal; but the finest clays are principally brought from Purbeck, in Dorsetshire, soapstone from Cornwall, and flints from the chalk pits near Gravesend, and from Wales and Ireland. The iron-works are principally situated in the S. angle of the co., in the vicinity of Walsall, Wednesbury, Bilston, &c. Their increase has been quite extraordinary. In 1830 there were, in all, 123 furnaces, estimated to produce about 212,000 tons a year, being about double the produce of 1820. And since then the increase has been but little inferior; for, though the number of furnaces has not been increased, they have been rendered so much more powerful and efficient, that their produce in 1839 has been estimated at above 367,000 tons; a quantity very decidedly exceeding all that was produced in all England besides! In this respect, indeed, Staffordshire is exceeded only by South Wales; which has, within these few years, taken the lead in this highly important branch of national industry. (*See* *Treacinar on the Iron Trade*, 292.) The manufacture of locks, nails, edge tools, bridges, spurs, and an infinity of other hardware articles, is prosecuted upon a very large scale at Wolverhampton, Bilston, and Walsall, and their vicinity. Soho, the famous establishment of Messrs. Bolton and Watt, where there is the greatest manufactory of steam-engines in the world, is situated within this co., on its extreme southern border. Glass is also made on the confines of Worcestershire. Hats, shoes and boots, are prepared at Stafford for exportation, as well as home consumption; and cotton-mills have been erected at Rochester and other places. Principal rivers, Trent, Dove, and Stour. The Trent and Mersey Canal passes through the county, dividing it into two pretty equal parts; and it is intersected by an immense number of other canals, and more recently by various railways. It is divided into 5 hundreds, excl. of the city of Lichfield and the bors. of Stafford and Newcastle-under-Lyne, and 115 parishes. It returns 17 menses to the H. of C.; viz. 4 for the co.; 2 each for the city of Lichfield and the bors. of Newcastle-under-Lyne, Stafford, Tamworth, Wolverhampton, and Stoke-upon-Trent; and 1 for Walsall. Registered electors for the co. in 1839 49, 18,489; of whom 10,020 were for the N., and 8,469 for the S. div. In 1841, Stafford had 97,576 inhab. houses, and 510,206 inhabs., of whom 258,729 were males and 251,477 females. Sum contributed for the relief of the poor, in 1838-39, 82,971*l.* Annual value of real property in 1815, 1,200,325*l.*: profits of trades and professions in ditto, 516,721*l.*

STAFFORD, a parl. and mun. bor. and market-town of England, hund. Pirchill, in the above co., of which it is the cap., on the Sow, crossed here by a neat stone bridge, 23 m. N.N.W. Birmingham. Pop. of parl. bor., which includes, with the old bor., a portion of the par. of Castle-church, in 1841, 9,152. It is generally well-built, the houses, several of which are handsome, being of brick and slate; and is paved and lighted with gas, under the provisions of a local act: a good supply of water is procured from several public pumps. The principal street runs N.N.W. from the bridge; and near its centre is the market-square, in which is the county-hall, a large modern building of stone, comprising several handsome apartments, besides an assembly-room, a grand jury room, courts for the assizes and sessions, mayor's office, and other apartments. The county gaol is also a modern structure of extensive dimensions, and well arranged, both for the health and classification of

prisoners, 200 of whom may be accommodated in separate cells. Stafford has two pars., St. Mary's and St. Chad's, now consolidated and in the patronage of the Lord Chancellor. St. Mary's Church is a large cruciform structure, in the early English style, from the centre of which rises a lofty octagonal tower; about 9,000*l.* have been raised by voluntary contributions for the repair and restoration of this venerable structure. Christchurch and St. Paul's have been recently erected; the latter is a good specimen of Gothic architecture. St. Chad's is a Norman structure, with more recent English additions. There is a small but very handsome Rom. Cath. chapel; and the Wesleyan Methodists, Independents, and the Society of Friends have each places of worship, mostly with attached Sunday-schools. The grammar school, an ancient foundation, was much enlarged by Edward VI.: the income from the endowment exceeds 370*l.* a year, two thirds of which are paid to the head master, and the remainder to the usher. It is open to all boys of the town; but the number of those on the foundation seldom exceeds 20. The appointment of the masters is vested in the corporation, subject to the approval of the Bishop of Lichfield and Coventry. A diocesan school is established here, and a Lancasterian school is supported by subscription. The institution for the relief of the orphans and widows of the clergy within the archdeaconry of Stafford is not only liberally supported by subscription, but has an income of 2,400*l.* a year, arising from funded property. Superannuated or infirm clergymen, also, are eligible for the benefits of this charity. The county infirmary, in the Foregate, has accommodation for 120 in-patients, and relieves a much larger number of patients at their own dwellings. It has a respectable medical staff. The county lunatic asylum, established in 1818, receives patients not only from the co. itself, but from the L.N.W. division generally, though the former are received on lower terms than the others. This establishment is supported both by subscription and funded property; it is admirably conducted, and may justly rank among the principal asylums in the kingdom.

The buildings comprise accommodation for 170 patients, and the gardens cover an area of several acres. There is an almshouse; but it is only poorly endowed, and fast falling to decay. The manufacture of shoes is the principal employment of the inhabitants, and several manufacturers employ 150 hands: a good workman can earn from 20*s.* to 30*s.* a week, and there is a steady demand for labour. The tanning of leather is no longer carried on to any extent. Stafford is noted, in common with the neighbourhood, for the excellent quality of its ale.

The Manchester and Birmingham Railway passes close to the town, where it has a principal station. It has been, and no doubt will continue to be, of great advantage to the town.

It has two weekly newspapers, and two banks. Stafford was incorporated in the reign of John. It is divided, under the Municipal Reform Act, into two wards, its officers being a mayor, 5 aldermen, and 18 councillors.

The assizes and quarter sessions for the co. are held here. The bor. has returned two mems. to the H. of C. since the 23d Edward I., the right of election down to the Reform Act being in the resident freemen. The Boundary Act included a part of the parish of Castle-church with the old borough. Registered electors, in 1839-40, 1,265. The custom of borough-English, by which lands descend to the younger son, to the exclusion of his elder brothers, prevails within the town and liberties.

Stafford is, also, the election-town for the N. division of the co., as well as the principal seat of a poor-law union comprising 21 pars. Markets on Saturday: fairs, April 5, May 14, June 25, Oct. 3, and Dec. 8, chiefly for horses and cattle. There is also a fortnightly cattle market.

About a mile and a half S.W. the town, on the site of a very old castle, demolished at the close of the parliamentary wars, Sir George Jerningham, now Baron Stafford, has built a massive structure after the design of the old fabric. (*Private Information*.)

STAMFORD, a parl. and mun. bor. and market-town of England, S.W. extremity co. Lincoln, on the Welland (crossed here by a stone bridge of five arches), 38 m. S. Lincoln, and 80 m. N. by W. London. Pop. of parl. bor., which includes Stamford-baron with the old bor., a small portion of the par. of St. Martin, on the opposite side of the river, and in co. Northampton, in 1841, 7,760. It is well built, principally of stone, partly paved, well lighted with gas, and supplied with water from Wothorpe, about 1 m. distant; but the streets are so irregularly laid out as scarcely to admit of description. An act of parliament was, however, passed in 1841 for correcting some of these defects, and for the better cleansing and paving the town; and the commissioners for executing the act seem resolved that its powers shall be put into full operation. Mr. Newcomb, proprietor of the

*Stamford Mercury*, has lately improved the N. entrance of the town, called *Scotgate*, by the erection of numerous houses in an admirable style of architecture; but the fact of the land N. from the river being common, and that in the parish of Stamford-baron, consisting of the park and demesne of Burghley, preclude the probability, at present, of any great increase. (*Mun. Bound. Report*.) The town-hall, rebuilt in 1776, a large and fine edifice, comprises a sessions-room, gaol, and muniment-office; the town has, also, a small well-arranged theatre, and assembly rooms. The other public buildings are the churches, of which only 6 remain out of 14. St. Mary's, considered the mother-church, was built about the end of the 13th century, and is chiefly in the later English style, having a very fine tower and spire. All Saints is an extremely handsome building, with a tower and octagonal crocketed spire. The livings are all in the gift of the Marquis of Exeter, except St. John's, of which Richard Newcomb, Esq. is joint patron. The Wesleyan Methodists, Independents, and Roman Catholics, have each places of worship, and there are numerous Sunday-schools. The grammar-school, founded in 1548, is well endowed, the income of the master being nearly 700*l.* a year; but the school has for many years just been of little service to the inhabs. A blue-coat school affords clothing and instruction to about 150 boys; the petty-school was founded in 1604, and a girls' national school was established in 1815. The endowed charities are numerous and valuable; several hospitals, or almshouses, have been founded at different times; besides which, there are several considerable bequests for the relief of the aged poor. A handsome infirmary has recently been built near the town, and furnishes accommodation for about 30 in-patients and 150 out-patients. There are no manufactures; but a considerable business is carried on in malting, and in a retail trade with the neighbourhood. The Welland is navigable for barges from hence to the sea. In the town are excellent hot and cold baths; and races are held in March and July, on Wittering Heath, in the vicinity. It has 2 weekly newspapers, and 3 banks. Markets on Monday and Friday, the latter being for corn. Fairs, Mid-lent Monday, Monday before May 12, and Nov. 8.

Stamford (an. *Stam-ford*, meaning the paved ford) was incorporated in the reign of Edw. IV. It is divided, under the Mun. Reform Act, into 2 wards, its officers being a mayor and 5 aldermen, with 18 councillors. Corp. rev., in 1839, 4,107*l.* 12*s.* 2*d.* Quarter and petty sessions are held under a recorder, and there is a court for the recovery of debts under 40*l.* The custom of borough-English, by which landed property descends to the youngest son, to the exclusion of his elder brothers, prevails here; but there is only one cophold house in the town. Stamford has, with some intermissions, sent 2 members to the H. of C. since the reign of Edw. I., the right of election down to the Reform Act being in the resident freemen and inhabs. paying scot and lot. The electoral limits were enlarged by the Boundary Act, so as to include a portion of Stamford-baron S. the river. Reg. electors in 1839, 40, 679. Stamford is likewise the principal town of a poor-law union comprising 37 par. The remains of conventual buildings, which are found abundantly in different parts of the town, show that it was formerly of some importance as an ecclesiastical settlement; and in the reign of Edw. III. it became, for a brief period, the seat of a university, which, however, soon fell to decay.

Within a short distance of the town, on its E. side, is Burghley House, the magnificent seat of the Marquis of Exeter, one of the finest Elizabethan residences in the kingdom. (*Bound. and Mun. Reports*, &c.)

STARGARD, a town of the Prussian states, prov. Pomerania, on the Ilna, in a very fertile country, 21 m. E. by S. Stettin. Pop., 8,500. The cupola of St. Mary's church is supposed to be one of the most elevated in Germany. It has a college or gymnasium, founded by a private citizen in 1631, a school of arts, &c., with distilleries and different branches of manufacture.

STETTIN, an important town and river port of the Prussian states, cap. Pomerania, and of a reg. of the same name, on the left bank of the Oder, about 36 m. above where it unites with the Baltic, lat. 53° 23' 20" N., long. 14° 33' E. Pop., in 1838, 31,100. (*Berghaus*.) It communicates by a bridge with a suburb on the right side of the river, and is very strongly fortified. It is well built, and is the most ancient as well as the principal town of Pomerania. Principal edifices, the royal castle, governor's house, mint, exchange, arsenal, and theatre. It has several churches, of which the principal, St. Mary's, was founded in 1263. The warehouses belonging to the salt company are the most extensive of any in Prussia. The royal square is ornamented by a statue of Frederick the Great. It is the residence of the provincial authorities; and has a court of appeal for the circle, a gymnasium (*ilustre*) founded in 1543, an observatory, a seminary for the training of schoolmasters, a public library, and various other literary institutions. Ship and boat

building, and the forging of anchors, are extensively carried on; there are also distilleries, with a considerable variety of manufactures. Stettin is the seat of an extensive and growing commerce, and is now, indeed, the principal port of importation in Prussia. She owes this distinction mainly to her situation. The Oder, which flows through the centre of the Prussian dominions, is navigable for barges as far as Ratibor, near the extreme southern boundary of Prussian Silesia, and is united by means of canals with the Vistula, Elbe, Spree, &c. Stettin is, consequently, the principal emporium of some very extensive and flourishing countries; and is not only the port of Frankfort-on-the-Oder, Breslau, &c., but also of Berlin; being, next to Dantzic, the principal port in the Prussian dom. Hence, at the proper seasons, its wharfs are crowded with lighters that bring down the produce of the different countries traversed by the river, and carry back colonial products and other articles of foreign growth and manufacture. Vessels of considerable burden, or those drawing above 7 or 8 ft. water, load and unload by means of lighters at the mouth of the river, at Swinemunde, the outport of Stettin, on the E. coast of the Isle of Usedom. (*See Swinemunde*.) There is a great wool fair in the month of June each year. A bank, similar to that of Berlin, is also established here, with an insurance company, &c. The principal articles of export consist of linens, corn, wool, timber, and staves, zinc, manganese, bones, oil-rake, bottles, &c. The imports consist of sugar, coffee, and other colonial products; wine, indigo, and other dye stuffs; cotton stuffs, yarn, and raw cotton; herrings, hardware, oil, tallow, coal, salt, &c. Stettin has considerable manufactures of woollen stuffs, hosiery, leather, sail-cloth, tobacco, &c., and the most extensive sugar refinery in Prussia. In 1834 there belonged to the port 200 vessels of the burden of 49,892 tons, being about one third part of all the ships belonging to Prussia. During the same year there entered the port 1744 ships, of the aggregate burden of 175,348 tons.

STEBURNVILLE, a town of the U. States, in Ohio, cap. Jefferson-co. on the Ohio, 45 m. W. by S. Pittsburg. Pop., in 1840, 5,203. It is a flourishing well-built town, having woollen, cotton, steam-engine, and other machine factories; saw, flour, and paper mills; printing establishments, &c.; the machinery in many of which is impelled by steam. It presents every probability of a rapid increase, the country around being rich and populous. (*Amer. Almanac*, and *Cyc.*)

STEYNING, a market-town and par. of England, co. Sussex, rape Braurham, hund. Steyning; area of par. 3,290 acres. Pop. in 1831, 1,436. The town, on the Adur, 5 m. from the English Channel, and 1½ m. S. Horsham, consists of four indifferently built streets. It has a very curious Norman church, with a great variety of excellent and very elaborate detail. (*Tricknam's Gothic Archit.*) The living, a vicarage worth 308*l.* a year, is in the gift of the Duke of Norfolk. Brotherhood Hall, an old edifice of the time probably of Henry VIII., is appropriated to a free school, founded in 1614, for the classical education of 10 boys. This town has never been of any considerable importance, and, in fact, would not have been worth mentioning in a work of this kind, but for the circumstance of its having sent 2 members to the H. of C. from the reign of Edward II. to the passing of the Reform Act, by which it was disfranchised. The franchise was nominally vested in the inhab. householders paying scot and lot; but was really in the hands of the Duke of Norfolk, the proprietor of the bor. It is a polling place for the W. division of the co., and has petty sessions.

STIRLING, a central and marit. co. of Scotland, having N. the co. Perth, E. the Frith of Forth and Linlithgow, S. the latter, Lanark, and Dumfriesshire, and W. the latter and Loch Lomond. Area, 321,280 acres, incl. 8,320 acres water. Surface extremely diversified, consisting partly of high mountains; partly of extensive moors, bogs, &c.; and partly of very rich alluvial carse lands. Ben Lomond, the most celebrated and best known of the Highland mountains, in the N.W. part of the co., immediately above Loch Lomond, has an altitude of 3,191 ft. The Fintry, Campsie, and Lennox hills lie in the middle and S. parts of the co.: the surface, from Denny N.W. to Loch Lomond, is in most places very bleak and sterile. The low alluvial or carse lands, which are extremely productive, lie on both sides the Forth but principally on its S. bank, extending from Falkirk to above Stirling. They are supposed to comprise, in all, from 35,000 to 45,000 acres. They consist principally of a bluish clay, intermixed with sand. In the W. parishes clay soil predominates; and, as it rests on a bottom of hard ferruginous clay (*till*), it is cold and wet. In some places along the rivers the soil is light and gravelly. In the high moors it is mossy; and in the lower grounds there are considerable peat bogs. Several large estates; but property a good deal divided. Farms in the lower districts vary from 20 to 300 acres; but, in the hilly and mountainous districts, they are much larger. Agriculture very various; but gene-

rally well suited to the situation and climate. Drainage has recently been practised on a very extensive scale. In the earse, wheat, beans, barley, and clover, but particularly the first two, are the principal crops. On the lighter lands, turnips are largely cultivated; oats being the prevailing crop on all the poorer high lands. Potatoes generally cultivated. Sheep mostly of the black-faced Lincoln breed; but Cheviots have been largely introduced. Besides the cattle bred in the co., which are not remarkable for their goodness, great numbers of Highland cattle are annually purchased for feeding at the Falkirk *trysts*. These are the greatest fairs, or markets for cattle of any in Scotland. They are held on the 2d Tuesday of Aug., Sept., and Oct.; the last being the largest. Cattle in all sorts of condition are brought to them from all parts of Scotland, but principally from the north; as are also sheep and horses. At an average, it is supposed that about 80,000 cattle, 50,000 sheep, and 5,000 horses, are annually disposed of at these *trysts*. Estimating the cattle at being 77, the sheep 11s., and the horses 10s., the entire value will be nearly 550,000*l.* (*Yearly Income*, &c., p. 121.) Stirlingshire is said to have about 13,000 acres of natural wood, and above 10,000 acres of plantations. The E. parts of the co. have a finely diversified appearance; and the view from Stirling Castle is, perhaps, unequalled by any other in Britain. (See next art.) Coal abundant; and there are large supplies of ironstone, freestone, &c. Average rent of land in 1810, 11s. 4d. an acre. Extensive works have long been established at Carron, for the smelting of iron, and the manufacture of all sorts of cast-iron goods, whether for civil or warlike purposes. (See *CARRON*.) Exclusive of distilleries, some branches of manufacture, on a pretty considerable scale, are carried on at St. Ninian's, Stirling, Falkirk, and other towns. Principal river, Forth; to which are tributary the Carron, Bannockburn, and other small streams. Stirling has 25 par., and returns 1 mem. to the H. of C. Registered electors for the co. in 1839-40, 2,323. The bor. of Stirling unites with the bors. of Inverkeithing, Dunfermline, Queensferry, and Culross; and the bor. of Falkirk with those of Linlithgow, Lanark, Aldrie, and Hamilton, in returning representatives. In 1841 Stirling had 15,837 inhabited houses, and 82,179 inhabitants, of whom 41,070 were males, and 41,109 females. Valued rent, 108,509*l.* Scotch. Annual value of real property, in 1815, 218,761*l.*

STIRLING, a royal and parl. bor., river port, market town, and fortress of Scotland, cap. of the above co., on the Forth, 20 m. W.N.W. Edinburgh, and 22 m. N.E. Glasgow. Pop. of parl. bor., which includes the suburb of St. Ninians, in 1841, 10,745. The situation of Stirling is magnificent in the extreme. It is built on the S.E. declivity of a hill, which, rising from one of the most fertile plains in Scotland, terminates on the N. and W., immediately over the river, in an abrupt basaltic rock, about 300 ft. in height, surmounted by a fine old castle. It consequently bears a striking resemblance to Edinburgh; but its situation is finer, more central, and in all respects more suitable for the capital of Scotland. The view from the castle, if not unrivalled, is, at all events, certainly unsurpassed by any other in the empire. It combines all that can give variety, interest, and grandeur to a prospect. To the E. it extends over the richest valley in Scotland, as far as Edinburgh, commanding all the windings of the Forth; to the W. is the fertile strath of Menstith, the view in this direction being bounded by Ben Lomond; on the N. it is bounded by the range of the Ochil hills; and immediately to the S. is the field of Bannockburn, the Marathon of Bruce and of Scotland.

"The principal street, which extends from the castle down the ridge of the hill, with narrow cross streets branching from it down the declivity on each side, is open and spacious; and the houses, though many of them bear marks of antiquity, are generally lofty and comfortable. A new bridge over the Forth (finished in 1835) has been begun, and streets are proposed to be built from it on the low ground to the E. of the town. Several neat houses have lately been erected in the neighbourhood. Many respectable families have been induced to settle in Stirling, in consequence of the cheapness of living, the beauty of the surrounding country, and the society which the town affords." (*Bound. Rep.*)

The principal building is the castle. A fortress is said to have been erected on its site by the Romans, and there can be no doubt of its great antiquity. Its inaccessible situation in the centre of the kingdom, at the point where the Forth first becomes fordable, renders it, as it were, the key of the Lowlands on the one hand, and of the Highlands on the other. No wonder, therefore, that Stirling early became a place of great importance, and that it was for a lengthened period a favourite royal residence, and the seat of the legislature. Previously to the invention of artillery, the castle was a place of great strength; but, notwithstanding the additions made to the works in more modern times, it could not oppose

any effectual resistance to an army properly supplied with artillery. It is a quadrangular building, with an open area in the centre, and, besides other structures, includes the old royal palace, principally built by James V., and the parliament house; but these venerable structures have, by a scandalous outrage on taste and national associations, been degraded into barracks for common soldiers! It is stipulated in the articles of union with England, that Stirling castle shall be always garrisoned, and kept in repair.

Among the public buildings in the town are the town-house, gaol, Cowan's hospital, founded in 1639, and richly endowed; the atheneum, with a spire 120 ft. in height, a hall for the circuit and sheriff courts, &c. The old church, a venerable Gothic edifice, a portion of which formed part of the Franciscan monastery, founded in 1494, has long been divided into two places of worship: James VI., when a child, was crowned in it, on the 29th of July, 1567, the coronation sermon being preached by the famous reformer, John Knox. Three churches belong to the Secession, and the Reformed Presbytery, Independents, Epianonians, Wesleyan Methodists, and Roman Catholics, have each 1 church. There are altogether 4 churches belonging to the establishment. Some of the houses formerly occupied by the principal Scotch nobles are still met with in different parts of the town. Religious dissent prevails in Stirling, perhaps to a greater extent than in any other town of Scotland. Ebenezer Erskine, one of the ministers of Stirling, was (along with his brother Ralph, one of the ministers of Dunfermline) a founder of the Secession, or Associate Synod, about 1740. This town has been long eminent for its schools, particularly those for classical literature. It has also a mechanics' institute, and several public libraries.

Exclusive of Cowan's hospital, noticed above, founded by a citizen of that name, Stirling has two other well-endowed hospitals, exclusive of the interest of 4,000*l.* left in mortmain for behalf of the poor. But, "where the carcass is, there will the eagles be gathered together," and, notwithstanding the ample provision in question, pauperism is quite as prevalent in this as in most other Scotch towns.

The chief manufacture is that of tartans, tartan shawls, carpets, and yarns, which is carried on to a large extent; and the dyeing of yarns, home-made cloths, and silks is also carried on. Cotton goods are manufactured, though to no great extent, with ropes, malt, leather, soap, and candles. The town has extensive markets, the Corn Exchange being one of the finest in Scotland: it has also a considerable coasting and retail trade. About 100 vessels are said to be engaged in the trade on the Forth up to Stirling, and steam-packets, which in summer are crowded with passengers, ply daily between the town and Granton Pier, near Edinburgh. (*Bound. Rep.*) The town has a branch bank of the Bank of Scotland, and four other branch banks, and two weekly newspapers.

Stirling received its first charter from Alexander I. in 1120: it is now governed by a provost, 3 bailies, and 18 councillors. Corporation revenue, about 3,000*l.* a year. The bor. unites with Dunfermline, Culross, Inverkeithing, and S. Queensferry, in sending 1 mem. to the H. of C. Registered electors, in 1839-40, 497.

Stirling and its immediate vicinity has been the scene of some of the most memorable events in Scotch history. In 1297 Wallace defeated a formidable English army close to the town; and the victory of Bruce at Bannockburn, in 1314, secured the independence of Scotland. James II. was born in the castle; and there, in 1452, he basely murdered, with his own hand, the Earl Douglas, whom he had inveigled thither by the grant of a safe conduct, and the assurances of friendship! Stirling was also the birth-place of James V., and it continued to be his favourite residence. Here, also, James VI. resided with his tutor, the celebrated George Buchanan (*Scotorum sui sacculi facili principes*), till he was 13 years of age; and here, as already stated, he was crowned in 1567.

The abbey of Cambuskenneth, one of the richest and most magnificent in Scotland, stood on the banks of the Forth, a short way from Stirling. Its ruins are still very considerable. (*Private Information.*)

STOCKBRIDGE, a market-town and par. of England, co. Hants, hund. King's Sonnewood, on the Test, a tributary of the Anton, and on the Andover Canal, 8 m. W.N.W. Winchester. Area of par., 220 acres. Pop., in 1831, 851. The town comprises only a single street, in which are numerous inns, its principal support being derived from its situation on the high road between London and Exeter. It has a town hall, a neat edifice, erected in 1810 by the present Marquis of Westminster. From the first of Elizabeth down to the passing of the Reform Act, by which it was disfranchised, this petty place, or rather its proprietors, enjoyed the privilege of sending 2 mems. to the H. of C.

STOCKHOLM, a celebrated city of the N. of Europe, the cap. of Sweden, at the junction of the Lake Mælar with the Baltic, 440 m. W. by S. Petersburg, lat. 59° 29' 31" N., long. 17° 54' E. Pop., in 1839, 83,885.

It is very strikingly situated, partly on a number of islands, at the entrance of the lake, and partly on the mainland, upon both sides of the Strait, covering altogether an area of about 4½ sq. miles. The view of the city, when approached from the Baltic, commands the palace, the principal bridge, and other prominent objects, and is extremely grand and imposing. "On the islands, and more particularly on those called *Stockholm* (isl. of the Castle), *Riddarholm* (Knights' isl.), and *Helge Aud's holm* (isl. of the Holy Spirit), all so near each other that they are united by 13 short bridges of stone, and others of wood, stand the king's palace, the great cathedral, the bank, the hall of the diet, and most of the more conspicuous ornaments of the city: but the larger portion of the private houses are built on the mainland, which on the N. side, called the *Nörrnalm*, or N. suburb, slopes gradually backwards from the shore; but on the S. side, or the *Södermalm*, rises in bold abrupt cliffs, where the white houses nestle beautifully among Sinding trees. The streets on the mainland are in general pretty regular, though not very wide; but many of those on the islands are as narrow and crooked as a lover of irregularity could desire. On the three principal islands most of the houses are of stone, but in the N. and S. suburbs the greater part are of stuccoed brick, painted white, yellow, or faint blue. In the remote suburbs, wood is still the only material employed. In most of the houses the stairs and lobbies are of a dark blue stone, with such a slippery surface that the stranger is exposed to many a tumble before he gets accustomed to them. Most of the great thoroughfares are tolerably well paved, but they are almost wholly destitute of foot-paths. In all parts of the city it has been necessary, from the nature of the ground, to build upon piles. There are no fortifications of any kind round Stockholm." (*Bremer*, i. 312.)

Except some churches, few buildings of importance are situated in the N. suburb. It contains, however, the two principal squares of the city; one of which, the "King's Garden," bordered with large shady trees, has a good statue of Charles XIII.; while the other, called the square of Gustavus Adolphus (one side of which is formed by the opera house, in which Gustavus III. was assassinated in 1792), has a well-executed statue of the hero whose name it bears. From this square a very handsome bridge opens a communication with the principal island and the royal palace; and, as all heavy goods are here carried by water, it forms the most fashionable and agreeable lounge in Stockholm. The line of this bridge crosses Helge-Aud's island, cutting off a small portion of the latter, which, being fitted up as a garden, is the resort of the best society of the capital. The *Södermalm*, or S. suburb, is connected with the city by a bridge, underneath which are sluices for drawing off the waters of the lake. It has 2 fine churches, and a statue of Charles XII. on the military parade.

Though Stockholm has numerous statues, it has but few public edifices of an ornamental character. The palace, however, an immense quadrangular edifice, begun during the reign of Charles XII., has a majestic appearance from whatever point it may be viewed. Its N. and S. faces being prolonged eastward, towards the sea, inclose between them a flower-garden. The lower part is of polished granite; the upper, of brick covered with cement. It contains a museum of antiquities and sculpture, with several good works by Swedish artists; a picture-gallery, in which are a few fine paintings by Raphael, Teniers, Paul Potter, Ostade, &c.; some other superior paintings in the queen's apartment; the royal library, with 40,000 vols. (*Bremer*), in which a copy of every book printed in Sweden must be deposited; the mint, the repository of national archives, and a chapel, very splendidly fitted up. Broad and massive quays, which surround the palace on its E. and N. sides towards the principal harbour, effectually prevent the noise and confusion of the shipping, which at one point is very dense, from reaching the royal apartments. On one of the quays, within view of the palace windows, is a statue of Gustavus III.; and at the other end of the avenue leading from this point, a small, but handsome obelisk, has been raised to his memory. The king's stables, on an adjacent island, form a very extensive quadrangular building, having accommodation for 120 horses. The churches, externally, are in general devoid of architectural merit; but the cathedral or St. Nicholas's church, adjoining the palace, in which the kings of Sweden are crowned, is imposing, from its mass, and has some paintings and sculptures of merit, and a remarkable piece of carving, representing St. George and the dragon. But the most interesting church is the Riddarholm, in which the kings of Sweden are buried, and in which are preserved many national military trophies. The spire of this church, destroyed by lightning in 1835, has since been replaced. There are also German, Finnish, and Scotch Presbyterian churches; a synagogue, &c. The Riddarhuset, or Hall of the Diet, erected in the time of Christina, is in a peculiar style of architecture, and has

its roof ornamented with statues. The room in which the Diet assembles is of moderate size. Its walls are hung with the armorial bearings of the principal Swedish families, and its seats are subdivided into 4 distinct compartments, without, however, any difference as to the mode of their fittings. The president's chair, a fine specimen of Dutch workmanship, is at the upper end of the hall; the nobles' seats being on the right, those of the clergy on the left, and those of the town and country deputies in front. In the intervals of the diets the hall is sometimes used as a concert-room. The town-house is an old-fashioned building, with 4 wings. The military hospital, on one of the more remote islands, is among the best establishments of its kind in Europe. The hospital, founded by Gustavus III., though spacious, is not so well conducted.

There are several well-ordered prisons, and public charities of various descriptions; including a foundling hospital, to which many children are carried, and which, in fact, is one of the principal sources of the profligacy for which the city is distinguished. In the country parts of Sweden, the proportion of legitimate to illegitimate children is about 20 to 1; in the towns, as 64 to 1; whereas in Stockholm, it is under 23 to 1! The pop. of Stockholm has long been nearly stationary, or has but slowly increased. The mortality is very heavy, the deaths exceeding the births by above 1,200 a year; a result ascribable partly to the mortality occasioned by the foundling hospital, and partly to the prevalence of dram-drinking, and the poverty and damp lodgings of a considerable portion of the lower classes.

There are several public parks in the neighbourhood of Stockholm. The most celebrated is the *Djurgården* (deer-garden), to the E. of the city. From its great extent, and romantic character, *Bremer* says it "is, without exception, the finest public park in Europe." The rugged peninsula, of which it occupies the greater part, is so finely varied with rocks and trees, that art, which must do every thing in the parks of other great capitals, has here only not to figure nature. The margin of the peninsula is covered with old-fashioned eating-houses, &c. Within this confused circle runs the beautiful carriage drive, lined with modern villas of classical design, Swiss cottages, Italian verandahs, &c. Among these are placed coffee-houses, equestrian theatres, and dancing-rooms, while the space between them and the road is occupied with flower-plots and shrubberies, through which rustic seats are scattered. In this park is the bust of Belman, a lyric poet of great excellence, in the time of Gustavus III. The anniversary of this poet's birth is kept with great rejoicings by all classes, but especially the *Bacchanal Club*, whose members, headed by the king himself, come off in festive array, to parade round this bust, which is very appropriately decorated with grapes and vine-leaves." (*Bremer's Ecceus*, i. 360, 361.) Not far from this popular monument is *Rosendahl*, a favourite summer residence of the king. This, like all the other houses in the park, is a portable wooden edifice, which species of structure is very common all round Stockholm. *Drottningholm*, Haga, &c., at different distances from the capital, are other royal summer residences. Near *Rosendahl* Palace is an immense porphyry vase, 9 ft. in height, and 12 ft. in diameter, which cost about 10,000*l*. Opposite Haga is the new burial-ground, a spacious cemetery, in which are some fine monuments. Carlberg and Ulrikdahl were formerly royal palaces; but the former has been converted into a military academy, and the latter into a military hospital.

Stockholm is the principal emporium of Sweden. The entrance to the harbour from the Baltic is intricate, and should not be attempted without a pilot; but the water is deep, and the harbour itself capacious and excellent, the largest vessels lying close to the quays. The principal exports are iron, timber, and deals. The shipping engaged in foreign trade has materially declined of late years; it amounted, in 1839, to only 136 ships, of the aggregate burden of 22,470 tons. (*See SWEDEN*.)

Stockholm is also the principal manufacturing town of the kingdom, having woollen cloth, cotton, linen, silk, glass, and earthenware factories, iron-works, including a factory for the construction of steam-engines, &c. conducted by a Mr. Owen from Glasgow, sugar refineries, breweries, &c. "The stranger who has lately come from Copenhagen is greatly struck with the contrast between its streets and those of Stockholm. The silence and order of the Danish capital are here replaced by a degree of turmoil and activity, indicative at once of greater wealth and greater industry. The number of showy or well-filled shops is not very great, nor are they much frequented; but in all the more central streets, especially near the palace, gay equipages are in constant motion; and the principal quay, except at the resting hour of noon, exhibits all the bustle of a thriving sea-port." (*Bremer*, i. 357.) The more important branches of commerce are generally carried on by natives of the city; settlers from the provinces being comparatively few, except such as are engaged in the more laborious

kinds of occupations. Foreigners, consisting principally of Germans and Englishmen, with about 600 Jews, are but few in number. Considering, indeed, that the king is a native of France, and the proximity of the city to Russia, the small number of Frenchmen and Russians may well excite surprise.

A few years since it was a common complaint that there were no good hotels, and that lodgings were both scarce and dear in the city. But several inns have been recently built, and, according to Bremner, the Stockholm hotels may now be considered fully equal to those of second-rate towns in other parts of the continent. They do not supply dinners, which may, however, be had at the eating-houses, where a pretty good dinner may cost about 2s. "Even at the most fashionable places in the park," says Bremner, "the charge, as compared with England, is extremely moderate. We happened to see the bill for a dinner that would not have disgraced the Star and Garter. Fish, fruit, and every delicacy of the season, were served in profusion. The wines, also, were first-rate, and included port (here a dear wine), sherry, claret, Rudesheimer, champagne, and punch, supplied to 24 guests; yet the whole charge, including attendance, was only 250 rik-dollars, or about 12s. a head."

During the summer season nearly all persons in tolerable circumstances spend the greater part of their time in the environs. At all the public places visitors are waited on by women; and a stranger is surprised to see many employments entrusted to men in other countries here undertaken by females. The ferry-boats, for instance, are almost all rowed by Dalecarlian females, in their peculiar native costume; though, if we may rely on Mr. Murray's account, their beauty is not very likely to be much injured by this masculine employment.

Stockholm is not the seat of a university, but it has several distinguished academies, including the Academy of Sciences, established about 1740, with an admirable museum of zoology; the Swedish Academy, founded by Gustavus III.; the academy of painting and sculpture, which has produced Sergel, Fogelberg, Bystrom, &c.; and that of literature, a college of medicine, schools of navigation, drawing, &c., with societies of agriculture, commerce, and philosophy. There are also several clubs and reading-rooms, on much the same plan as those of London, and various newspapers.

Stockholm appears to have been founded by Birger, regent of Sweden, in the 13th century. It became the residence of the Swedish sovereign soon after Birger's death, but was not recognised as the capital till the 17th century, previously to which, Upsala had been the seat of the court. (*Stockholm and its Environs*, Stockholm, 1839; *Bremner, Excursions in Denmark, Sweden, &c.*, ii. 310-405; *Murray's Handbook for the N. of Europe*; *Core*, &c.)

**STOCKPORT**, a parl. bor., and manufacturing town of England, co. Chester, on the border of Lancashire, 5 m. S.E. Manchester, and 10 m. N. Macclesfield. The parl. and mun. bor. comprises the township of Stockport, with part of those of Brinnington and Heaton-Norris, and the hamlets of Brinkway and Edgeley in the adjacent par. of Cheshire; and had, in 1831, a pop. of about 42,000 \*, and in 1841, of 50,495. The town-proper, which is supposed to occupy the site of a Roman military station, is built on an abrupt hill beside the Mersey, which, sweeping round its E. and N. boundary, is here joined by the Tame. From the bank of the river the houses rise in successive tiers round the sides of the hill, from the base to the summit, some having apartments excavated in the sandstone rock; and the numerous extensive factories elevated above each other, and spreading over the town, give it, especially when lighted up at night, a striking appearance. The most ancient part of the town surrounds the church and market-place on the top of the hill, whence various streets diverge in different directions. The principal street, called the Underbank, follows the direction of the old Roman road S. to Buxton. Three bridges across the Mersey connect the town-proper with its suburbs of Portwood and Heaton-Norris.

Portwood, in the township of Brinnington, is large, populous, and of considerable manufacturing and commercial importance. To the W. of Stockport numerous streets, houses and factories, cover the greater part of the hamlets of Brinkway and Edgeley. Heaton-Norris, which is situated in Lancashire, communicates with the better part of Stockport, by a new line of road, made within the last 15 years, and a noble bridge of 11 arches across the valley and the river. The arch over the river, built of hard white stone, has a span of above 30 ft., and an elevation of 40 ft. above the water. The arches on the Cheshire side are carried across several streets, leaving thoroughfares underneath. Stockport is well paved, and lighted with gas; and there is an ample supply of water, at a reasonable rate. The par. church, the chief public edifice, appears to have been erected in the 14th century,

but has been much patched up in later times. The chancel had a fine decorated E. window; but this has been removed. At the W. end of the church is a lofty square tower, crowned with a pierced parapet and pinnacles; and in the interior are several ancient monuments.

The living, a rectory of the clear annual value of 1,882z., is in the gift of Lady Vernon. There are 2 chapels of ease, St. Peter's and St. Thomas's, both perpetual curacies, the former worth 220z., in private patronage; and the latter, worth 110z. a year, and in the gift of the rector of Stockport. St. Thomas's, an elegant building in the Grecian style, was erected, in 1825, by a par. grant, at an expense of 14,555z. There are places of worship for Independents, Methodists, Friends, Unitarians, Roman Catholics, &c.; and a good and handsome subscription news-room. A covered market is not much frequented; but the large open market in the centre of the town is well supplied and well attended.

(*Mun. Corp. Rep.*) A free grammar-school, founded in 1487, is under the government of the Goldsmiths' Company of London. It gives gratis instruction to 150 boys, from 6 to 14 years of age, sons of inhab. of Stockport, &c., in the ordinary branches of education. Their nomination rests with three visitors appointed by the Goldsmiths' Court of Assistants. The master has a salary of 210z., and the usher of 105z. A few Scotch handsome buildings for this foundation have been lately erected at a cost of about 4,000z. A large national school was established at Stockport in 1805; and handsome school-houses, &c., were built, at an expense of 10,000z. A great number of children of both sexes are educated here; and without the town this establishment has several branch schools. Most of the religious denominations have their own Sunday-schools. There are almshouses, for 6 poor men, founded in 1683; and various other charities for the relief of the poor. (*31st Rep. on Charities*.) Two weekly newspapers are published in the town; and it has a joint-stock bank and two branches of other proprietary banks, exclusive of a savings' bank.

Formerly 2nd and 3rd weaving of silk were the principal branches of industry in Stockport, but these have declined in favour of the cotton manufacture, which now occupies the greater part of the pop. Several large factories have been constructed of late years. There are also several silk-mills in full activity, the rivers affording an ample supply of water. (*Mun. Rep.*) The importance of Stockport as a manufacturing town is, however, chiefly owing to its abundant supply of coal, obtained from Poynton and the districts on the line of the Manchester and Ashton Canal, with which it communicates by a branch canal. In 1839, there were in the par. 25 cotton-mills, wrought by 1,300 steam-engines, and employing upwards of 6,800 work-people. (*Mills and Factories Rep.*)

The weaving of cotton has spread itself over all the neighbouring villages; and calico-printing is carried on to a great extent, there being many large dye-houses in the vicinity. Fine woollen cloths, hats, &c., are also manufactured; and the construction of machinery is an important department. The mun. bor. is divided, under the Municipal Reform Act, into 6 wards, and is governed by 14 aldermen and 42 councillors. The ancient charter of incorporation is of uncertain date. The office of mayor was, till a late period, mostly honorary; the town now has a commission of the peace. Corp. revenue in 1840, 1,518z. The Reform Act conferred on this bor., for the first time, the important privilege of returning 2 mems. to the H. of C. Reg. elect. 1839-40, 1,279. By far the most interesting object in the vicinity of Stockport is the stupendous viaduct of the Manchester and Birmingham Railway over the Mersey, erected at a cost of 100,000z. This town was a military post of some consequence previously to the Conquest; but as it is not mentioned in Domesday Book, it had probably been destroyed at that epoch. No remains now exist of its old castle. In the civil war, Stockport was first garrisoned by the parliament; then taken by Prince Rupert; but finally retaken by the parliamentary troops, who retained it till the termination of the contest. (*Bound. and Mun. Rep.*, &c.)

**STOCKTON-ON-TEES**, a town, sea-port, mun. bor., and par. of England, being, next to Newcastle and Sunderland, the principal port in the kingdom for the shipment of coal, co. Durham, ward Stockton, on the Tees, near its mouth, 17½ m. S.E. Durham. Area of parish, which comprises the townships of Stockton, Preston-on-Tees, and Hartburn, 4,190 acres. Pop., in 1831, 7,391. But nearly all this population is aggregated within the limits of the municipal bor., which lies wholly within the township of Stockton. The town, one of the cleanest and handsomest in the N. of England, consists of a straight and wide main street, about ½ m. in length, running from N. to S.; in which are many good houses, built chiefly of brick, though a few are of stone, taken from the old castle. From this street, smaller ones branch off on the E. towards the river; while on the W. a great many new houses and streets have been recently built. In the N.E. part of the town is a spacious square, lately enclosed and planted, in which are some good

\* The Municipal Corporation Report says, approximately, 43,000.

buildings. About the middle of the high street is the town hall, a commodious square edifice, with court, assembly, and other public rooms; but partly occupied as an hotel; and near it is a handsome Doric column, on the place formerly occupied by an open cross. Near the S. end of the town is a handsome stone bridge, with 5 elliptical arches, erected by subscription, between 1764 and 1769, at an expense of 8,000*l*. The tolls of the ferry over the Tees were previously the property of the Bishop of Durham, to whom a considerable annuity was made payable by the shareholders; but the whole debt having been paid off, the bridge became toll free in 1820. A little further S. the Tees is crossed by a suspension-bridge, forming part of the Middleborough branch of the Darlington and Stockton Railway. The Port Clarence Railway terminates on the Tees, a little N.E. of Stockton. The town is watched by an efficient police, and well lighted with gas.

The par. church is a neat brick edifice, with a tower 80 ft. in height at its W. end. The living, a vicarage, worth 247*l*. a year nett, is in the gift of the Bishop of Durham. There are places of worship for Baptists, Friends, Independents, Methodists, Unitarians, and Rom. Catholics, several having Sunday-schools attached; a mechanics' institute and library, a subscription-library, and a neat theatre. A charity-school was founded here by subscription in 1721, and a school for girls in 1803; and Stockton, with the adjacent parish of Norton, has a scholarship at Brasenose College, Oxon. Some almshouses, established in 1692, were rebuilt in 1816, and afford accommodation to 36 poor persons. It has a dispensary, a savings' bank, and many benefit societies.

The only manufacture is that of sail-cloth; for which there were, in 1837, three considerable establishments, one employing nearly 400 hands. The two railroads which pass to the town employ a good many hands; and Stockton is said to be in a prosperous state. (*Mun. Corporation Rep.*) New coal mines of large extent have recently been discovered in the neighbourhood, and the trade of the port has increased considerably of late years. In 1839, there were shipped coastwise from Stockton, 1,308,778 tons coal, exclusive of 86,620 tons shipped for foreign ports. In 1840, Stockton supplied the metropolis with 1,835 cargoes of coal, amounting to 495,360 tons. Linen and worsted yarn, and lead, &c., are also shipped in considerable quantities. Gross amount of customs' duties collected at the port, in 1840, 97,225*l*. The port dues belong to the Bishop of Durham, as lord of the manor, but are leased to the corporation at a nominal rent. Stockton is supposed to have been incorporated about the 13th century. The mun. bor. is now divided into 2 wards, and is governed by a mayor, 5 other aldermen, and 18 councillors. Corporation revenue, in 1840, 1,201*l*. The bor. has, under the Mun. Reform Act, a commission of the peace; besides weekly petty sessions and courts baron 8 times a year, for debts not above 4*l*. There is, however, no gaol, but only a lock-up house in the bor. Stockton is of considerable antiquity, and was long the occasional residence of the bishops of Durham. Its castle was demolished by order of parliament in 1647. (*Mun. Corp. Rep. and Appendix*, iii. &c.)

**STOKE-UPON-TRENT**, a par. bor., township, and par. of England, co. Stafford, hund. Pirehill, on the Trent, 2½ m. E. Newcastle-under-Linc. and 15 m. N. by W. Stafford. Area of par., 10,490 acres. Pop., in 1831, 37,230. The par. bor. comprises the most populous portion of the par., including the townships, or rather towns, of Hanley, Shelton, Lane End, Fenton, &c., with those of Burslem, Tunstall, and Ruston Grange, and the hamlet of Sneyd, in adjacent pars., being, in fact, co-extensive with the district termed the Potteries. It has an entire area of about 16,000 acres, and a pop., in 1831, of nearly 51,000, and in 1841 of about 70,000. Stoke-upon-Trent is lighted with gas, and well supplied with water. The old parish church being much decayed, a new and handsome church was erected in 1826, partly by subscription among the inhabs. In it has been placed a bust of the great founder of the earthenware manufactory, the celebrated Josiah Wedgwood, who died in 1795, and who was admirable alike for the improvements he introduced into the fabric of the ware, and for the classical elegance and purity of his designs. The living, a very valuable rectory, being worth 2,717*l*. a year nett, is in the gift of J. Tomlinson, Esq. It has, also, chapels for various dissenting sects, and a large national school. The Trent and Mersey canal passes through Stoke par., and on its banks are numerous wharfs for shipping the earthenware, which is the great, and, indeed, almost the only product of this district. The contributory townships of Burslem and Hanley have been already noticed. (1. 447. 960.) The towns now included within the district called the Potteries have almost all risen to importance since about 1760, when Wedgwood commenced his career. The Reform Act erected it and the districts specified above into a par.

bor., and gave it the privilege of sending 2 mems. to the H. of C. Registered electors, in 1839-40, 1,623. The smallness of this number, as compared with the pop., is a consequence of the low value of houses in the district. "The cheapness of building materials, and the abundance of building ground, render a house rented at somewhat below 10*l*. sufficient for the wants not only of the higher order of mechanics, but even of many other classes. This low rate of house-rent does not arise from a depression of trade and wages: no place that we have visited appears in more full employment, more prosperous, or more steadily advancing in improvement, than this important district." (*Bound. Report*.)

The towns and villages comprised in the Potteries, or in the par. bor. of Stoke-upon-Trent, are so near each other, that their limits are not easily defined, and to a stranger the entire district has the appearance of a large straggling town. A very large proportion of the pop. is engaged in, and a still greater is dependent for support on, the manufacture. With the exception of the gold used in gilding, most of the materials employed are worth very little; so that the value of the finished articles, as well as their exquisite beauty, and adaptation to every purpose of utility and ornament, is mainly ascribable to the skill and labour expended upon them. The wives and children of the workmen are usually employed; and though they work together in factories, yet, as they reside in separate cottages, the manufacture partakes largely of the domestic character. The wages of a whole family amount to a very considerable sum. "The noxious process of glazing, so injurious to the health of those employed, has been rendered nearly free from its deleterious effects by the substitution of boracic acid for lead, which was formerly wholly used, but now only in the proportion of 8 per cent. The people employed in that branch were formerly not admissible into clubs, and were considered as degraded objects from the insalubrity of their employment; but they are now gladly received into benefit societies." (*First Factory Report*, b. ii. p. 78.) At present (1841) the Potteries are rather in a depressed condition; but, speaking generally, the work-people have a healthy comfortable appearance. The Sunday-schools in the district are extremely well attended. (*Statistics of the Brit. Emp.*, i. 712, 2d ed.)

**STONE**, a market-town and par. of England, co. Stafford, hund. Pirehill, on the Trent, and on the high road from London to Liverpool, 20 m. N.W. Lichfield. Area of par., 20,030 acres. Pop., in 1831, 7,908. The town consists principally of two streets crossing each other, and is pretty well built. The par. church is a modern structure, with a low square tower; the living, a perpetual curacy, worth 2144*l*. a year, is in the gift of the crown. Here are chapels for Independents, Wesleyans, and R. Caths.; with a free school founded in 1558, and other charitable endowments. The Trent and Mersey Canal passes through the town, the inhab. of which are principally engaged in the manufacture of shoes. Petty sessions are held here every fortnight. Stone is supposed to owe its origin to a monastery founded in 670, afterwards made subservient to that of Kenilworth. Market days, Tuesdays: 4 cattle fairs are held yearly. Meaford, in Stone par., was the birth-place of Sir John Jervis, afterwards Earl St. Vincent, from his great victory over the Spanish fleet, off Cape St. Vincent, on the 14th Feb., 1797.

**STONEHAVEN**, a bor. of barony, sea-port, and market-town of Scotland, co. Kincardine, of which it is the cap., on the German Ocean, at the point where two small rivers, the Carron and Cowie, fall into a small bay, flanked on both sides by lofty rocks, 14 m. S. by W. Aberdeen. Pop., in 1831, 3,050. It consists of two parts: the old town, on the S. side of the Carron, is irregularly and badly built; but the new town, on the N. bank of the river, on the estate of Mr. Barclay of Ury, which has rapidly grown up, is comparatively well built and handsome: it consists of two parallel streets and cross streets, with a large square in the centre, and is far superior, in wealth and pop., to the other. The two towns are connected by a handsome stone bridge. The parish churches of Dunottar and Fetteresso are in the immediate vicinity of the town, which has also two chapels, belonging respectively to the Episcopalians and Seceders. Exclusive of other seminaries, the town has a free school for the education of 60 poor children. The harbour, which is a natural basin, has been a good deal improved by the erection of piers, and affords a safe refuge for the smaller class of vessels.

The inhab. engage to some extent in the herring and haddock fisheries, having, in 1839-40, had 172 boats employed in this department. It has a flax and a woollen mill, but neither is of considerable size, and two branch banks. The trade of the town is inconsiderable.

Dunottar castle, about 2 m. S. from the town, stands on a lofty peninsular rock, projecting into the sea, being separated from the mainland by a vast chasm or natural fosse. The summit of the rock, which is mostly

occupied by the ruins of the castle, comprises about  $1\frac{1}{2}$  acres. This castle was, for a lengthened period, the property and residence of the noble family of Keith, Earls Marischal. It was forfeited and dismantled after the rebellion of 1715, on the attender of its noble proprietor. Owing to its position, it was formerly a place of considerable strength, and has been repeatedly besieged. (*Municipal Boundary Report; Pennant's Scotland*, iii. 150.)

STONEHENGE, the name given to a gigantic ruin, consisting of vast stones, partly upright, and partly fallen, on Salisbury Plain, co. Wilts. England, 2 m. W. Amesbury, and 7 m. N. Salisbury. Though its present appearance be that of a confused mass, justifying, in some degree, Camden's epithet of *insana substructio*, it is seen, on a little examination, that its original form, which may be easily traced, was circular. When perfect, it had consisted of two outer concentric circles of stones, with two inner groups of stones. The outer circle, the diameter of which was 100 ft., appears to have originally consisted of 30 upright stones, of which 17 are still standing. Their average height is about 14 ft.; and their sides 7 ft. by 3 ft. Each of these upright stones has tenons on its upper end, on which were placed horizontal stones or imposts, with mortices to correspond with the tenons; and these imposts being connected together, formed a continuous circular architrave all round the fabric. The inner circle, 8 ft. 3 in. within the outer circle, consists of smaller stones, more irregularly shaped than those in the outer circle, and without imposts. Only 8 stones of this circle are now standing; but there are remains of 12 others on the ground. Within the inner circle are 2 groups of stones, having between them a large flat stone, called the *altar*. Some of these interior stones are of vast size, and have imposts similar to those of the outer circle. According to what appears to be the most accurate calculation, Stonehenge, when entire, must have comprised, in all, 125 or 130 stones. They consist mostly of a fine, white, compact sandstone, closely resembling, or rather identical with, the grey-weathers and other detached masses of stone scattered over the surface of the downs in the vicinity of Avebury and Marlborough.

This gigantic structure is surrounded by what must originally have been a deep trench, about 30 ft. in breadth; and connected with it are an avenue and *cursus*. The former, a narrow road of raised earth, extends in a direct line from what is supposed to have been the grand entrance to the structure, a distance of 561 yards, when it divides into two branches, one leading to a row of barrows, and the other to the *cursus*, an artificially formed flat tract of ground. The latter,  $\frac{1}{4}$  m. N.E. from Stonehenge, is bounded by parallel banks and ditches, measuring 3,036 yards in length, by 110 yards in breadth.

Such is a brief notice of this stupendous monument, and of its principal appendages. Similar remains are found at Avebury, in the vicinity, and in various places in Britanny, the Orkney Islands, &c. Conjecture has exhausted itself in vain, though frequently ingenious, attempts to explain the origin and use of this wonderful fabric, and others of its class. The most common opinion is that it was raised by the ancient Britons for a druidical temple. We have elsewhere (*see* AVEBURY, I. 255.) stated our reasons for believing the statement of its having been connected with the worship of the druids as altogether unfounded; and there is no evidence to show that the ancient Britons raised or could raise so extraordinary a structure. In truth, we know nothing of this and the other monuments of the same kind, beyond the fact of their existence. They belong to a period of which all records have irretrievably perished; and it is extremely improbable that the vell by which their origin, and the purpose of their founders, is now hid, should ever be drawn aside. Inigo Jones, the learned Dr. Stukely, Dr. Smith, Sir R. C. Hoare, Gough, in his ed. of Camden, &c., have given descriptions of Stonehenge. A good account of the ruins, with a view of the different theories as to the origin and purpose of the structure, may, also, be found in *Keble's Cyclopædia*.

STONEHOUSE. See PLYMOUTH.

STORNOWAY, a bor. of barley, sea-port, and market town of Scotland, on the E. side of the island of Lewis, one of the Hebrides (which see), on a fine bay, 36 m. W. by N. from the nearest point of Cromarty, on the main land, lat.  $58^{\circ} 13' N.$ , long.  $6^{\circ} 16' W.$  Pop. of the town and immediately contiguous villages, about 3,000. This, which is the most considerable town in the Western Islands, has grown up, within no very long period, from a paltry hamlet of about a dozen houses, in consequence of its favourable situation for carrying on the herring and cod and ling fisheries, especially the latter. Though not regularly built, the houses are substantial, and slated, and there are some good shops. The harbour is formed by a pier; and the bay, which is spacious, and has deep water, is formed by two low headlands and an island. Seaforth Lodge, the occasional

residence of Mackenzie of Seaforth, proprietor of the island of Lewis, is in the immediate vicinity of the town. There is a parish church, town-house, and custom-house, the gross revenue collected at the latter in 1840 being 646*l*. There is no prison in the island. Though many of the people are Roman Catholics, there is not a single Protestant Dissenter. The means of education, which formerly were very deficient, have been increased materially of late years. Gaelic is the language generally spoken throughout the island; in Stornoway, however, it is giving way to English, and divine service is now performed one part of the day in Gaelic, and the other in English.

Small packets, supported by government, ply weekly between Stornoway and Pollow, on the coast of Ross; and in summer Stornoway is sometimes visited by steamers from Glasgow.

The herring fishery has latterly declined; but during the year ending the 5th of April, 1840, 15,810 cwts., or 790 tons, cod and ling were sent out from Stornoway and Barra; it may be worth from 12*l*. to 15*l*. a ton. During the same year 574 boats, manned by 3,336 men and boys, were fitted out from the same places for the fishery. The town has a branch bank, and a rope manufactory.

With the exception of a small district immediately around Stornoway, the island of Lewis is in the most backward state imaginable, and the inhab. poor and wretched in the extreme; nor, owing to the embarrassments of the present proprietor, is there much prospect of any speedy change for the better. (*New Statistical Account of Scotland, Ross, and Cromarty*, 115, 140; *Anderson's Guide to the Highlands*, 482, &c.)

STOURBRIDGE, a market-town of England, co. Worcester, hund. Halfshire, par. Old Swinford, on the Stour, here crossed by a stone bridge, 18 m. N.N.E. Worcester. Pop. of township in 1831, 6,148. Though irregularly built, the houses are pretty good; it has a handsome market-house, a theatre, a subscription library, &c. The episcopal chapel, erected by subscription in 1742, is beyond the jurisdiction of the bishop; the living, a curacy, in the gift of the inhab. householders, is worth 134*l*. a year. There are places of worship for various sects of Dissenters, and a well-endowed free school, founded by Edw. VI., in which Dr. Johnson received the rudiments of his education. Stourbridge has a national school, and a great number of benevolent and benefit associations. It is governed by a bailiff, town-clerk, &c.; and has petty sessions, and a court of requests. It has manufactures of glass and earthenware, and hardware; the iron trade of the town and neighbourhood is considerable, and most part of the iron-work used in the construction of the custom-house and new post-office, London, came from Stourbridge. The town communicates, by a branch canal, with the Staffordshire and Worcestershire Canal; by which great numbers of bricks are sent hence to the metropolis, and elsewhere. Markets on Fridays. Fairs, Jan. 8. and Mar. 29., for horses and cattle; Sept. 8., for cattle and sheep.

STOURPORT, a market-town of England, co. Worcester, hund. Halfshire, par. Kidderminster, at the confluence of the Severn and Stour,  $\frac{3}{4}$  m. S.W. Kidderminster, with the pop. of which town and par. its own is returned. It is wholly of modern date, owing its origin to the Staffordshire and Worcestershire Canal, which joins the Severn on its S. side. It is well built, principally of brick, and is partially paved, and lighted with gas. The Severn is here crossed by an iron bridge, the central arch of which has a span of 150 ft., rising to 50 ft. above the surface of the river. Stourport has an extensive transit trade, being, in fact, one of the principal *entrepôts* between the E. and W. parts of the kingdom. Markets on Wednesdays; fairs, Easter Monday, Sep. 15., Dec. 18., chiefly for hops and cattle; also a meeting every Thursday, for hops.

STOW-MARKET, a market town and par. of England, co. Suffolk, hund. Stow, on the Gipping, a tributary of the Orwell, and on the road and half way between Ipswich and Bury. Area of par., 1,240 acres. Pop. in 1831, 2,672. The town consists principally of a main street, with many good houses, and a building and thriving appearance. The par. church is large and handsome, part of it being in the decorated, and part in the perpendicular style (*Richman*): it has a tower and slender spire of considerable height, a peal of 8 bells, &c. The living, with that of Stow-Upland, adjacent, a vicarage worth 281*l*. a year, is in the gift of — Wilcox, Esq. (*Eccle. Rev. Rep.*) The Baptists, Methodists, &c., have meeting-houses, and there are various schools and benevolent societies. Stow-market is connected by a navigable canal with Ipswich, and has a brisk trade in malt and barley, with manufactures of cordage and sackings. Near it is the house of industry for the hund., a handsome edifice on an eminence, erected at an expense of 12,000*l*. It has petty sessions, a manorial court, &c., and is a polling-place for the W. div. of the co. Markets on Thursdays; fairs, three times a year.

ST. AP ANE, an inland town of Ireland, W. side co.

Tyrone, prov. Ulster, on the Mourne, near its confluence with the Finn or Foyle, 1 m. E. Lifford, and 14 m. S. S.W. Londonderry. Pop., in 1836, 5,147. It is built on the estate of the Marquis of Abercorn, in a fine valley enclosed by lofty mountains; and has a good linen market, an extensive retail trade, and a considerable trade in the export of grain and provisions, by way of Londonderry. The older parts of the town, along the river, are low, with narrow dirty streets and mean houses; but in the newer parts there are some comparatively good streets, shops, and houses. It has a par. church, a R. Catholic chapel, two Presbyterian and two Methodist meeting-houses, a fever hospital and dispensary, a market-house and a sessions-house, and a bridewell. It is connected by a bridge with its suburb on the left bank of the river. Under the Municipal Reform Act (3 and 4 Victoria, cap. 108.), it has a corporation entitled the sovereign, free burgesses, and commonalty. Previously to the Union it returned 2 mems. to the Irish H. of C., but was then disfranchised. It has a par. school, a Lancasterian do., and some other schools. The trade of the town is much facilitated by a canal, about 4 m. in length, from it to where the Foyle becomes navigable for barges of 40 tons. (*Railway Report, &c.*)

Quarter sessions are held in April and October, petty sessions on alternate Tuesdays, and a mayor court, with jurisdiction to the amount of 2*l.*, is held once a month. Adjoining the town is a valuable salmon fishery, the produce of which is mostly sent, either fresh, packed in ice, or pickled, to the British markets. Post-office revenue in 1830, 1,158*l.*; in 1836, 1,258*l.* Branches of the Agricultural, Provisional, and Belfast banks were opened in 1835. "I saw little or nothing of rags in Strabane; there was a respectable look about the people and every thing else." (*Anglia's Ireland*, ii. 187.) Persons coming to attend the assizes for the co. Donegal, held at Lifford, usually take up their residence in Strabane.

STRALSUND, a strongly fortified town of the Prussian states, prov. Pomerania, cap. reg. and circ. of the same name, on the narrow strait separating the Isle of Rugen from the continent, lat. 54° 19' 28" N., long. 13° 7' 20" E. Pop. (1841), 11,713. It was founded in 1209. Streets narrow and dirty, houses ill-built; but it has a fine arsenal, and some good public buildings. It is encompassed on the land side by lakes and marshes, so that it can only be approached by bridges. Its fortifications, which had been dismantled, have been renovated and greatly improved since 1815, so that it is now one of the strongest places in the monarchy. It has a gymnasium, two public libraries, and an orphan asylum, with breweries, distilleries, and various manufactures; and carries on a considerable commerce, exporting corn, timber, beer, linens, &c. Its port, though small, is convenient and safe, but it labours under a deficiency of water. Close to the town the depth does not exceed 7 feet, at a little distance it increases to 10 feet, and in the offing there is 13 feet. In 1761 there belonged to Stralsund 72 ships, of the burden of 6,861 lasts.

STRANRAER, a par. and royal bor. and sea-port of Scotland, co. Wick, on the flat ground on the inner or S. shore of the inlet of the sea called Loch Ryan, on the high road from Dumfries to Portpatrick, 21 m. W. by N. Wigtown. Pop. of royal bor., in 1841, 3,439; but the par. bor., which includes some contiguous suburbs, had then a pop. of 4,859. It consists of three streets parallel to the shore, united by several cross streets. The principal streets are neat, and pretty well built; but there are a great many wretched hovels in the lanes and outskirts of the town, mostly occupied by Irish immigrants. It has a town-hall, gaol, a church belonging to the establishment, with various dissenting chapels, 1 parochial and 7 unendowed schools, 2 very good subscription libraries, and a good public reading-room. It is the centre of a considerable retail trade; but has no manufactures, except some hand-loom weaving, on account of the Glasgow manufacturers. It has three branch banks, a savings' bank, and a weekly newspaper. Loch Ryan, is a fine basin, opposite to a place called Cairn, on its E. shore, there is good anchorage, and water sufficient to float the largest ships. Stranraer harbour dries at low water; but it would not be difficult, by carrying out the pier to a greater distance into the loch, to make it accessible at all times of the tide. In 1840, 36 vessels belonged to the port, of the aggregate burden of 2,039 tons. Its customs revenue is inconsiderable, and inadequate to defray the cost of the establishment. Steamers regularly ply between the port and Glasgow and Belfast. A large proportion of the pop. are Irish, mostly in an abject state of poverty. Stranraer was made a royal bor. in 1617. It has 18 councillors. Corporation revenue, in 1840, 2,771*l.* It unites with Wigtown, Whithorn, and New Galloway, in sending 1 mem. to the H. of C. Registered electors, in 1839-40, 220. (*New Statistical Account of Scotland*, No. XXI. 94.; *Official Returns*; and *Private Information*.)

STRASBOURG (an *Argentoratium*), a fortified city of France, on its E. frontier, dep. Bas-Rhin, of which it

is the cap. on the Ill, within a short distance of the Rhine, to which its glacis extends, and across which it communicates with Kehl by a bridge principally of boats, about 100 m. S. S.W. Mentz, and 250 m. E. by S. Paris; lat. 48° 34' 56" S., long. 7° 44' 51" E. Pop., in 1836, 50,239 (many of whom are Protestants and Jews), exc. the garrison, generally amounting to 6,000 men. The city is of a triangular form, is enclosed by a bastioned line of ramparts strengthened by numerous outworks, entered by 7 gates, and has on its E. side a strong pentagonal citadel, built by Vauban. By means of sluices constructed under Louis XV., the adjacent country may be laid under water; and several additional defences having been constructed since the peace, it is now one of the most important fortresses and arsenals in France, and has the largest *dépôt* of artillery. Strasbourg is agreeably situated, and generally well laid out: its streets are mostly narrow, with lofty houses; but it has several rather large and regular squares. Though for a lengthened period united to France, it still has all the outward appearance of a German town, with which the costume and language of its inhabs. correspond. The Ill and its branches intersect the city in all directions, and are crossed by numerous wooden bridges. Without the walls are several suburbs.

By far the most remarkable public edifice is the minster, or cathedral, one of the noblest of any of its kind. It is said to have been originally founded by Clovis, in 501; but Charlemagne constructed the choir, the only part that survived the destruction of the old cathedral by lightning in 1007. The modern building was begun in 1015, but not finished till the 15th century. The entire length of the interior is 378 ft.; breadth, 140 ft.; height from the pavement to the roof of the nave, 76½ ft. The W. or grand entrance has, on its N. side, a spire, of the extraordinary height of 437½ Paris, or 465½ Eng. ft. (*Schreiber*); being, if the dimensions be accurate, about 7 ft. higher than St. Peter's in Rome, and about 5 ft. higher than the great pyramid of Cheops. It is of open work, and combines with the most perfect solidity extraordinary lightness and elegance. The view from the top of this spire is one of the most extensive and finest that can be imagined. It is, however, enjoyed by few only. The ascent to the top of the tower may, indeed, be accomplished without much difficulty, and the view from it is superb; but the ascent thence to the lantern requires very powerful nerves, and, in fact, ordinary visitors are not permitted to attempt it. The erection of this famous spire was commenced in 1276, by Erwin de Steinbach, and continued by his son, his daughter Sabina having also contributed some fine sculptures to the principal portal. It was finished in 1439, under the direction of Schulz, an architect of Cologne. Beside the grand portal are equestrian statues of Clovis, Dagobert, Rodolph of Hapsburg, and Louis XIV.; and over its centre is a margold-shaped window of stained glass, 51 ft. in diameter. The interior has a fine stone carved pulpit, with numerous monuments, statues, &c. The famous astronomical clock, constructed by Isaac Habrecht, which indicated the days of the month, the places of the sun and moon, and other celestial phenomena, has been standing still for a considerable number of years. Napoleon is said to have contemplated the repair of this curious piece of mechanism. In the church of St. Thomas is the magnificent monument in honour of Marshal Saxe, the *chef-d'œuvre* of Pigalle. Here, also, is a monument to Koeh, the historian. The *Temple Neuf*, given, in 1681, to the Protestants in exchange for the cathedral, the church of St. William, the *Château Royal*, the large public library, said to contain (though we do not place implicit confidence in the statement) 130,000 vols., the new synagogue, the theatre (with a handsome front of six Ionic columns), the prefecture and other public residences, the arsenal, barracks, custom foundry, and other military establishments, and various public schools, are deserving of notice. There are several hospitals and asylums, civil and military prisons, an exchange, corn, fish, and other markets, various assurance companies, a royal *dépôt d'étalons*, a botanic garden, &c. The environs are well cultivated, and Strasbourg has many good public walks; the principal of which is the *Coteaux*, without the city, laid out by the marshal of that name in 1764.

Strasbourg is a bishop's see, the seat of a court of primary jurisdiction, council of *prud'hommes*, and a chamber of commerce; of a university academy, royal college, mint, boards of forest economy, roads, and bridges, and of customs; the Lutheran consistory for the S. of France, faculties of law, medicine, sciences, &c., R. Cath. and Protestant seminaries, and societies of agriculture, literature, and arts. The museum of the academy is very rich in the natural products of Alsace. The city is divided into four cantons, in each of which is a justice of the peace and a police commissary. It has an extensive royal manufactory of snuff, for which Strasbourg is famous; with considerable manufactures of woollen, linen, and cotton stuffs, sail-cloth, cutlery, steel

articles, metal buttons, cotton twist, leather, hats, paper, playing cards, earthenware, shell articles, printing types, chemical products, &c., exclusive of dye-houses, breweries, printing establishments, and sugar refineries: the *pâtés de foies gras* of Strasbourg have attained to high gastronomic celebrity. The trade of Strasbourg is very extensive, its situation on the Rhine having rendered it a great frontier entrepôt.

Strasbourg is very ancient, and most probably, indeed, existed previously to the Romans. It assumed the name of *Strateburgum* in the 6th century. On the first partition of the Frankish territory it was included in the kingdom of Austrasia, and on the second in Lorraine. In the 10th century it belonged to the German emperors, and subsequently became a free city of the empire, which it continued to be till 1681, when it was taken possession of by Louis XIV., and finally annexed to France. Pierre Schæffer, who contests with Gutenberg the honour of being the inventor of printing, and Generals Kellermann and Kleber, are among the distinguished natives of Strasbourg. The latter is buried in the cathedral, and a monument has been erected to his memory on the artillery parade. (*Hugo, art. Strasbourg; Schröder, Guide du Rhin; Guide du Voyageur en France; Murray's Handbook, &c.*)

STRATFORD-UPON-AVON, a town, mun. bor., and parish of England, co. Warwick, hund. Barlich-way, celebrated as the birth-place of Shakspeare, 7 m. S.W. Warwick. Area of par., 6,860 acres. Pop., in 1831, 5,171. The town is finely situated on a gentle acclivity rising from the W. bank of the Avon, which here expands to a breadth of about 130 yards, and is crossed by a bridge of 14 arches, built in the reign of Henry VII., but repaired and widened in 1814. In the older parts the houses, though intermixed with others of more modern date, have an antique appearance; several new streets have, however, been constructed of late years, and the corporation has distinguished itself by the aid it has given to improvements of all sorts. (*Municipal Bound. Report.*) It has a large, handsome, cruciform church, with a square embattled tower, surmounted by a lofty spire; the transepts, tower, and some parts of the nave, are early English; the rest of the building is mostly a mixture of decorated and perpendicular. (*Tickman.*) It has several fine old monuments. Of these the most interesting by far is that of Shakspeare, on the N. wall of the chancel. It is constructed partly of marble, and partly of stone; consisting of a half-length bust of the poet, with a cushion before him, placed under an ornamental canopy, between two columns, supporting an entablature. Under the bust are the following lines:—

Jadis en Pyllum, genio Secretum, arte Maronem,  
Terra tunc, populi macie, Olympe, habit.

These are followed by six lines in English verse; and on a flat stone, which covers the grave, is an entreaty not to disturb the dust "enclosed here," and an imprecation against such as might profane the ashes of the mighty dead.

The living of this church, a vicarage, worth 239*l.* a year, is in the gift of the Earl of Plymouth. Here is also a chapel, that once belonged to the guild of the "Holy Cross," suppressed at the Reformation: it is of the age of Henry VII., in the perpendicular style, and has several curious fresco paintings on its walls. Attached to this building is a hall for the brethren of the guild, since used for the meetings of the corporation; almshouses for 24 poor persons of both sexes, and a free grammar-school for children, natives of the bor. The modern town-hall, a building of the Tuscan order, erected in 1768, has a hall 60 ft. in length by 30 ft. in breadth. Having been dedicated, at the jubilee in 1769, to the memory of Shakspeare, it is thence called the Shakspeare Hall. It is decorated with pictures, by Wilson and Gainsborough, of the great poet and Garrick; and outside the building is a statue of the poet, which, with the pictures, was presented by Garrick. Here are national, Lancastrian, and other schools, 2 public libraries, a neat theatre, &c. The *Mun. Corp. Report* says that some of the charities in the town are highly spoken of. The town is governed by a mayor, 3 aldermen, and 12 councillors, but has no commission of the peace; and even its court of record has fallen into disuse. Corp. revenue, in 1840, 2,194*l.* The only manufacture carried on belongs to one of the departments of button-making, and it is by no means extensive. Markets on Fridays; fairs 6 times a year, for cattle, corn, provisions, &c. The Avon is navigable by barges from the Severn to Stratford, where it unites with the Stratford Canal, which is itself connected with the Worcester and Birmingham Canal.

Little, unfortunately, is known of the life of the illustrious poet to whom Stratford owes all her celebrity. He first saw the light on (as is supposed) the 23d of April, 1564. Having married in 1582, he soon after went to London, where he produced the greater part of his immortal works; and having returned to Stratford to spend the evening of his days, died there in 1616, on the

23d of April, the anniversary of his birth. This brief notice comprises nearly all the authentic information we possess regarding the greatest of dramatic poets, notwithstanding his death occurred little more than two centuries ago! "No letter of his writing; no record of his conversation; no character of him, drawn with any fullness by a contemporary, can be produced." (*Hallam.*)

The house in which the great poet was born, in Henley Street, is still standing; and is the resort of all visitors to the town. It has, however, been converted into two houses, and otherwise much altered. The house in which Shakspeare passed the latter years of his life was, to the disgrace of those concerned, demolished in 1759; when the famous mulberry-tree he is said to have planted in its garden was also cut down! (*Wheler's Stratford-on-Avon; Municipal Boundary Report, &c.*)

STRAFORD (STONY), a market town and par. of England, co. Bucks, hund. Newport, on the Ouse, which is here the boundary of the co., and is crossed by a stone bridge, 64 m. N.E. Buckingham. Area of par., 70 acres. Pop. in 1831, 1,653. It is built on the line of the ancient Watling Street, and is supposed to occupy the site of the *Lactoranum* of the Romans. The houses are mostly of freestone, extending for about 1 m. on either side the road. The parish church was rebuilt in the Gothic style, in 1777; the living, a perpet. curacy, worth 130*l.* a year, is in the gift of the Bishop of Lincoln. There are meeting-houses for various dissenters, national and Sunday schools, a society for apprenticing children, &c. At an inn in this town, the person of the young king Edward V. was seized, and Grey and Vaughan arrested by Richard duke of Gloucester. The only manufacture is that of lace; but the inhab. have some trade in corn. Markets, which are well supplied with provisions, are held on Fridays: fairs, 21st Aug., and Friday before 10th Oct., for hiring servants; and 12th Nov. for cattle.

STROUD, a m. bor., market-town, and par. of England, co. Gloucester, hund. Bisley, on the Slade or Stroud-water, near its junction with the Frome, 9 m. S. Gloucester. Area of par., 3,990 acres. Pop., in 1831, 8,607; in 1841, 8,680. The par. bor., however, is not confined to the town, but includes the whole clothing district, of which it may be regarded as the centre, comprising about 14 parishes. The general characteristics of the district are, "the situation of the mills on streams in deep ravines; the scattered and irregular manner in which the houses are built on the hill sides; and the contrast between the high land (in many cases either wood or common, with few inhab.) and the valleys studded with houses and thickly peopled." (*Parl. Bound. Report.*)

Stroud stands on the side of a hill, and consists chiefly of a long street, crossed by another at its base: the houses are good, and the streets well paved and lighted. The parish church, a large edifice, has a tower with an octagonal steeple at its W. end. The living, a perpetual curacy, worth 132*l.* a year, is in the gift of the Bishop of Gloucester. There are places of worship for Baptists, Independents, Wesleyans, &c.; and several charities for educating poor children, and giving relief to the poor.

Stroud, and the district of which it is the centre, owes much of its prosperity to the Stroud-water, which is not only made available for the working of machinery, but is said to be peculiarly adapted to the dyeing of scarlet and other colours. The clothing trade has, in consequence, extended itself principally along the banks of the river, on which there are numerous fulling-mills, &c. In 1838, there were 14 mills in Stroud par., about half impelled by water and half by steam, which employed together 1,299 workpeople. (*Mills and Factories Rep.*)

The prosperity of the town and district depends, of course, upon the state of the clothing trade, and partakes of the fluctuations incident to the latter. Power-looms have begun to be introduced into the manufacture, but hitherto they have not made much progress. The Thames and Severn Canal, which passes close to the town, is of great advantage to its trade.

The Reform Act conferred on Stroud, and its adjacent district, as specified above, the important privilege of sending 2 mems. to the H. of C. Registered electors, in 1839-40, 1,202. Petty sessions for the hund. are held in Stroud. Markets, on Fridays: fairs, May 10. and Aug. 21, for cattle, sheep, and hogs.

STUHLWEISSENBURG, a town of Hungary, cap. co. of its own name, 18 m. N.E. Lake Balaton, and 35 m. S.W. Buda. Pop., with its two suburbs, 20,000. (*Bergheus.*) "Though formerly a Roman town, and a name of frequent occurrence in Hungarian history, it contains nothing remarkable. The palace of the bishop, and some of the buildings connected with it, are handsome; but the streets are badly paved, and the whole town disagreeably placed in the centre of a huge bog." (*Page's Hungary, i. 257.*) It was, for a lengthened period, the residence of the sovereigns of Hungary, and has a royal mausoleum, in which 14 of them are buried. It has a gymnasium and other H. Cath. schools a military academy.

demy, a Magyar theatre, &c.; with manufactures of woollen cloth, dannel, soap, and leather. (*Austr. Nat. Encyclop.*, &c.)

**STUTTGARD**, a city of S. Germany, cap. of the kingdom of Württemberg; on the Nesen, a small tributary of the Neckar, about 14 m. from its embouchure in that river, 35 m. S.E. by E. Carlsruhe, and 120 m. N.W. Munich. Lat. (of the gymnasium)  $48^{\circ} 46' 32''$  N.; long.  $9^{\circ} 10' 48''$  E. Pop., including some suburban villages, about 34,500. (*Berghaus*.) It is situated in an amphitheatre of fertile hills; and having been, for the most part, laid out during the present century, is one of the cleanest and handsomest towns of Germany.

"The approach of Stuttgart is exceedingly pretty. The road passes through an avenue of lofty poplars, and you enter the broad and handsome *Neckar Strasse*, without encountering any of those disagreeable or vulgar appearances that frequently distinguish the suburbs of a capital. The city may be said to stand in the centre of a garden: on every side it is surrounded by vineyards and orchards. In the ancient part of the town, the streets are narrow and crooked; but in the modern, they are broad and handsome. The court and the military, with the other necessary concomitants of a capital, give it rather a lively air; and there is usually a great bustle in the streets." (*Strang's Germany* in 1831, li. 394.) Other travellers say that it is very dull, presenting little to interest a stranger; and that, like most other capitals of petty states, it has a parade of importance, to which it is really not entitled. It has also been evidently a mistake to plant the city on the dirty and stagnant Nesen, instead of the Neckar, a fine navigable stream, which might have opened for it a considerable traffic to and from the Rhine. And from being placed in a deep hollow, it is in winter, according to Spencer, enveloped in mists and fogs, while in summer it is unhealthy from malaria. (*Germany and the Germans*, li. 337.)

The new royal palace has the advantage, if such it be, of being situated both in town and country: opening on one side into a fine park, and on the other into a spacious square, planted with trees and fronting the *Königs Strasse*, or King's Street, the finest in the city. The palace is an imposing freestone edifice, begun in 1746, and completed by the late king. It has a centre and two projecting wings; the whole forming, like Buckingham Palace, three sides of a square. The parapets are decorated with handsome statues; but the roof immediately above the grand entrance is surmounted, we cannot say adorned, with a large gilt crown, cushion, &c. The same bad taste does not prevail in the interior, though even there ostentation and costliness are every where visible. (*Autumn near the Rhine*, p. 316.) There are a vast number of apartments, and several are fitted up with splendid tapestries, from the Gobelins at Paris, presents from Napoleon to his ally the late king. Besides which, the palace contains many good Flemish paintings and sculptures by Danneker and Canova. In the same public square in which the new palace is situated are the old palace and the theatre. The former, now occupied by the officers of the court or government, has the aspect of a feudal fortress; and behind it is a Gothic church, in which are monuments of the Dukes of Württemberg. The theatre is merely a wooden building; but it has usually a good company.

Some other buildings are worthy of notice; as the palaces of other members of the royal family, the *Ständehaus*, or chamber of the parliament of Württemberg, to the debates and divisions of which the public are always admitted; the city county-house, chancery court, new barracks, post-office, royal and city schools, large hospital, workhouse, royal stud-house, adjoining the palace, with an extensive stud of fine horses, royal stables, and riding-school, &c. Stuttgart has 6 Lutheran churches, a Calvinist and a Rom. Cath. church, and a synagogue. The public library, open daily from 9 to 12, and from 3 to 5, a very large and valuable collection, comprises from 170,000 to 180,000 vols., including a magnificent collection of Bibles. The museum of natural history comprises a remarkable collection of fossils found at Kannstadt. There are royal cabinets of medals, antiquities, models, maps, charts, &c., and many private libraries and collections. Without having the pretensions of either Munich or Dresden, to be considered a seat of the fine arts, Stuttgart has been distinguished as the birth-place or residence of several of the most eminent German literati and artists; as Schiller, Danneker, Menzel, long the editor of the *Literatur-Blatt*, Baron Cotta, the famous publisher, &c. Many of Danneker's finest works are in this city, and here Schiller wrote his *Robbers*. Stuttgart is an industrious town, though unfavourably situated for trade. Cotta's publishing establishment is one of the most extensive on the Continent. Next to printing and bookbinding, the weaving of woollen and cotton goods, and the making optical, mathematical, and musical instruments, are the chief branches of manufacturing industry. Some agreeable effervescing wine is

made on the surrounding hills; and about 3 m. N.E. the city is Kannstadt, resorted to by the citizens and others as a favourite watering-place.

Stuttgart suffered severely in the wars of the 16th and 17th centuries; but it escaped with little loss during the last war, though repeatedly occupied by the armies on both sides. (*Berghaus*; *Memminger, Beschv. von Württemberg*; *Strang*; *Spencer*; *Murray's Hand-book for S. Germany*, &c.)

**SUDBURY**, a parl. and mun. bor. of England, principally in the co. Suffolk, but partly also in Essex, on the Stour, here crossed by a stone bridge, 18 m. W. Ipswich, and 50 m. N.E. London. The parl. bor. includes the three pars. of St. Peter, St. Gregory, and All Saints, and some small extra-parochial districts on the Suffolk side of the river, with the hamlet of Ballingden-cum-Brunden, in Essex: its area may amount, in all, to about 2,100 acres, and it had, in 1831, a pop. of about 5,500, of which 4,677 belonged to the old bor. "The town of Sudbury lies towards the S. extremity of the bor. It is a neat, clean, and well-built town. Under the provisions of a local act, it is lighted, the footpaths flagged, and the roads kept in repair: it is also watched occasionally. The town has been much improved of late years internally, but the buildings have not extended beyond its former limits, and, indeed, this cannot occur; for the lands immediately surrounding the town, which are adapted for this purpose, are subject to a right of common pasture during part of the year. It is said, that if this right could be abolished, the buildings would probably increase." (*Mun. Corp. Rep.*) Sudbury has 3 churches, All Saints, St. Gregory, and St. Peter; mostly in the perpendicular style, but some of the tracery, and other parts, have been much mutilated. (*Rickman's Gothic Arc.*) The living of All Saints, a vicarage, worth 119*l.* a year, is in the gift of — Sperling, Esq.; those of St. Gregory and St. Peter, curacies, worth 160*l.* a year, are in the gift of Sir L. Maclean. Except a large Independent chapel and a Baptist chapel, there are few or no other buildings worth notice; and no remains exist of the Benedictine priory, founded in the reign of Henry II. The grammar-school, founded in 1491, has an income of about 100*l.* a year; and there are various other charities, including a national school, at which about 150 children attend; but the education of the poorer classes here is said to be very defective.

Sudbury was one of the towns in which the immigrant Flemish woollen manufacturers were established by Edward III. Its woollen trade has, however, been for many years nearly discontinued, though, luckily, it has been replaced by that of silk. In 1838 there were estimated to be about 600 looms in the town; of which 270 were wrought by men, 250 by women and girls, and 80 by boys. They were then, however, little more than half employed. Mantels, lutes, and gros-de-Naples are the articles principally manufactured. Jacquard looms are not very generally introduced. The Sudbury weavers are said to be less expert in making fine goods than the weavers in Spitalfields; but wages are nearly the same in both. The average per week, after deducting expenses, was, in 1838, for velvets and satins, 12*s.*; for figured goods, 1*s.* 6*d.* and for gros-de-Naples, about 7*s.* 6*d.* In addition to silk weaving, there is at Sudbury a manufacture of buntings, which employs about 200 looms in the town. These are wrought by women and children, or old men unfit for silk-weaving. The wages obtained at this employment average from 3*s.* 2*d.* to 4*s.* 6*d.* a week. (*Hand-loom Weavers' Rep.* li.)

Sudbury is governed by a mayor, 3 other aldermen, and 12 councillors; and has a commission of the peace, a weekly court of record, &c. Corp. rev., in 1840, 317*l.* 12*s.* The parl. and mun. bors. are co-extensive.

Sudbury has sent 2 mems. to the H. of C. from the early part of the reign of Elizabeth. The Boundary Act increased its limits, as already noticed; but it is said, whether justly or not we do not undertake to decide, to be now, as formerly, distinguished by the venality of a large portion of the constituent body. Reg. electors, in 1835-40, 594. Markets on Saturdays. Fairs, March 12, July 10, and Sept. 4., for earthenware, glass, and toys. (*Parl. Rep.*)

Gainsborough, the eminent artist, worthy, as Sir Joshua Reynolds has stated (*Fourteenth Discourse*), to rank among the first painters of the English school, was a native of Sudbury, where he first saw the light in 1727. Sudbury was also the birth-place of Dr. Enfield, whose *Compendium of Brucker's History of Philosophy* is drawn up with great skill and judgment, and is, in fact, the best work on the subject in the English language.

**SUEZ**, a town and sea-port of Egypt, near the N. extremity of the gulph of its own name, which is also the N.W. angle of the Red Sea, 76 m. E. Cairo; lat.  $29^{\circ} 10''$  N., long.  $30^{\circ} 17' 55''$  E. Pop. recently estimated at 1,500; but this must be independent of the numerous pilgrims and merchants, who are continually passing through the town, Suez being on the main route between Cairo and Mecca, and on that by which the commerce of

Egypt with the countries to the eastward is carried on. The head of the gulph on which it stands has always been the seat of a considerable transit trade, and the ancient cities of Arsinoe and Kolzoun stood in the neighbourhood; but Suez is a comparatively modern as well as a very mean town. Turner says, "Take it for all in all, Suez is indisputably the most miserable place I have seen in the Levant. Its only gate is to the N.W.: three cannon are mounted near it, and there are eight more on the banks of the sea. In its present state, 50 men could take it with ease. Suez produces nothing, bring on all sides surrounded by the desert. The clothes, and even the provisions, of the inhabs. are all brought from Cairo, to the last loaf. Freshmeats come from Jaffa, and Jerusalem, bringing oil, tobacco, and soap." (*Turner's Levant*, ii. 414, 415.) It suffered much from the French, by whom it was in great part destroyed; and it now consists merely of sun-dried brick houses and unpaved streets, with about a dozen mosques, a Greek church, custom-house, &c.; the whole surrounded by a ruined wall and some entrenchments thrown up by the French. It is wholly destitute of water, which is brought to it by the Arabs from wells several miles distant, and, besides being high-priced, is of a nauseous description. The port is accessible only by boats of from 30 to 60 tons. Steamers and other vessels belonging to the E. I. Company moor outside a sand bar at a distance of 2 m. from the town. But since the establishment of a line from Essex, and the over-land route to India, Suez has become a place of considerable importance, and is now the residence of an agent for the E. I. Company, and of several commercial agents.

The Gulph of Suez, which at low water is in many parts so shallow as to be fordable, is memorable in Sacred History as the scene of the submersion of Pharaoh and his host. The isthmus of Suez, connecting Asia and Africa, is a sandy waste, between 70 and 80 m. across. Near Suez may still be seen the vestiges of the canal cut by Pharaoh Necho and Ptolemy Philadelphus, to unite the Red Sea with the Nile. (*Turner's Levant; Diet. Geog.; Private Information, &c.*)

**SUFFOLK**, a marit. co. of England, having N. the co. of Norfolk, the German Ocean, S. Essex, and W. Cambridge. Area, 955,600 acres, of which about 820,000 are supposed to be arable, meadow, and pasture. Surface generally flat. Soil various; that of the middle and most extensive district consists principally of a strong loam, on a clay-marl bottom. The district, bounded by the rivers Stour, Orwell, and Brett, S. from Bursfild, is a very rich loam, of extraordinary fertility. The maritime district, lying along the E. coast, consists of sandy loam and sand, which in some places is covered with heath. The soil in the N.W. parts is comparatively poor, consisting partly of sand and partly of peat. On the whole, Suffolk is not inferior, in respect of natural fertility, to any co. in the kingdom. The climate is dry; but frosts are severe, and in spring the N.E. winds are sharp and prevalent. Tillage husbandry is prosecuted with great skill, spirit, and success. Ploughing, in every part of the co., is performed, as in Scotland, by a pair of horses driven by the ploughman, and is extremely well executed. Fallowing is uniformly practised on the heavy lands. These, also, are particularly adapted for the growth of beans, which, as well as peas, are extensively cultivated. Turnips not so extensively grown as in Norfolk, being principally raised on the borders of Cambridgeshire. On clover leys wheat is very generally planted by the dibble; but, when the land will admit, all sorts of grain, as well as turnips, are drilled. Most of the land in beans, peas, tares, &c., is now drilled without any ploughing, being merely scarified and scuffed, so as to be rendered fine enough for the drill to work. The usual rotation in the turnip lands is, 1st, turnips; 2d, barley; 3d, seeds; 4th, wheat; on the heavy lands, 1st, fallow; 2d, wheat; 3d, seeds or beans; 4th, wheat; when the 3d is seeds, beans or oats come in 5th. Hemp has been cultivated for a lengthened period, and is reckoned of the finest quality. Carrots are a good deal grown; and hops are raised in the vicinity of Stowmarket. Suffolk is famous for its breeds of horses, cattle, and hogs. The horses are called *punches*; and are, as the term implies, short and compact, being well fitted for regular farm work. The cattle have sprung from the Galloways, many of which are fattened in the co. Like their progenitors, they are polled, and rather small-sized. They are better suited than the Galloways for the dairy, being excellent milkers. The produce of butter is not, however, supposed to be in proportion to the milk, though it be also very considerable. Arthur Young supposed that about 40,000 firkins of butter were annually sent from Suffolk to London. (*Surrey*, 2d ed. p. 204.); and, as the management of cows is now better understood, and more attended to, the quantity may, at present, be increased to 50,000 or 55,000 firkins. Stock of sheep about 500,000. Warrens were formerly numerous in the sandy district, but they are now much diminished. Property much divided; a good deal in the hands of respect-

able yeomen, who cultivate their own estates. Farms generally large, but many small. They are usually let on lease for 7 or 14 years. Tenants mostly restrained from exceeding 3 corn crops to a fallow; but, in other respects, they are left pretty much at liberty. Farm buildings indifferent. Cottages generally bad. Average rent of land, 14s. 3d. an acre. Minerals of no importance. This co. was formerly celebrated for its manufactures, particularly those of wool; but they are now much decayed. Mixed silks and worsted stuffs are still, however, manufactured at Sudbury, Gainsford, and other places. Gun-dints are made in large quantities at Brandon. There is a considerable manufacture of stays at Ipswich. Suffolk is well watered, being intersected by the rivers Orwell, Deben, Ald, Blythe, and Lach. It is separated from Essex by the Stour. Suffolk is divided into 21 hunds., and 510 pars. It returns 11 mems. to the H. of C.; viz., 4 for the co., 2 each for the bor. of Bury St. Edmunds, Ipswich, and Sudbury; and 1 for the bor. of Eye and contiguous pars. Registered electors for the co., in 1839-40, 11,495, viz. 6,404 for the E., and 5,091 for the W. div. In 1841, Suffolk had 64,681 inhab. houses, and 315,129 inhab., of whom 154,107 were males, and 161,022 females. Since expended for the relief of the poor in 1838-39, 145,971. Annual value of real property in 1815, 1,157,305*l*. Profits of trades and professions in ditto, 453,185*l*.

**SUMATRA**, the most W. island of the E. archipelago, and, next to Borneo, the largest in the E. seas, between lat. 6° N. and 4° S., and the 96th and 106th degs. of E. long., separated on the N.E. from the Malay peninsula by the Straits of Malacca, and on the S.E. from Java by the Straits of Sunda, having E. the Sea of Java, and surrounded on nearly all other sides by the Indian Ocean. Its direction is from N.W. to S.E., nearly parallel to the Malay peninsula, it being divided by the equator into two nearly equal portions. It is of an elongated shape, about 1,650 m. in length, and has an area variously estimated at from 122,000 to 128,000 sq. m. Its population is wholly unknown; but it has, notwithstanding, been estimated at about 2,000,000. Various mountain chains run through the island longitudinally, sometimes in treble or four-fold ranges, rising under the equator to 11,000 or 15,000 ft. in height, and always much nearer to the W. than to the E. coast. The E. half of the island is, in fact, almost wholly low, flat, and intersected by numerous rivers. Some of these, as the Palembang, Jambi, Indragiri, and Siak rivers, are of considerable size, but they have been hitherto little explored by Europeans. The W. side of the island is also well supplied with water; and in the interior are numerous small lakes. The climate, even in the plains, is not so hot as might be expected in a country situated in the midst of the torrid zone. The thermometer at mid-day generally fluctuates between 82° and 85° Fahr., though it sometimes rises to 87° or 88° at sunrise. It is usually as low as 70°. Dense fogs, thunder storms, and water-spouts, off the coasts, are very frequent. The soil on the W. side of the island, which is that best known to Europeans, is a stiff reddish clay, and a great proportion of the surface, especially towards the S., is an impervious forest. Gold dust, which is very abundant, copper, iron, sulphur in the numerous volcanic districts, saltpetre, coal of indifferent quality, and naphtha appear to be the chief mineral products. The copper ore is very rich, but, owing to the indolence of the inhabs., the mines are little wrought, except over a very limited district. Gold dust is, however, an article of considerable traffic, and is brought by merchants from the interior to the sea-coast, where it is bartered for iron, iron tools, and the piece goods of the E. Indies and Europe. Among the vegetable products, the most important is pepper, the average produce of which may amount, at present (1842) to about 30,000,000 lbs. a year, of which about 21,000,000 are furnished by the W., and 9,000,000 by the E. coast. This supply amounts, in fact, to more than all the pepper supplied by all the other countries in the world. Nearly the whole of this dutch trade is in the hands of foreigners, especially Dutch, English, and Americans. But little Sumatra pepper goes to China.

After the capture of the Moluccas by the British, in 1796, the nutmeg and clove were introduced at Bencoolen; and, in 1823, their culture had so far succeeded, that the produce, in that year, was estimated at 89,000 lbs. of nutmegs, 34,000 lbs. cloves, and 25,000 lbs. of mace; but their quality being very inferior, as compared with the products of Amboyna and the Banda Isles, the culture has made little farther progress. Camphor is one of the most valuable kinds of produce, and the Sumatran camphor sells in China for 12 times the price of that of Japan. It is the concrete juice of the *Dryobalanops Camphora*, and a tree of the order *Guttifera* (whereas the Japan camphor is derived from a species of laurel). It grows only in the N. part of Sumatra, not being found S. of the line, or beyond the 3d deg. of N. lat. It is a stout tree, its trunk sometimes measuring 6 or 7 ft. in diameter. The same tree pro-

duces, under different circumstances, camphor, oil, or pitch, which are found in cavities of the trunk, not extending the whole length of the tree, but in small portions of 1 and 1½ ft. long at certain distances. "The method of discovering the camphor is, by making a deep incision with a Malay axe, till the camphor is seen: hundreds of trees may be thus mutilated before the sought-for tree is discovered; when attained, it is felled and cut inunks, a fathom long, which are again split, and the camphor is found in the heart, occupying a space of the thickness of a man's arm. The produce of a middling-sized tree is about 8 Chinese catties, or nearly 11 lbs.; and of a large one, double the quantity." (*Roxburgh in Asiatic Researches*, xii.) Rice is the principal species of grain. It is of very different varieties, comprised in the two great classes of upland and lowland, the former being considered the best. The land destined for its culture is chosen at the approach of the dry season; and as fresh ground is frequently cleared for the purpose, the wanton destruction of fine timber is immense. The rice is sown at the beginning of the rains, and ripens in about five months from that time. The same spot of low ground is, for the most part, used without intermission for several years, the degree of culture bestowed by turning up the soil, and the over-flowing water, preserving its fertility. Fallows occur occasionally; but as occupancy in most parts of Sumatra gives the right of property in the land, they are not very frequent.

The *sawahs*, or fields adapted for rice in low and wet situations, are prepared by turning into them a number of buffaloes; or in parts where it is less permanently moist, the soil is turned up either with a wooden instrument between a hoe and a pickaxe, or with a plough. While the *sawahs* are in preparation, a small, adjacent, and convenient spot of good soil is chosen, in which the seed grain is sown as thick as it can well lie on the ground; and after having grown to the height of several inches, it is taken up, in showery weather, and transplanted to the *sawah*, where holes are made, four or five inches asunder, to receive the plants. To the minute care thus bestowed upon the latter, Marsden attributes the large proportion of produce obtained, which, he says, averages 100, and is sometimes as high even as 150 fold. (*Marsden's Sumatra*, p. 77.) A singular method is adopted for separating the grain from the ear. The bunches of paddy are spread on mats, and the Sumatrans rub out the grain under their feet, supporting themselves for the more easy performance of this labour by holding with their hands a bamboo, placed horizontally over their heads. As an article of trade, Sumatran rice seems to be of a more perishable nature than that of most countries, the upland rice not being expected to keep longer than 12 months, and the lowland showing signs of decay after 6. Sago is common in Sumatra, and is used occasionally as food, though not an article of general use. Millet is cultivated, but in no great quantity. The cocoanut, betel, bamboo, sugar-cane, various palms, and an abundance of tropical fruits, are indigenous. The sugar-cane is cultivated not for the manufacture of sugar, but for the sake of chewing the juicy root; and bemp, instead of being used for the supply of materials for cordage, furnishes an intoxicating preparation. Turmeric, ginger, cassia, indigo, coffee, caoutchouc, rattans, many scented woods, and in the N. benzoin, are among the other principal kinds of produce.

Buffaloes are the most important live stock; the ox does not appear to be naturalised. The breed of horses is small, but well-made and hardy; sheep also are small. The hog and goat are both domestic and wild. Elephants, and many species of deer, abound; and tigers of a large and powerful species, the rhinoceros, hippopotamus, orang-outang, bears, &c. are met with, beside a great number of great variety. Around the shores, extensive coral islands are continually forming; and coral is one of the principal articles of export, the other exports being pepper, rice, camphor, and other native products. The exports are chiefly Indian piece goods, salt, silks, and opium from Hindostan; coarse porcelain, iron pans, gold thread, and many small articles from China; striped cottons, spices, krisers, and other weapons from Java, Celebes, and the rest of the archipelago; metals, hardware, cutlery, and broad cloths from Europe.

According to native traditions, Sumatra and the adjacent islands have been the original seat of the Malay race; the type of which is certainly there met with in its greatest perfection. Except the Achinese, inhabiting the N. extremity of the island, and whose commixture with the Moors of Western India has distinguished them from the other tribes, the Sumatrans, according to Marsden, may generally be described as follows:—"They are rather below the middle stature; their bulk is in proportion; their limbs are for the most part slight, but well shaped, and particularly small at the wrist and ankles. Upon the whole they are gracefully formed, and I scarcely recollect ever to have seen one deformed person. The women, however, have the preposterous custom of

flattening the noses and compressing the heads of children newly born whilst the skull is yet cartilaginous. They likewise pull out the ears of infants to make them stand at an angle from the head. Their eyes are uniformly dark and clear, and among some, especially the southern women, bear a strong resemblance to those of the Chinese. Their hair is strong, and of a shining black, the improvement of both which qualities it probably owes, in a great measure, to the early and constant use of coconut oil. The men are beardless, and have chins so remarkably smooth, that, were it not for the priests displaying a little tuft, we should be apt to conclude that nature had refused them this token of manhood. But the boys, as they approach to the age of puberty, rub their chins, upper lips, &c. with quick lime, and the few hairs which afterwards appear are plucked out from time to time with tweezers, which they always carry about them for that purpose. Their complexion is properly yellow, wanting the red tinge that constitutes a tawny or copper colour. They are, in general, lighter than the half-breed of the rest of India; those of the superior class, and particularly their women of rank, approaching to a great degree of fairness." (p. 41-46.) No negro or other distinct race appears to occupy the mountainous regions, as in other parts of the archipelago; and the partial difference between the Malays of the coast and the country inlands is so little marked, that it requires some experience to distinguish the two. (*Marsden*, p. 49.)

The original clothing of the Sumatrans is the same with that found by navigators among the inhabs. of the South Sea Islands; consisting of the inner bark of a tree, beaten out to the degree of fineness required, some fabrics being nearly equal in softness to the most delicate kid-skin. The dress of the men comprises short drawers, a close waistcoat, with filigree buttons, a robe extending sometimes to the knees, a party-coloured scarf, a sash in which the kris or dagger is stuck, and a small turban, or umbrella-hat, while that of the women consists of a bodice, a petticoat, reaching from the bosom to the feet, a robe with sleeves, and sometimes a gauze veil, &c., with various filigree ornaments. Both sexes file their nails, and otherwise disfigure their teeth; and the great men sometimes set theirs in gold, by casing the under row with a plate of that metal.

The villages are always on the banks of some river or lake, and consist of houses built chiefly of bamboo, and on posts, as in other countries of S.E. Asia. They are, however, much superior to those constructed among many other Ura-Gangetic nations. Their furniture is very simple, consisting, in the best kind of houses, chiefly of mats of a fine texture, serving for beds, some low tables, coarse earthenware, brass walters, and iron pans. In eating, neither knives, spoons, nor any substitutes for them, are used. The diet of the Sumatrans is mostly vegetable, but they eat the flesh of buffaloes, goats, fowls, &c., curried or otherwise dressed. In a few species of manufacture the Sumatrans exhibit great skill, such as working gold and silver filigree. This art, as described by Marsden (pp. 179, 180.), is conducted with the rudest tools. The wire-drawing instrument is made of a piece of iron hoop; "an old hammer head, stuck in a block, serves for an anvil; and I have seen a pair of compasses composed of two old nails tied together at one end. In general, they use no bellows, but blow the fire with their mouths, through a joint of bamboo; and, if the quantity of metal to be melted is considerable, three or four persons sit round their furnace, which is an old broken *kuali*, or iron pot, and blow together." (P. 179.) Yet the manufactured material is celebrated for its delicacy and beauty, not only throughout the E., but in Europe. They weave silk and cotton cloths for home consumption; and some of their work is very fine and the patterns prettily fancied. Different kinds of earthenware, *krisas*, and fire-arms are made; and it is said that formerly guns were cast at Achin. Little skill is, however, commonly shown in forging iron, or in carpenter's work. The Sumatrans are wholly strangers to painting and drawing; their carvings are always grotesque; and their proficiency in the exact sciences is very limited. Medicine is in the lowest state, being entrusted to old people, who, in a great measure, depend on charms and talismans for the cure of diseases! The Sumatrans are fond of music, and have many musical instruments, though most part of these have been borrowed from the Chinese. Their poetry is by no means contemptible, and is much favoured in point of harmony by the Malay language, the smoothness and sweetness of which have gained for it the appellation of the *Italian of the East*. They write in the Arabic character.

Sumatra is divided among a number of native states, the principal being Menangkabow, Achin, Slak, Palembang, and Lampong. The European settlements, Bencoolen, Padang, &c., are on the S.W. coast, trenching on the country of the *Rejangs*. Among this people, the inhabs. of the villages are under the jurisdiction of magisterial head-men, or *dupatis*, who meet at stated periods and places, in an assembly at which the *pan-*

geran, or feudal superior, presides. These pangerans claim despotic sway; but, like the *dupatis*, have, in fact, little more than a patriarchal and judicial power; they levy no tax, nor seem to have any revenue, other than accrues from their determination of cases referred to them in appeal from the decisions of the *dupatis*. And in the immediate neighbourhood of the more powerful states, the pangerans seem to acknowledge a kind of vassalage to the sovereignty of the latter. The *Rejangs* are said to be totally without religious worship of any kind, though not destitute of a belief in supernatural beings. A large proportion of the inhabs. of Sumatra are, however, Mohammedans.

Menakabowé, occupying the centre of the island, appears to have been always the leading state; but only meagre records of its history exist. Sumatra was first visited by the Portuguese in 1509, by the Dutch in 1600, and by the English two years afterwards. The latter continued to establish factories and form settlements in the island, during the 17th century; but principally in 1685-86. These settlements were retained by the British till 1825, when they were ceded to the Dutch in exchange for Malacca, &c. (Marsden's Sumatra, the most copious and by far the best work on the subject; and to which we refer for further details.)

SUNDERLAND, a par. and mun. bor., sea-port, and par. of England, being, next to Newcastle and Stockton, the greatest port in the kingdom for the shipment of coal, co. Durham, ward Easington, on the Wear, close to its mouth in the North Sea, 13 m. N.E. Durham, with which city it is connected by a railway, and 245 m. N.N.W. London; lat. (of light-house) 54° 55' 12" N., long. 1° 24' 16" W. Area of Sunderland par., 120 acres. Pop. of do., in 1831, 17,060. But the par. bor. comprises, along with Sunderland, the townships of Bishop-Wearmouth and B.-W. Pans on the S. side of the Wear, and those of Monk-Wearmouth, M.-W. Shore, and Southwick, on its N. side; the whole including an area of 5,065 acres, and a pop., in 1831, of 40,731. The portions of the town on the N. and S. sides of the river are connected by a magnificent iron bridge (see post).

Sunderland and Bishop-Wearmouth, at no distant time, were two distinct towns, at a considerable distance from each other. All the houses in Sunderland appear to be of considerable age; but in Bishop-Wearmouth the intervening space has been gradually encroached, and at last filled up by buildings, so that at present the two form only one town. With the exception of one street, in which there are some respectable houses and shops, Sunderland presents the appearance of one mass of small houses crowded together, with interstices of narrow lanes rather than streets. The population in them is so dense as to give the appearance of unhealthfulness as well as absence of cleanliness. This is not the case in Bishop-Wearmouth; in the new part of the town that adjoins Sunderland, there are some good streets, and excellent houses, and it is in this part that the higher classes of inhabitants reside. This town is increasing rapidly; several new streets have been recently built, and others are in course of building. Bishop-Wearmouth Pans is a small district running along the bank of the river from the parish of Sunderland to nearly as far as the bridge. Its pop. is very dense; it contains some glass manufactories and iron works for the manufacture of such articles as are required for the shipping. Monk-Wearmouth Shore is a large township immediately opposite Sunderland, and part of Bishop-Wearmouth, and has a dense pop., with but few houses or inhabs. of the higher classes. Adjoining Monk-Wearmouth Shore on the W., and extending for some distance along the river, is Southwick. In it are some coal pits and a railway: the greater part of the township, however, is agricultural, and contains very little trading population. Monk-Wearmouth lies to the N. of Monk-Wearmouth Shore, and does not come down upon the river. Its population is almost entirely connected with the trade of the port. The only carriage communication between the two sides of the river is by the bridge, on passing which, from the right to the left bank, a toll is taken. There are, however, several ferries for "passengers." (*Mun. Corp. Rep.*)

The cast-iron bridge now alluded to, over the Wear, is the most remarkable object in this part of the co. It was constructed between 1793 and 1796, at an expense of about 33,400*l.*, and consists of one magnificent arch 236 ft. in span, elevated in the centre above 100 ft. above high-water mark, so that large ships sail under it by merely lowering their top-masts. In 1816, this bridge was disposed of by a lottery of 6,000 tickets, at a price of 30,000*l.*

The parish church of Sunderland is large and handsome; its E. end is particularly elegant, the altar being placed in a circular recess under a dome. The living, a rectory, is worth 264*l.* a year. St. John's chapel-of-ease, built in 1769, is a perpetual curacy, worth 122*l.* Bishop Wearmouth church has an ancient chancel, and an early

decorated B. window, but the rest is modern. The living is a very valuable rectory, being worth 2,899*l.* a year. A new chapel-of-ease was built by parliamentary grant in 1827. Monk-Wearmouth church has had nearly all its ancient features obliterated by modern alterations, though it still possesses a rude Norman tower, &c. (*Richman's Gothic Architecture*). The living is a perpetual curacy, of the clear annual value of 228*l.* The foregoing livings are all in the gift of the Bishop of Durham; except the last, which is in that of Sir H. Williams. There are numerous places of worship for Dissenters in the town and vicinity, including a synagogue. The exchange, a neat edifice in the High Street, erected in 1814, at a cost of 8,000*l.*, comprises commercial, news, and court rooms, an auction mart, &c. The theatre, assembly rooms, barracks, custom-house, and excise office, are among the chief public buildings. Bathing machines are kept on the sands, E. of the town; and on the town moor, and at Hendon, S.E. of the town, baths have been established, Sunderland being a good deal resorted to in the bathing season. There is a subscription library, a mechanics' institute, at which lectures are delivered, and several other literary institutions. A school, founded and endowed in 1778, educates and clothes 36 poor girls, and it has, also, national, friends', and various inferior schools. A large infirmary occupies a new building raised in 1822; and an almshouse for 10 widows or daughters of master mariners, was founded and endowed in 1820. There are numerous other almshouses and charities of different kinds, and 4 freemason's lodges in the town and neighbourhood. The town is lighted with gas, and well supplied with water.

The port, immediately within the river's mouth, is formed by two great piers, each about 450 yards in length, which project one from the S. and one from the N. side of the river into the German Ocean. At the extremity of the N. pier is a lighthouse, having the lantern elevated 73 ft. above the sea at high water; there is, also, a harbour light on the S. pier, which shows during ebb and flood. At springs there is from 15 to 17 ft. water over the bar, and at neaps from 10 to 12 ft.; the channel is close by the N. pier head. To prevent the crowding of shipping in the river, a large basin or dock has been constructed on its N. side.

The staple businesses of the town are the building of ships and the shipment of coal. The former is carried on to a greater extent here than anywhere else in the kingdom. In 1840, for example, there were built in Sunderland no fewer than 302 ships, of the aggregate burden of 87,023 tons. During the same year there belonged to the port 918 ships, of the aggregate burden of 188,730 tons, manned by 8,078 seamen, being a greater amount of shipping than belongs to any other port of the United Kingdom, London and Liverpool only excepted. It would, indeed, appear, from the parliamentary returns, that Newcastle has a greater amount of shipping; but this results from the shipping belonging to N. and S. Shields being included in that of Newcastle, of which it makes fully a half. In 1839, 913,560 tons of coal were shipped coastwise from this port, and 370,620 tons were exported to foreign countries. In 1840, Sunderland supplied the metropolis with 2,474 cargoes, amounting to 730,118 tons of coal. Sail-cloth, chain cables, glass and earthenware, are also extensively manufactured in the town; and these, with lime, grindstones, wrought marble, &c., constitute, next to coal, the principal articles of export. The gross customs duties amounted, in 1840, to 119,681*l.* The fisheries are important; and the adjacent village of Deftford, on the Wear, has a large rope-factory wrought by steam. The Sunderland Joint Stock Banking Company was established here in 1836; and it has also a branch of the Newcastle, Shields, and Sunderland Bank, with several private establishments. Two weekly newspapers are published in the town.

Sunderland was created a bor. by Bishop Pudsey, At the end of the 12th century. Under the Municipal Reform Act, it is divided into 7 wards, and is governed by a mayor, 13 other aldermen, and 42 councillors. Though it has long been of considerable importance, Sunderland had no voice in the legislature until the Reform Act of 1832, which gave it the important privilege of sending 2 mems. to the H. of C. Reg. electors, in 1839-40, 1,637. Corp. rev. in 1840, 4,266*l.* It has a commission of the peace; and weekly sessions are held, besides courts leet and baronial by the Bishop of Durham. Market-day, Saturday; and for cattle every other Tuesday. Fairs, May 11. and 12., Oct. 12. and 13., for cattle, &c. This was the first town in England attacked by cholera in 1832. (*Parl. Reports, and original returns obtained for this work.*)

SUPERIOR (LAKE), the most westerly and most extensive of the great lakes of the St. Lawrence basin, in N. America, being probably the largest existing body of fresh water. It is of a triangular form, extending between lat. 46° 30' and 49° N., and long. 85° and 92° 30' W. Its length, E. to W., is about 360 m., with a mean breadth of about 80 m., so that its area may be taken at about 28,500 sq.

m. Its mean depth is estimated at 900 ft., and the height of its surface at about 64 ft. above the Atlantic. It receives upwards of 50 rivers, but none is of much importance except the St. Louis, which enters at its S.W. extremity, and the Rivière au Grand Portage. During the melting of the snow, these and the other rivers sweep into the lake vast quantities of sand, boulder stones, and drift timber. It discharges itself at its E. extremity into Lakes Huron and Michigan, by the river and falls of St. Mary. "This lake embosoms many large and well-wooded islands; the chief of which is Isle Royal. The country on the N. and E. is represented as a mountainous embankment of rock, from 200 to 1,500 ft. in height; the climate unfavourable, the vegetation slow and scanty. Upon the S. the land is also high, generally sandy, sterile, and the coast dangerous; subject to storms and sudden transitions of temperature, and to fogs and mists. The mean heat in June and July is about 65° Fah.; but a frightful winter prevails for nine months of the year. The Chippewy Indians inhabiting the shores are poor and miserable, depending for subsistence chiefly upon the fish of the lake, and the wild rice of the adjacent savannahs." (*New York Gaz.*) But, notwithstanding these unfavourable circumstances, the harbours of Grand Isle and Chegoimagon Bay, on the S. coast, are excellent; and the lake is now navigated by steamboats and sailing vessels equal to the craft navigating the lower lakes. (*Swenson.*) The Hudson's Bay Company have several stations round the coasts of this lake. (See also *Encyc. of Geog.*, Amer. edit.; *Darby's Geographical Views*, &c.)

SURAT, a large town of Hindostan, cap. prov. of Gujrat, and of the British distr. of its own name, under the presid. Bombay, on the Taptee, about 20 m. above its mouth, in the Gulf of Cambay, and 128 m. N. by E. Bombay; lat. 21° 11' N., long. 73° 7' E. The pop. was loosely estimated, in 1818, at 157,000. It is about 6 in. in circ., shaped like a bow, the chord, formed by the Taptee, having, near its centre, a small castle garrisoned by a few sepoy and Europeans. On either side the town is surrounded by a wall flanked with semi-circular towers. Without the wall are some good European houses, formerly occupied by the French, but now the residences of the English officers; the houses within the town are very inferior, consisting only of timber frames filled up with bricks, their upper stories projecting over each other. The streets, also, are narrow and irregular. Surat has an English church and an English school, with numerous Hindoo schools. A large European cemetery, containing the tomb of Sir G. Oxenden, one of the earliest governors of British India, &c.; but the most remarkable building or institution is an hospital for sick animals similar to that at Barroch. During the last century this hospital contained horses, mules, oxen, sheep, goats, monkeys, poultry, pigeons, and a variety of birds; also an aged tortoise, which was known to have been there 75 years. The most extraordinary ward was that appropriated for rats, mice, bugs, and other noxious vermin, for whom suitable food was provided. (*Hamilton, E. I. Gaz.*)

Surat had formerly a large trade in all kinds of eastern produce; but this has greatly declined, and its exports consist at present (1842) principally of cotton wool, which is sent in large quantities to Bombay. Most part of the old manufactures of Surat, except kinebobs and shawls, for which there is little demand, have been superseded by those of Great Britain, and the greater number of the native merchants have become poor. Among the traders, however, are numerous Parsees, the descendants of those expelled from Persia by the Mohammedans, who have the reputation of being wealthy. Vessels of 30 or 40 tons may come up to Surat; but those of greater size must lie about 15 m. lower down the river; and few boats larger than the ketches in the E. I. Company's service ever ascend so high as the town.

Surat is the residence of a British collector, judge, military commandant, &c., and is the seat of a board of customs, a circuit court, and of the *Sudder Adawlat* or chief tribunal for the entire presid. of Bombay. It is supposed to be one of the most ancient cities of Hindostan, being mentioned in some of the earliest records. The English factory, founded here in 1615, was the first mercantile establishment of the E. I. Company in the Mogul dominions, and continued to be the chief British station in India till Bombay became the seat of supreme authority, in 1667. (*Hamilton; Mod. Trav.*, x. 144—149, &c.)

SURINAM. See GUYANA (Dutch).

SURREY, a co. of England, which, though inland, enjoys from its being skirted on the N. by the Thames, most of the advantages of a maritime co. It has to the N. Middlesex, and a small part of Bucks, from both of which it is separated by the Thames; on the E. it is bounded by Kent, on the S. by Sussex, and on the W. by

Hampshire and Berks. It comprises all that portion of the metropolis to the S. of the Thames, and is thus, in fact, a metropolitan co. Area, 468,120 acres, of which about 400,000 are arable, meadow, and pasture. With the exception of the Weald, the surface consists of alternate hill and dale. Some of the hills rise to a pretty considerable height, affording highly diversified and beautiful prospects. The soil comprises every variety, from the richest loam to the poorest moor. There are three portions, the soils of which are particularly well defined; viz. 1st, the Weald, occupying all the S. part of the co. from Croyhurst to Haslemere; 2dly, the sandy loam district, lying between the Weald and the downs; and, 3dly, the downs, or chalk land, occupying the whole E. side of the co. from Croydon to Tilsey, but gradually decreasing as we advance W. till at Farnham, on the border of Hants, it is reduced to a narrow strip. To the N.E. of the downs, between them and the Thames, there is a great variety of soil, partly consisting of strong dark clay, partly of sandy loam, &c. In the N.W. and S.W. parts of the co., but especially the former, there are very extensive tracts of heath and moorish ground; and smaller tracts of the same kind are met with in various other places. On the whole, however, the co. may be said to be of an average degree of fertility. Climate good; and, owing to the variety of surface, the abundance of wood, and its contiguity to the metropolis, it is one of the most desirable co.s. in England for a residence. A large proportion of Surrey is in tillage; but agriculture, speaking generally, is in a decidedly backward state, and two, or even more, white crops still not unfrequently follow in succession. On the rich friable calcareous loams between Croydon and Epsom, 6 quarters of wheat an acre are not unfrequently reaped; and on the rich sandy loams near Godalming, 5 quarters is no uncommon crop; but on the poorer soils, and in the Weald, the produce seldom exceeds from 2½ to 3 quarters. The turnip culture was introduced into Surrey sooner than into any other English co.; but even at present turnips are but seldom drilled; their management is but imperfectly understood, and tares are generally preferred by the Surrey farmers to any other species of green crop. Turnip ploughs are used in many quarters, but the swing plough is most common. It is drawn by 3, 4, or even 5 heavy horses yoked in line. Lime is extensively used as manure; and the application of salt for that purpose is daily becoming more general. Hops are raised in considerable quantities; and those grown in the neighbourhood of Farnham are preferred to most others. Peppermint, lavender, wormwood, chamomile, &c. are raised in the physic gardens about Mitcham; and a considerable extent of land at Battersea, and other places along the banks of the Thames is appropriated to the production of asparagus and other vegetables for the London market. There is no peculiar breed of cattle in Surrey, but the short horns and the Sussex breed are the most prevalent. A considerable number of sheep are kept, principally on the down-land. Large numbers of pigs are fed; they consist principally of the Berkshire and Chinese varieties. The Dorking breed of fowls is in high estimation; they are large, handsome, perfectly white, and are distinguished by having six claws to each foot. There are no very large estates in Surrey. Farms of all sizes: the largest are on the down-lands, and the smallest in the Weald; but, at an average of the co., the size of farms is not supposed to exceed 170 acres. They are commonly held under leases for 7, 14, or 21 years; but the vicious customs that prevail as to entry defeat the advantages that might otherwise have resulted from this tenure. (See *Kennedy and Grainger, Letting of Land*, l. 321.) In the Weald the farm-houses are mean and ruinous, but they are better in other places. Cottages good, and frequently ornamented with vines and flowers. Average rent of land, in 1840, 15s. 22d. an acre. There is a great deal of valuable timber and coppice wood in Surrey, particularly in the Weald. Large quantities of fuller's earth are dug up in various places; and there are also excellent quarries of freestone and limestone. Except in so far as it is connected with the metropolis, Surrey has very few manufactures; and those of little or no importance. Besides the Thames, it is watered by the Wey, the Mole, and the Wandale; and it is traversed by the Surrey and Croydon Canals, and by the Brighton and S.W. railways. Turnpike roads good; but cross roads, particularly in the Weald, very indifferent. It contains 13 hundreds exc. of the bors. of Southwark and Lambeth, and the town of Guildford; and is divided into 142 parishes. It returns 11 mems. to the H. of C.; viz., 4 for the co., 2 for the bor. of Guildford, 1 for the bor. of Reigate, 2 for Lambeth, and 2 for the bor. of Southwark. Registered electors for the co., in 1839-40, 9,847, of whom 6,146 were for the E., and 3,681 for the W. div. In 1841, Surrey had 95,375 inhab. houses, and 582,613 inhabs.: of whom 278,186 were males, and 304,427 females. Sum expended for the relief of the poor, in 1838-39, 164,227l. Annual value of real property, in 1815, 1,589,702l. Profts of trade and professions in 1815, 1,564,533l.

\* These measurements correspond with those of Stevenson (*Civil Engineering in North America*, p. 5.) and the best maps. Darby makes the area 21,000 sq. m.

**SUSSEX**, a marit. co. of England, on its S. coast, having N. and N.E. Surrey and Kent; S. and S.E., the English Channel; and W., Hants. Area, 938,240 acres. Surface and soil, very various. A ridge of chalk hills, to which (though in strictness applicable only to a part) the term South Downs is usually applied, runs through the co. from South Harting and Miland Chapel, on the confines of Hants, to Beachy Head, where it terminates in high precipitous cliffs. Their N. declivity is rather steep, but that on the S. is gently sloping. The soil on the South Downs is generally a light hazely mould, on a substratum of loose chalk. On the S. side of this range, along the coast from Emsworth, gradually decreasing to near Brighton, there is a considerable extent of fine, rich, loamy land. To the N. of the S. Downs is the extensive tract called the Weald of Sussex, uniting on the E. with the Weald of Kent, and stretching as far W. as Petworth. The soil of the Weald is similar to that of the Weald of Kent; being, for the most part, a stiff tenacious clay, with occasional sandy and gravelly patches intermixed. It is thickly covered with oak wood; and, when viewed from the South Downs, appears like an immense forest. In the E. parts of the co., in what is called Pevensey Level, and near Winchelsea, are considerable tracts of very fine, deep, marsh land. Climate mild, dry, and early. A large extent of Sussex is under the plough; but husbandry is in a backward condition; and Messrs. Kennedy and Grainger truly state, that no very material improvement need be expected till those pernicious habits, with respect to the letting and entry to farms that prevail here, as well as in Kent and Surrey, be totally changed. (*Tenacity of Land*, l. 337.) Crops principally cultivated, wheat, oats, and barley; and on all the light lands, turnips are extensively grown. Great quantities of hops are raised, particularly in the eastern parts of the country; there being, in 1858, 11,517 acres under this crop. Sussex is deservedly celebrated for its breeds of cattle and sheep; each being about the very best of its kind. The oxen are of a deep red colour, and have tapering turned-up horns; they fatten easily, produce excellent beef, and are not inferior to any other breed in field labour. The greater part of the tillage in the Weald is performed by ox-teams. The native cattle do not, however, answer for the dairy. The peculiar breed of sheep belonging to the co. is called the South Down, from its being found in the greatest perfection on the South Down Chalk Hills. The breed is now widely diffused; but owing to the extension of tillage on the Downs, and the increase in the size of the animal, and the weight of the fleece, neither the mutton nor the wool is supposed to be so good as formerly. Total stock of sheep estimated at nearly 300,000.

Sussex has been celebrated from the remotest period for the abundance and excellence of its timber, and in these respects it continues to be decidedly superior to every other English co. Oak is the principal timber of the Weald; but in other parts beech is most prevalent. To the abundance of wood is principally to be ascribed the circumstance of Sussex being formerly distinguished for the number of its iron-works; but since pit-coal began to be generally employed in the smelting and refining of iron, these have been wholly abandoned, as well as those that were formerly established in Kent. Property much divided. Average size of farms in the Weald 100 acres; in the Downs, from 1,200 to 2,000 acres. A great proportion of the farms held by tenants at will; and owing to injurious customs as to entry, a large part of the capital of the tenant is swallowed up in the useless payments he is compelled to make; so that much of the land is very insufficiently stocked. Offices invariably thatched and weather-boarded. Average rent of land, in 1810, 11s. 8d. an acre. Manufactures of little importance. Ironstone, miller's earth, limestone, and sandstone are all met with. The rivers are of no great magnitude. The principal is the Arun. It communicates by a canal with Langport harbour on the W., and with the Wye and the Thames on the N. In the Weald there are several ponds in which freshwater fish are fed for the London markets. Sussex is divided into 6 rapes, and these again into 65 hundreds, and contains 310 parishes. It returns 18 mems. to the H. of C.; viz. 4 for the co.; 2 for the city of Chichester; 2 each for the bors. of Brighton, Lewes, Hastings, and Shoreham; and 1 each for Arundel, Horsham, Midhurst, and Bye and Winchelsea. Registered electors for the co., in 1839-40, 8,592, of whom 5,316 were for the E., and 3,276 for the W. division of the co. In 1811 Sussex had 54,066 inhabited houses, and 299,770 inhabitants, of whom 147,572 were males, and 152,198 females. Sum expended on the relief of the poor, in 1838-39, 142,410*l*. Annual value of real property, in 1815, 919,350*l*. Profits of trade and professions in do., 372,059*l*.

**SUTHERLAND**, a marit. co. of Scotland, occupying the N.W. angle of the country, has on the N. and W. the Atlantic, E. the co. Caithness and the Moray Frith, and S. the Frith of Dornoch, Ross, and Cromarty. It contains 1,152,640 acres, of which 30,980 are under water. The

aspect of the country is wild, bleak, and, in many parts, savage. The E. shore has a small fringe of good arable land; but the rest of the surface is rugged and mountainous, being, however, interspersed with various narrow straths, or glens, and some considerable lakes and morasses.

Sutherland, like the other Highland cos., was, till recently, occupied by native tenants, similar in all respects to those of Ross. These, however, have, for the most part, been recently removed either to villages on the coast, or have emigrated; and the lands have been divided into extensive sheep farms, furnished with excellent houses and offices. The native breed of cattle is small, but when crossed by those of Argyle and Skye, it is said to be equal to any that the Highlands can produce. Galloways, and other varieties, have also been introduced. Owing to the extraordinary extension of sheep farming in this co., the stock of cattle has been diminished in a still greater degree than in Ross; but sheep being much better suited to the country, the change has been, both locally and in a public point of view, highly advantageous; vast tracts having been, through its means, coupled with a very extensive drainage, rendered considerably productive, that were formerly almost useless. Cheviots are found to thrive remarkably well in almost all parts of Sutherland. About 40,000 sheep and 180,000 fleeces are said to be annually sent to the S. from this co. (*Anderson's Highlands*, p. 12.) Four fifths of the co. belong to the Duke of Sutherland, who has expended vast sums in the formation of roads and inns, the building of bridges, piers, farm-houses, and villages, and other expensive and substantial improvements. Since 1811 above 100 m. of road have been made in the co. by the parliamentary commissioners, and above 350 by individual exertion and private labour! The fringe of arable land along the E. coast has been divided into moderate-sized farms, well inclosed and drained, and presenting as good a specimen of the improved turnip husbandry as is to be found in any part of the island. No where, indeed, in Scotland have improvements been attempted on a greater scale, or prosecuted with more zeal, skill, and success, than in this remote co. Whether the change should not have been more gradually introduced, we shall not undertake to say; but there cannot be a doubt, that the character and habits of the people, as well as the rural economy of the district, have been signally improved.

Sutherland has three great deer forests; and ptarmigan, grouse, and blackcock, alpine hares, &c., are abundant. Limestone and freestone are met with. Average rent of land in 1810, 6*l*. an acre. The herring fishery is carried on with spirit and success, both on the E. and W. coasts, but principally from Helmsdale. Principal rivers, Oichel, Fleet, Bosa, and Helmsdale. It contains 13 par.; but no considerable town. Dornoch, the largest, not having a pop. of 600*l*. It returns 1 mem. to the H. of C. Registered electors, in 1839-40, 137. Dornoch unites with Kirkwall, Wick, Tain, Dingwall, and Cromarty, in returning a mem. Valued rent, 26,052*l*. Scotch. Annual value of real property, in 1815, 33,878*l*.

**SUTTON-COLDFIELD**, a market-town and par. of England, co. Warwick, hund. Hemlingford, on the road from Birmingham to Lichfield, 6 m. N.N.E. Birmingham. Area of par., 13,030 acres. Pop., in 1831, 3,684. The town, on an acclivity, in a bleak situation, consists principally of one long street. Houses good, and the inhabs. well supplied with water. The par. church, an edifice probably of the 13th century, has a statue of Vesey, Bishop of Exeter in the time of Henry VIII., a native and a great benefactor of the town. A flourishing free school, founded by Vesey, and national schools, almshouses, and several other charitable endowments, exist at Sutton. The inhabs. are principally employed in the manufacture of Birmingham goods. The town, which is of great antiquity, was chartered by Henry VIII., under a warden, 10 aldermen, and 2 justices. The corporation had various privileges, which have since become void: petty sessions are, however, still held quarterly. Markets on Mondays: fairs, Trinity Monday and Nov. 8, for sheep and cattle.

**SWAFFHAM**, a market-town and par. of England, co. Norfolk, hund. South Greenhoe, 25 m. W. Norwich. Area of par., 8,130 acres. Pop., in 1831, 3,285. The town is finely situated on rising ground, and is well built. The par. church is a spacious and handsome structure, chiefly in the perpendicular style, with a lofty nave, the vaulted roof of which is richly adorned with figures carved in Irish oak; it has a well-proportioned tower, with enriched embrasures and pinnacles, some handsome pillars and monuments, and curious inscriptions. The living of Swaffham with Threxton vicarage and rectory, worth 738*l*. a year, is in the gift of the Bishop of Norwich. The Friends, Baptists, Wesleyans, &c. have meeting-houses. The co. bridewell, and a beautiful market-cross, surmounted by a figure of Ceres, erected by Lord Orford, in 1783; a public assembly-room and a neat theatre, are the other principal

public edifices. Swaffham has a free grammar and a national school, and various almshouses, &c. Quarter-sessions for the co. are held here at Midsummer, besides annual courts leet and baron, and weekly petty sessions. Markets, principally for butter, on Saturdays; fairs, May 12th, July 21st, and Nov. 3d, for cattle, sheep, and toys.

**SWANSEA**, a parli. bor., sea-port, and par. of South Wales, co. Glamorgan, hund. Swansea, on the W. bank of the Tawe, at its mouth in the Bristol Channel, 34 m. W. N. W. Cardiff; lat.  $51^{\circ} 37' 12''$  N., long.  $3^{\circ} 59' 30''$  W. Area of par., 2,661 acres. The parli. bor., however, includes also the par. of St. John Lansanlet and the hamlets of Morriston, Clas-Lower, &c., on both sides the river; having a total area of about 5,000 acres, with a pop., in 1801, of 6,831, in 1831, of about 18,880, and in 1841, of 21,239.

The compact portion of the town is about 1 m. in length, N. to S., by somewhat more than 4 m. in average breadth, and consists of three or four parallel lines of thoroughfares crossed by numerous others. It is generally clean, and pretty well built, and has been of some reputation as a watering-place. It has an excellent market, attended by all the neighbouring district, with a handsome court-house, in which the assizes, quarter and petty sessions are held, an infirmary, assembly-rooms, theatre, royal institution for literary and scientific purposes, with a good library and museum; mechanics' institution, 2 reading or newsrooms, savings' bank, poor-house, house of correction, a dole and benevolent societies, a society for prosecuting felons, and a branch of the Bank of England. The town is paved, lighted with gas, and well supplied with water, and has a small police, 3 *Mun. Corp. Rep.* The par. church is comparatively a modern edifice, with a square tower; the living, a vicarage, worth 291*l.* a year, is in the gift of a society. St. John's, a perpetual curacy in the gift of Sir John Morris, Bt., is worth 87*l.* a year. There are, also, a synagogue, Rom. Cath. and numerous other dissenting chapels; and on an elevated site near the centre of the town is Swansea Castle, founded in 1099, now partially converted into a barracks and stores. A free-school was founded in the town in 1682; but, like many other charities formerly established at Swansea, it has become nearly extinct. (See *Charities' Rep.* 32. iii.) There are, however, several national and Lancasterian, and numerous private schools.

Swansea is highly prosperous and increasing. It owes its importance principally to its collieries, and the extensive works for the smelting of copper and other metals established in its neighbourhood. The latter are upon a very great scale; and, in fact, by far the largest part of the copper ore produced in Ireland, Cornwall, and other parts of the U. K., as well as in Cuba, Chili, &c., is brought here for smelting. Swansea has also a very extensive trade in the shipping of coal, having exported 460,201 tons coastwise in 1840, exclusive of 15,67 tons sent to foreign parts. It has also two large potteries. The Tawe at its mouth expands so as to form a harbour, which is protected seaward by two handsome piers: vessels of considerable burden enter at high water, but at ebb tide the harbour is nearly dried. But it is intended to obviate this inconvenience by constructing a floating harbour, and it is also intended to unite the town with the hamlet of St. Thomas by a bridge, &c. A light-house is erected on the W. pier, and the Mumbles' Light is about 4 m. S. W. from the port. A canal goes from Swansea to Henneyard, in Brecknockshire; and two canals on the opposite bank of the river communicate, one with the adjacent collieries and the other with the harbour of Neath. There is a tram-road to the Mumbles and Oystermouth westward, by which coals are taken out, and lime and limestone brought in; and tram-roads also connect the different works and the canals and wharfs.

Exclusive of coal culm and copper ore, iron ore, limestone, clay, rotten stone, tin plates, and timber, are brought to Swansea for its own consumption, or for exportation inwards or outwards. Gross customs' revenue, in 1840, 8,934*l.* It has numerous manufactories. The municipal and parli. bors. are co-extensive. The former is divided into 2 wards, and is governed by a mayor, 6 aldermen, and 18 councillors. Its earliest charter extant dates from temp. Jno. There was no criminal court within the bor. till 1835, but it now has a commission of the peace; and a court-baron for causes under 40*l.*, and a court of pleas for those above that amount, are held every third Monday. Corp. revenue, in 1839, 3,450*l.* Swansea was formerly a contributory bor. to Cardiff, the right of voting having been in the burgesses by birth, marriage, or gift, resident or non-resident. It is now joined with Aberavon, Kenfig, Loughor, and Neath in sending 1 mem. to the H. of C. Registered electors, in 1839-40, for Swansea, 681; for the entire district, 1,247. It is also a polling-place for the co. Markets, Wednesday and Saturday. Fairs, second Saturday in May, July 2, Aug. 16, Oct. 8, and two following Saturdays. (*Boundary and Munic. Corp. Reports and Appendix; Charities' Reports, &c.*)

**SWEDEN** (*Suædica*), a kingdom of Northern Europe, comprising with Norway and Lapland the whole of the Scandinavian peninsula, of which it forms the Eastern,

Southern, and most important portion; between lat.  $55^{\circ} 20'$  and  $69^{\circ} N.$ , and long.  $11^{\circ} 18' 30''$  and  $24^{\circ} 13' E.$ , having N. E. Russian Finland, from which it is separated by the Tornea and one of its affluents; E. and S. the Gulph of Bothnia and the Baltic, S. W. the Sound, Kattegat, and Skagerrack; and W. and N. Norway, from which it is for the most part divided by the great mountain chain of Scandinavia. Length N. to S. 950 m.; average breadth about 190 m. Area about 170,700 sq. m. Sweden is divided into three principal regions, Götaland (Gothia) in the S., extending to about lat.  $58^{\circ} 45' N.$ ; Sweden proper, occupying the centre as far as lat.  $60^{\circ} 40' N.$ ; and Norland (by far the largest portion), comprising the remainder. It was formerly divided into 18, but is now divided into 24 läns, or governments, as follows:

Regions and Läns.	Area in Eng. sq. m.	Pop. in 1839.	Regions and Läns.	Area in Eng. sq. m.	Pop. in 1839.
<i>Norland:—</i>			<i>Götaland:—</i>

**Topography, Mountains, &c.**—The Scandinavian peninsula rises gradually from the W. coast of the Baltic until it reaches its greatest elevation in the great mountain chain, usually called the Scandinavian Alps, or Doffrine hills, dividing Sweden and Norway. This chain extends from the Sylt-fjell in about  $63^{\circ} N.$  lat. and  $12^{\circ} E.$  long. to the N. Cape, in the general direction of N. N. E. and S. S. W. It differs from the Alps and Pyrenees in not being a continued chain of summits, but a succession of large plateaux from 20 m. to 30 m. across, from which the culminating points project. The Sylt-fjell, the loftiest point on the Swedish coast, is 4,500 ft. above the level of the sea. The other principal peaks belonging to the same chain are the Sultelma 6,342 ft., and the Saulta 5,635 ft. in height. The Helags, within the frontier, has an elevation of 6,100 ft.

Speaking generally, Sweden may be said to be a flat country. There are, indeed, some ranges of high grounds and detached hills, but, on the whole, it is wonderfully level. This is so strikingly the case, that all the way from Gottenburg to Stockholm, by the Örebro road, there is not a single hill or declivity till within a few miles of the capital. (*Thomson's Travels*, p. 393.)

According to Forsell, 1-12th part of the surface of Sweden is 1,900 ft., more than 2-5th 700 ft., and 7-10th 285 ft. above the level of the Baltic. The remainder, consisting chiefly of the coasts, is of less elevation. These are, for the most part, fenced by numerous rocks and islets. The islands of Gothland and (Eland, in the Baltic, belong to Sweden: they are situated opposite the S. E. shores of the kingdom, and (Eland is separated from the main land by a narrow strait, which in one part (opposite Kalmar) is only about 4 m. across.

The S. provinces consist chiefly of vast sandy plains interspersed with small lakes and hills, which are sometimes bleak and barren; but elsewhere clothed with woods. The central region contains extensive plateaux of table land covered with forests. The N. part of the kingdom is diversified with mountains, deep valleys, and glens, alternating with sandy wastes and vast forests.

**Rivers.**—Sweden is extremely well watered. Through its N. and central parts, 12 large rivers flow into the Gulph of Bothnia. The Tornea, which has the longest course, runs almost due S. for about 250 m.; but the largest is the Angerman, 230 m. in length, so deep that ships of 600 tons load at Nyland, about 70 m. from the sea. Next to these are the Umea, with a course of 250 m., and the Windel, 235 m. in length. The general direction of the rivers falling into the Baltic is N. W. to S. E. Few of them are of any considerable size, and notwithstanding the generally flat country through which they flow, their navigation is much impeded by rocks and the numerous cataracts, and is rendered perilous during the inundations occasioned by the melting of the snows. Some of them increase 18 or 20 ft. in height so rapidly as to carry away large trees, and even to detach immense blocks of granite from the mountains; still, however, the inundations occasion little damage, owing to the recession of lakes, which serve as so many basins for the reception of the surplus water. There are, in fact, upwards of 80 considerable lakes, occupying in the aggregate a very large surface. The principal of these is

the Wener, the largest lake in Europe, after that of Ladoga, between lat. 58° 22' and 59° 25' N., and long. 12° 20' and 14° 12' E., above 90 m. in length, by 56 m. in its greatest breadth, 147 ft. above the level of the sea. It receives many streams, the only outlet for its waters being a channel about 200 yards in width, immediately below which is the celebrated cataract of Trohättta. Though in parts very deep, a great portion of this lake is so shallow as to render its navigation difficult and dangerous. The lake next in size is the Wetter, 86 m. in length, by 16 m. in its greatest breadth. It is about 26 m. S.E. the Wener, and 295 ft. above the level of the sea. In some places it is 70 fathoms deep: it is often agitated by sudden and violent storms. The Meälar lake is an inlet of the sea, extending westward from Stockholm, near its entrance from the Baltic, about 70 m., with a breadth varying from 2 to 20 m. It is deep and clear, contains some hundred islands, and is regularly navigated from April to November. The Hjälmä, a lake lying to the S.W. of the Meälar, to which it is united by a canal, is 35 m. in length, varying to 15 m. in width.

**Climate.**—For five or six months of the year the surface of the N. parts of the country, from the summits of the mountains to the bottoms of the valleys, is covered with ice and snow. The rivers and lakes are also frozen from October to April. In the central parts, the winter seldom lasts more than three or four months; and in the S. and W. parts, the climate is very similar to that of the N. of Germany. In the N. division a great degree of heat is experienced during a short period of the year. The transition from winter to summer is there, also, very rapid, often occurring within the space of a few days.

On the whole, however, the climate of Sweden is much milder than might be expected from its high N. lat. The winter is not so cold as in countries in the same lat. further to the E., at the same time that the mean temperature of the summer is but little inferior. According to Dr. Thomson, the mean annual temperature at Petersburg is 37.19° Fahr.; whereas at Stockholm it is 41.93°. The advantage on the side of Stockholm is chiefly in the six winter months, the mean temperature of these being in it 29.4°, and in Petersburg only 21.5°. During the six summer months, the advantage on the side of Stockholm amounts to only 2°; and in July and Aug. the temperature is 1.8° higher in Petersburg than in Stockholm. The winter is considered by the inhab. as regularly pleasant. The roads are always dry; and as the winds are seldom violent, travelling is both rapid and agreeable, the traveller defending himself from the cold by warm clothing. The great defect of the climate is the occurrence of frosts in Aug. and Sept., by which the crops are often injured. (*Thomson's Sweden*, p. 405.) Near Tornea, at midsummer, the sun is visible during the whole night. The longest day at that town is 2½, and the shortest 2½ hours. At Stockholm the longest day is 1½, and the shortest nearly 6 hours in length.

**Geology and Minerals.**—In point of structure, the whole of Sweden may, with few exceptions, be considered primitive. Granite and gneiss are the predominant rocks; but the former is more extensively diffused than the second, which is found chiefly on the shores of the Baltic, and in the S. part of the kingdom. A remarkable geological feature, which Sweden has in common with some parts of N. Germany and Denmark, is the presence of a vast number of enormous erratic blocks of granite scattered over its surface, especially in the central and S. provinces. In the S. they are collected in long spits, or tongues, resting upon the plains, which are quite unconnected with them; more to the N. they are scattered indiscriminately, and so profusely, that scarcely an acre of land is without one or more heaps of them. They seldom exceed 30 or 40 ft. in height above the surface, and form many islands in the lakes, as well as heaps on the plains. (*Laing, Sweden*, p. 41, 42.)

There are mountains of secondary formation in Jemtland, Nerica, E. and W. Gothia, and in the islands of Gothland and Öland. Shelly limestone, chalk, &c., are met with in Scania. Deposits of oceanic shells are found in the country near Uddevalla; but at Stockholm, Upsala, Hernösand, and at other places on the E. side of the peninsula, the shells discovered are of the kinds belonging to the Baltic, without any mixture of the oceanic. Sweden is rich in mineral products. Among these, are iron, the best in Europe, copper, cobalt, zinc, lead, antimony, gold and silver, alum, nitre, sulphur, with porphyry, marble, alabaster, limestone, millstone, whetstone, asbestos, potters' earth, &c. But the only metals that occur in any considerable quantity in Sweden, and the ores of which are worth working are iron, copper, and lead; iron being the most abundant and lead the scarcest of the three. There is a remarkable deficiency of the more valuable products found in secondary formations, as coal and salt. The former, indeed, has been discovered, and wrought, near Helsingborg, in the S. of the kingdom; but it is of very inferior quality: there are no salt beds nor brine springs, and the waters of the Baltic not being largely impregnated with salt, it is wholly imported.

**Vegetable Products.**—The forests of Sweden are estimated to occupy about 98,000 sq. miles, or four sevenths of the whole surface of the country. Those of the N. region consist of birch, pines, firs, &c., which, in the central parts, are intermixed with ash, willow, linden, and maple; and in the S. with oak, beech, yoke-elm, &c. Few beeches are found N. of lat. 57°; oaks are found as far N. as Sundswall. The linden is found as far N. as lat. 61°, the hazel as 62°, the cherry and ash as 63°, and the general limit of the birch and pine woods is lat. 69° 30'. The small dwarf birch, aspen, mountain-ash, and dwarf grey alder, are found as far N. as 70°, but only in the valleys and sheltered situations. The walnut and mulberry are almost entirely confined to Gotland; the chestnut is very rare. The forests were formerly much neglected; and there is now in many extensive districts a great deficiency of timber. Indeed, a considerable proportion of the firewood required for the consumption of Stockholm is brought from Finland. Latterly, however, a great deal more attention has been paid to the forests. Those belonging to the state have been placed under the care of a special institution, and very extensive plantations of oaks, firs, &c., have been made. The power of private proprietors to cut down timber was formerly limited; but this restriction no longer exists. In the interior of the country, however, and in such parts as have no facilities by means of water-carriage, or otherwise, for the conveyance of timber to the sea-ports, and are distant from mines, there is but little hope that the forests will ever become an object of considerable attention. Pears, apples, and plums of all kinds, grow in the open air in the S., but the grape, fig, apricot, and peach, do not ripen except in hot-houses. All kinds of melons are grown, currants up to lat. 68° 30', and gooseberries every where, even as far N. as lat. 70°. The soil is suitable for all kinds of pulse crops. Asparagus requires hot-beds in lat. 60° 30', cabbages cease to come to maturity in lat. 64°, carrots and parsnips grow to lat. 66° 20' N., turnips and potatoes nearly to lat. 70°. The yellow beet-root is produced spontaneously; the red is cultivated. A close sward of common grass is rarely seen; but docks, thistles, ragweed, and such roots as infest the land in more S. countries are seldom observed, even by the road side, or in the most neglected spots.

**Animals.**—The most common wild animals are the wolf, bear, fox, elk, reindeer, roebuck, gibbon, ermine, and a species of lynx. The wild boar is now found only in the Isle of Öland. Whales and sea-eals are occasionally found in the Baltic and Gulph of Bothnia; and the porpoise (*Dolphinus Phocaena*, Linn.) commits great ravages among the fish of those seas. There are few hares, but abundance of other kinds of game. The cock of the wood, or capercaillie (*Tetrao Urogallus*), formerly met with in Scotland, and recently reintroduced into that part of the U. Kingdom, is common in the Stockholm markets, whence it is sometimes brought to London; though inferior in flavour to grouse, it is much larger, sometimes weighing from 14 to 16 lbs., and is altogether a very fine species. Partridges are very plentiful, as are woodcocks and web-footed wildfowl. Eagles and falcons inhabit the cliffs; the wild swan and geese are hunted to their downs, and the eggs of the latter are highly esteemed. The seas surrounding Sweden abound with fish; including sturgeon, cod, lamprey, rays, soles, turbot, pilchards, herrings, and the streamling, a small species of herring, which has been latterly very abundant on the E. Swedish coasts. Excellent mackerel, and oysters, are found in the Kattegat. The rivers and lakes are well supplied with salmon, pike, perch, trout, eels, and numerous fish of the genus *Cyprini*. The pike, perch, barbel, and crayfish, are found in the Baltic, as well as in the lakes and rivers. Many of the fish of this sea appear to be of a mixed character, between oceanic fish, and those of fresh water.

**Agriculture.**—The soil of Sweden, though mostly thin and poor, has been greatly improved by the industry of the inhab. The coast land is usually bare of soil, the naked rock appearing every where. The flat alluvial lands around Lake Wener, and in the basins and valleys connected with it, consist of a harsh crystalline sand, impregnated with iron, and not very productive; but on the N. side of the lake, in the neighbourhood of Carlstad, the soil is of a superior description. In the country lying between the lake Wetter and the Baltic, there are some very fertile tracts: and round this lake, and in the district round Carlstad, especially the latter, agriculture has made great advances; the lands are well cultivated in large farms, and the country resembles some parts of the interior of England, except that the lands under cultivation are not fenced by hedges, but by wooden palings. Of the 170,715 sq. m. forming the surface of the country,

	Square Miles.
Arable lands occupy	3,190
Meadows and common pastureage	7,585
Uncultivated forest and mountain land	137,620
Lakes and marshes	22,663

The agricultural products consist chiefly of rye, barley, oats, maslin (a mixture of barley and oats), wheat, potatoes, pease, hemp, flax, and almost all the fruits and legumes common in W. Europe. In the S., rye is the most cultivated; in the N., barley, the culture of the latter increasing in proportion as we proceed farther towards the pole; but the grains of all lands are generally less nutritious than those of the S. of Europe, and are more difficult to preserve. Wheat succeeds as far N. as 63°, but does not ripen in W. Rothnia. Oats seldom ripen N. of lat. 63° 20', but barley is grown almost to the limits of the pine woods, in lat. 69° 30'. Hops are cultivated up to 62°, tobacco to 62° 30', and flax to nearly 64°. Buckwheat, madder, and woad are grown in Scania. In some parts of the S., the produce is equal to that of the best cultivated lands in England and France. In parts of Scania a return of 7 for 1 is obtained; but generally in Sweden the proportion does not exceed 4 for 1. The uncertainty of the climate and the chances of early frosts, are the greatest obstacles with which the agriculturist has to contend, and some singular devices are resorted to, to counteract their effects. In Jemtland, for example, the people pile up large quantities of wood along the N. side of the small patches of land sown with corn, that in case the wind should blow from the N. or N.E. in the evenings of August, they may set them on fire to protect the crop from the frosts! It is usual, also, in the S. parts of the country, to prevent the crop from being injured by frost when in the ear, to draw ropes across the heads of the grain, and shake off the dew before sun-rise, which, but for this, would then be frozen.

According to the official returns for 1837, the annual produce of grain and potatoes, after deducting the seed, amounted to —

Wheat	-	311,611
Rye	-	9,275,269
Barley	-	1,896,092
Oats	-	1,324,016
Maslin	-	77,168
Pease	-	2,915,888
Potatoes	-	4,115,112

1,015,161, equivalent to

about 41,000,000 Eng. bushels.

In the N. potatoes supply the deficiency of corn, and are preferred to all other kinds of food. Tobacco is cultivated near Stockholm, but not to any extent. After that of Holland, the flax produced in Sweden is probably the best in Europe. Hemp is at present not much grown; but the government is endeavouring to extend its culture.

The whole arable surface of Sweden is divided into 66,441 *hemmans* of land. The word *hemman* signifies merely an estate, or homestead, and gives no idea of the value or extent of the land, some being incomparably larger and more valuable than others. It is, in fact, a fiscal division for the purpose of levying the land-tax according to ancient assessments. Originally, however, the *hemmans* belonged, for the most part, to single proprietors; but they are now generally divided into 3, 4, 8, 16 or more parts, and it is rare for a family to possess a *hemman* entire. Of the 66,441 *hemmans*, 771 belong to towns, 56,000 to private individuals, 359 to the crown, 373 to academies and universities, 201 to colleges and schools, 289 to the church, 201 to hospitals and asylums, 183 to military schools, 31 to sailors, and 1,045 to the army. According to circumstances, the lands are subject to a different amount of taxation: of the estates belonging to the nobles, 3,462 are wholly exempted from all public burdens; and 17,925 estates, partly belonging to them and partly to other privileged parties, enjoy a partial exemption from taxation.

The estates that originally belonged to the nobles, but which, since 1810, may be indifferently held by nobles or commoners, are exempted from the land-tax, and also from the obligation to furnish a soldier for the army, the nobles themselves having been originally bound to personal service in the army. This inequality in the rate of taxation is practically, however, notwithstanding the statements of Mr. Laing to the contrary, of no real importance. The land-tax was fixed at a certain amount of produce centuries ago. It can no longer, therefore, be fairly regarded as a burden on the land, the value of which really depends on its net revenue after this fixed charge has been deducted. There is no injustice in the circumstance of certain lands in England being subject to tithe, while others are not; and it is quite as idle to talk about the injustice of the unequal distribution of the Swedish land-tax.

There is, however, in Sweden, an assessment of 5 per cent. laid on the net annual value of all estates. But this, though apparently an equal, is, in fact, a very unequal and impolitic tax; inasmuch as it makes no distinction between the income derived from the rent of land properly so called, and that which is really derived from the capital laid out on the land, and as it operates

as an obstacle to improvements. The occupiers of crown-lands in Sweden have long had, and still have, leave to constitute themselves the absolute proprietors of such lands on their paying a sum equal to 6 years' value of the land-tax laid on the land. It is not, therefore, the amount of the burdens falling on the land in Sweden, which, despite the statements to the contrary, are really very moderate, but the influence of the 5 per cent. assessment in discouraging improvements, and, still more, the minute subdivision of the *hemmans*, occasioned by the continued division and subdivision of heritages, in consequence of the law of equal partition among the children of a family, that are the principal obstacles to improvement. Property is, in many instances, divided into such minute portions as to be wholly unsuited to a proper system of cultivation; and the occupiers are often in the poorest circumstances. There are parcels of land of not more than 40 yds. sq., and a Dalecarlian peasant sometimes sells his landed property for 2 or 3 rix-dollars (3s. 6d. to 5s.), the registration of the sale costing as much as the estate!

In some extensive districts there are not, at an average, above 14 acres of arable land to a farm; and in the district of Carlstad, where farms are largest, and agriculture most advanced, the average extent of arable land in each farm may be taken at about 72 acres. At an average of the entire kingdom, the arable land may be estimated at about 24 acres per farm. (*Thomson's Travels in Sweden*, p. 426.)

But, notwithstanding these disadvantages, and those that originate in its backward climate and not very fertile soil, agriculture has made a very material progress in Sweden since 1815. This is partly ascribable to the encouragement afforded by government and to the establishment of model farms, some of which are managed by agriculturists from Great Britain. One of these, in the vicinity of Linköping, on the S. border of the Lake Wener, consists of about 1500 acres, of which about 500 are under the plough. The manager of this farm had in 1839, twenty young gentlemen boarded with him in the house, and 20 scholars of the working class. Government allows him 10,000 dollars a year towards defraying his expenses, and the establishment is said to be alike successful and advantageous. Mr. Stevens, an experienced Scotch agriculturist, who visits Sweden every summer, and assists landed proprietors in laying out their estates, and putting them under an improved system of management, says that "Of late years an enthusiasm has sprung up for the improvement of agriculture among all classes of people not to be equalled in any other continental country. This has been owing in a great measure to the exertions of the Agricultural Societies established within the provinces, and the great interest the landed proprietors now take in the improvement and management of their estates. English and German works on agriculture are studied; improved agricultural implements from Great Britain and other countries are introduced; and in many parts Scotland and Germans are seen directing the plough or conducting the operations of the field." (*Bremner*, ii. 218.)

The best evidence, however, of the improvement and extension of agriculture is to be found in the fact that, previously to 1820, there was generally a large importation of corn into Sweden from Danzig and other parts, whereas that importation has now, in ordinary years, wholly ceased, and there is, on the contrary, a considerable exportation. No doubt a good deal of this improvement is to be ascribed to the more extensive culture of the potato. But, independent of this, the improvement in cultivation generally has been most striking. Mr. Stevens says, "that the necessity under which the population formerly laboured, in the N. parts of the country, of having every now and then to use the bark of trees as a substitute for meal in the making of bread, has been in a great measure obviated; and that both the public and private magazines are completely filled with corn."

Houses in the country in Sweden are mostly constructed of wood; and are roofed with timber, turf, and straw. Gentlemen's houses, however, and houses in towns, are usually covered with tiles. Recently, thick coarse paper prepared with tar has been used for roofing, and is said to answer very well. Slates are very scarce; and Dr. Thomson states that he only saw two houses in the kingdom roofed with slate. (p. 399.)

It is estimated by Forsell, that seven ninths of the whole pop. are employed in agriculture: peasants, proprietors of the soil they cultivate, have been reckoned at 147,874; those who live on land not their own at 1,688,717. Husbandry labourers, holding houses and lands under proprietors, at 470,081; and servants, living in the house with their employers, at 277,496. Masters and mistresses are authorised, by an old law, to inflict summary corporal chastisement on their servants, and no other limit than that they do not kill or maim; and Mr. Laing, founding on this fact, states that servants in Sweden are little better than slaves! But it might have

occurred to him that laws here, as elsewhere, become obsolete; and we have been assured, by those who are thoroughly acquainted with the country, that the corporal chastisement of servants is quite as rare in Sweden as in England, and that they are treated with great kindness. The poverty of the soil, and short duration of summer, require a great number of hands during the season for agricultural employments; but during the remainder of the year, they are comparatively idle. Since 1830, the price of agricultural labour has been about 8d. or 1s. a day in the S. and centre of Sweden; but in the N. it costs 1s. 4d. a day. Labour is generally cheaper in Sweden than in Norway, from there being a greater number of the agricultural classes who are destitute of property. According to Laing, the condition of the middle and lower classes, in Sweden, is much less prosperous than that of the same classes in Norway. In this respect, however, as in many others, he is a suspicious authority; as there can be no doubt that he has represented the condition of the Norwegians under much too favourable, and that of the Swedes under much too unfavourable colours. Indeed, the Swedish peasant appears, even from Laing's account, to be far from being in a distressed situation. He says that, "compared with the cottor or labourer, in Scotland, the Swedish peasant is better provided with physical comforts: he is far better lodged, better fed, and his access to fuel and food generally better." (277.) Rent is, most commonly, some proportion of the produce, and is usually paid in kind, there being but few districts in which it is paid in money. Labourers are frequently paid by getting a piece of land, which they cultivate for themselves, working on the proprietor's domain certain days in the week.

Mr. Cox, one of the best and most trustworthy of travellers, gives the following details with respect to the condition of the Swedish peasantry. "I had frequent opportunities of observing the customs, manners, and food of the peasants. On entering a cottage, I usually found all the family employed in carding, flax, spinning thread, and in weaving coarse linen, or cloth. The peasants are excellent cultivators, and apply the coarsest materials to some profitable purpose; they twist ropes from horse's bristles, horse's manes, and bark of trees, and use skins for bridles. Their food principally consists of salted flesh and fish, eggs, milk, and hard bread. At Michaelmas they usually kill their cattle, and salt them for the ensuing winter and spring. Twice a year they bake bread, in large round cakes, which are strung on files of sticks, suspended from the ceilings of the cottages: this bread is so hard as to be occasionally broken with a hatchet, but is not unpleasant. The peasants use beer for common drink, and are much addicted to malt spirits. In the districts towards the W. coasts, and at no great distance inland, tea and coffee are not unusually found in the cottages, which are procured in great plenty, and at a cheap rate from Gottenburg.

"The peasants are well clad in strong cloth of their own weaving. Their cottages, though built with wood, and only of one story, are comfortable and commodious. The room in which the family sleep, is provided with ranges of beds in tiers (if I may so express myself) one above the other: on the wooden testers of the beds in which the women lie, are placed others for the reception of the men, to which they ascend by ladders. To a person who has just quitted Germany, and been accustomed to tolerable inns, the Swedish cottages may, perhaps, appear miserable hovels; but to me, who had been long used to places of far inferior accommodation in Russia, they seemed comfortable places of reception. The traveller is able to procure many conveniences, and particularly a separate room from that inhabited by the family, which could seldom be obtained in the Polish and Russian villages. During my course through those two countries, a bed was a phenomenon which seldom occurred, excepting in the large towns, and even then, not always completely supplied; but the poorest huts of Sweden were never deficient in this article of comfort: an evident proof that the Swedish peasants are more civilised than those of Poland and Russia." (Cox's Letters, iv. 271-279.)

According to the official returns, Sweden had, in 1837, 385,000 horses; 1,657,976 head of horned cattle; 1,412,689 do. sheep; and 513,392 do. hogs. In general, all kinds of domestic animals are inferior. The horses are every where small. There is a fine breed in the Isle of Öland, not more than 3 or 4 ft. high: these, however, are rapidly decreasing. In the S. prov., the number of horses, as compared with the pop., is much greater than in France, or even in England; there being, it is said, in Scania, 243 horses to every 1000 inhabitants. As we proceed N., the number of horses diminishes; and in Sweden-Lapland they disappear altogether, their place being supplied by rein-deer, of which some proprietors possess 1,000 head. In Lapland, the rein deer and dog are the only domestic animals. Swedish black cattle are also small; the best are those of E. Gothia and Dalecarlia; in summer they are driven to

the mountains, where *chalets*, similar to those of Switzerland, are constructed. The sheep-folds are well kept, and government has endeavoured to improve the breeds by crosses with those of Spain, France, England, and Saxony. Sheep are not reared N. of lat. 63°; goats thrive as far as lat. 65°. (*Journal de Travaux Statistiques, &c.*, p. 131-143; Laing, p. 266-272.)

*Fisheries*, form a very considerable branch of industry. The herring fishery on the W. and S. coast commenced in 1740, about which time herrings began to appear in large shoals on the coasts. The quantities actually taken increased until 1798, since which they have decreased; the place of the herring being now supplied by the streamling, a fish about the size of the sprat, but of much finer flavour. From 1790 to 1796, the towns of Gottenburg, Kongsö, and Marstrand disposed of 1,972,214 barrels salt herrings, and 261,571 hhds. fish-oil, which fetched together 480,000*l.*, about 3-4ths being sold to foreigners. But since 1805, the average produce of the fishery has not exceeded 2,000 barrels, the herring having, in a great measure, abandoned the coasts. The streamling is cured like the herring, and is often eaten raw out of the pickle; it is extensively used in Finland and the N. of Russia, and forms a favourite dish even with people of condition. The principal streamling fisheries are on the coasts of the Gulphs of Finland and Bothnia. The principal salmon fishery is at Dyförs, on the Klaröf, a river which falls into the Lake Wener. The salmon fisheries of Norkopping, Gefle, and Hernösund, are also very productive. A company in London employs two packet-boats, with wells in the bottom, in trading to Gottenburg for lobsters, which are brought there for 3*gd.* or 8*d.* each.

*Mines*.—The mines of Sweden, though inconsiderable as compared with those of this country, are a considerable source of national wealth. They are principally situated in the central provinces, which have no fewer than 261 out of the 586 mines said to exist in the kingdom. Swedish iron is of very superior quality, and that of the Dannebrog mines is especially well fitted for conversion into steel; but, owing to injudicious restrictions and the want of coal, the production in Sweden was supposed (including what is consumed and what is made for home consumption without a license) to exceed 85,000 or 90,000 tons bar iron, of which about 70,000 are exported. In 1839 we imported 17,049 tons of Swedish iron. The copper mines produce, in all, only about 750 tons a year; the metal is not so good as that of England, and is impregnated with iron. Fahlun, the chief mine, has long been in a declining state, the number of workmen at present employed not exceeding 500. The works of this mine are conducted entirely by water-power, and are remarkable for their completeness; connected with them is a manufactory of sulphuric acid.

The smelting furnaces and iron works are licensed to produce certain quantities, some being as low as 50 tons, and others as high as 400 or 500 tons; and some of the bar iron works have licenses for 1000 tons each. These licenses are granted by the College of Mines, which has a control over all iron works and mining operations. The iron masters make annual returns of their manufacture, which must not exceed the privileged or licensed quantity, on pain of the overplus being confiscated. The college has established courts of mines in every district, with supervising officers of various ranks. All iron sent to a port of shipment, must be landed at the public weigh-house, the superintendent of which is a delegate of the college; so that it is impossible for an iron master to send more iron to market than his license authorises. It is true that sales are made to inland consumers at the forges, of which no returns are made out, and in so far the licenses are exceeded; but it is not supposed that the quantity so disposed of exceeds a few thousand tons a year. Every furnace and forge pays a certain annual duty to the crown. Its amount is fixed by the college when the license is granted; and care is taken not to grant the license to any one unless he have the command of forests equal to the required supply of charcoal, without encroaching on the supply of this material, required for the existing forges in the neighbourhood. As the supply of pig-iron is limited to the quantity licensed to be made, the college, in granting new licenses to bar-iron works, always takes into consideration how far this may be done without creating a scarcity of pig-iron. Hence, the erection of new forges depends—1st, on having a supply of charcoal, without encroaching on the forests which supply your neighbours; and 2d, on the quantity of pig-iron which the college knows to be disposable. The courts of the mines decide all disputes that arise among the iron masters regarding the exceeding of their licenses, encroachments, &c.; an appeal to the college lying from their decision, and ultimately to the king in council, or to the supreme court of the kingdom.

It is needless to dwell on the impolicy of such regulations. No doubt it is quite right for government to interfere to prevent the waste and destruction of the forests; but having done this, it should abstain from all other inter-

ference, and leave every one at liberty to produce as much iron as he may think proper. Mines of any importance are usually held by a society of shareholders. Some of them are only worked occasionally; and, as the labour is performed by peasants, who live ostensibly by husbandry, it is impossible to form any correct estimate of the numbers engaged in mining industry.

**Manufactures.**—For many ages, Sweden had none of any importance; the Hansatic towns took away its raw materials, and re-exported them manufactured to the

country; the other manufactures were then, as they still are in great part, domestic. But about the middle of the 17th century, various manufactures, including those of glass, starch, brass, pins, silk fabrics, leather, soap, steel, and iron articles, besides printing-presses and a sugar refinery, were established: the workers in these establishments were mostly from Germany and the Low Countries. In 1771, there were in Sweden 885 manufactories; in 1824, 1,177; and in 1831, 1,184, employing 12,143 hands, exclusive of miners. We subjoin an official

**ACCOUNT of the Number of Factories, Looms and Workmen, in each Department of Manufacturing Industry in Sweden, in 1838 and 1839, and of the Value of the Produce in each.**

Sweden has but few facilities for the formation of great manufacturing establishments; but, owing to the long winter nights, during which most out-of-door occupations are necessarily suspended, she has great facilities for the carrying on of domestic manufactures; and, in point of fact, the Swedish peasantry not only supply themselves with most descriptions of agricultural implements and household furniture, but with nearly all the coarse woolen, linen, and cotton goods, required for their ordinary use. No foreign or factory-made goods, however cheap, can supersede or materially interfere with this domestic manufacture; for, as the people would otherwise be idle, its products may literally be said to cost them nothing. Several factories have, however, been established in Sweden for the production of the finer descriptions of woven fabrics, some of which have had considerable success. The government of Elfsborg is the grand seat of the domestic manufactures of cotton in Sweden. A factory recently erected in this government, driven by water, has 150 power-looms employed in the production of cambrics and shirting; and it is at present (1842) in the course of being greatly enlarged. We subjoin an

**ACCOUNT, showing the Quantities of Cotton Goods made in Sweden during the Ten Years ending with 1840, distinguishing those manufactured in regular Factories from those made by the Peasantry, in the Government of Elfsborg:—**

Years.	Cotton Goods manufactured in regular Factories.	Cotton Goods made by the Peasantry in the Government of Elfsborg.	Total of Cotton Goods produced.	Observations.
1831	<i>Alnars.</i> 577,099	<i>Alnars.</i> 1,277,749	<i>Alnars.</i> 1,854,878	1. The Swedish <i>aln</i> is equal to about two thirds of an English yard. 2. Beside the goods measured by the yard, a considerable quantity of cotton goods, rated by the piece, is annually made, such as shawls, handkerchiefs, waistcoats, &c. 3. By the tariff of 1830, which took effect on the 1st Jan. 1831, several articles of cotton previously prohibited were allowed to be imported. 4. The tariff of 1835, which came into effect on the 1st Jan. 1836, gave additional facilities for importation.
1832	639,406	2,046,555	2,685,961	
1833	945,752	2,646,307	3,592,057	
1834	945,192	2,461,119	3,406,311	
1835	990,574	2,513,808	3,504,382	
1836	953,273	3,100,666	4,053,939	
1837	1,081,083	4,015,545	5,096,628	
1838	1,105,983	3,831,294	4,937,277	
1839	1,218,249	4,091,226	5,309,475	
1840	1,296,822	4,685,511	5,982,333	

Of the woollen manufactures, that of cloth is the principal. It is well made, chiefly of the wool pro-

duced in the country; but being principally intended for domestic use, and the cultivators making most of what they require, the sale is but small. Norrköping and Stockholm are the towns in which the largest quantities are made. Foreign cloths are prohibited; but the contraband trade is extensive. The manufacture of other woollen stuffs is confined to flannels, serges and bombazines, which were formerly prohibited, are now imported in considerable quantities. Handkerchiefs, which form the usual head-dress of the women, form the principal produce of the silk manufacture, though taffetas, gros de Naples, levantines, and ribands, are also produced. The manufacture has been a good deal improved by the introduction of Jacquard looms from France. The manufacture of sail-cloth is increasing. The principal glass factory is at Bromo, in Westrogothia. Ekelsstuna is the principal seat of the hardware and cutlery business, being a sort of miniature Sheffield: fire-arms are made in it at a factory established by government. The quality of Swedish paper has lately been much improved, and the quantity so much increased that considerable supplies are now sent to Denmark and Germany. The distillation of corn brandy has been constantly increasing since the reign of Gustavus III. In 1772, government, in order, as is supposed, effectually to suppress drunkenness, prohibited distillation; but, as night have been foreseen, the increase of smuggling and clandestine distillation rendered the prohibition useless, and made it be withdrawn. The Swedes are great consumers of ardent spirits. Every proprietor and occupier of land has a right to distil spirits; the size of the still and the amount of the duty depending on the value of the property. Mr. Stevens states that, in 1829, there were 167,744 stills going, which were calculated to make, within the year, about 30,000,000 galls. worth as many rix-dollars, and paying a duty of 434,396 dollars, a little more than a farthing a gallon! As the distiller is not bound to use any particular kind of grain or malt, a considerable quantity of potatoes is used in distillation. We understand that, in this respect, but little change has taken place during the last ten years; but, taking the consumption at only 25,000,000 galls, it gives, taking the population at 3 millions, an average annual supply of 8½ galls. to every individual, young and old, being about three times the average consumption of the people of Scotland. This is not a new habit in Sweden. "*Le Suédois est sobre, sur tous les points, à l'exception de l'eau de vie. Cette funeste habitude commence dès l'enfance, et doit être regardée comme une des causes de la dépopulation de la Suède.*" (*Voyage de Deux Français dans le Nord de l'Europe*, li. 42.) A porter brewery is established near Gottenburg, but the demand for its produce is very limited, not exceeding

5,000 hhds. a year. Excepting oak timber and hemp, Sweden possesses every material necessary for the construction of ships. Salt-petre, potash, and tar, are among the secondary articles of manufacture. There are two establishments for the instruction of persons intended for trade or manufacture, one at Stockholm, and the other at Gottenburg. A school for mining is established at Fahlun. Schools, where gratuitous instruction is given in navigation, have been established in five of the principal sea-ports; and no individual can be appointed master or mate of a merchantman without passing an examination in some of these schools, and receiving a certificate of his ability properly to discharge the duties of such situations.

*Trade.*—The trade of Sweden, which, from the situation of the country, must necessarily be of limited extent,

has been reduced below even its natural bounds by the policy of the government in endeavouring to bolster up manufactures. Latterly, however, this system has been relaxed, and the trade and industry of the country have both experienced the beneficial influence of the more liberal policy that has been adopted. The exports consist almost wholly of raw produce, of which iron and timber, especially the former, are by far the most important articles: next to them are copper, alum, corn, tar, cobalt, &c. The imports principally comprise sugar, coffee, and other colonial products; salt, wines, silk, and wool; cotton, cotton twist, and cotton stuffs; hemp, hides and skins, oil, &c. The foreign trade is principally carried on with Great Britain, the United States, Holland, Hamburg, Denmark, &c. It principally centres in Stockholm and Gottenburg. We subjoin an

ACCOUNT, exhibiting the Official Value of the Exports from and Imports into Sweden, and the Amount of Customs' Revenue for the Ten Years, ending with 1840.

*Roads, Posting, &c.*—The main roads to and from Stockholm are generally excellent and well kept; but the cross roads are comparatively neglected. Land-holder is bound to keep in good repair that part of the public road which passes through his possessions; but it is needless to say that it is very difficult to enforce this regulation. The system of posting, though affording every facility for the traveller, is onerous on and injurious to the agriculturists. On all the principal routes, post-stations are established every 7 or 10 m. apart, to which the farmers and peasants of the district are compelled to furnish horses and a driver to the next post-station, at a very low rate, for any traveller who may require them. The station-master has the privilege of being the only innkeeper out of the towns; but he also is obliged to keep horses to perform the same duties as those of the farmers on certain days in the week. Severe penalties, and even corporal punishment, are inflicted on the peasantry for any default in the fulfilment of this duty. The rate of hire paid for each horse is equivalent to about 1d. per Eng. mile. (*Lange*, p. 203—205, &c.)

*Canals.*—The formation of a system of internal navigation that should connect the Cattegat and the Baltic, has long engaged the attention, and occupied the efforts, of the people and government of Sweden. Various motives conspired to make them embark in this arduous undertaking. The Sound, and other channels leading to the Baltic, being commanded by the Danes, they were able, when at war with the Swedes, greatly to annoy the latter, by cutting off all communication by sea between the E. and W. provs. of the kingdom. And hence, in the view partly of obviating this annoyance, and partly of facilitating the conveyance of iron, timber, and other bulky products, from the interior to the coast, it was determined to attempt forming an internal navigation, by means of the river Gotha, and the lakes Wener, Wetter, &c., from Gottenburg to Soderkoeping on the Baltic. The first and most difficult part of this enterprise was the perfecting of the communication from Gottenburg to the lake Wener. The Gotha, which flows from the latter to the former, is navigable, through by far the greater part of its course, for vessels of considerable burden; but, besides other obstacles less difficult to overcome, the navigation at the point called Trollhetta is interrupted by a series of cataracts about 112 ft. in height. Owing to the rapidity of the river, and the stubborn red granite rocks over which it flows, and by the perpendicular banks of which it is bounded, the attempt to cut a lateral canal, and still more to render it directly navigable, presented the most formidable obstacles. But, undismayed by these, on which it is, indeed, most probable he had not sufficiently reflected, Polhem, a native engineer, undertook, about the middle of last century, the Herculean task of constructing locks in the channel of the river, and rendering it navigable. Whether, however, it were owing to the all but insuperable obstacles opposed to such a plan, to the defective execution, or deficient strength of the works, they were wholly swept away, after being considerably advanced, and after vast sums had been expended upon them. From this period, down to 1798, the undertaking was abandoned; but in that year the plan was proposed, which should

have been adopted at first, of cutting a lateral canal through the solid rock, about 1½ m. from the river. This new enterprise was begun under the auspices of a company incorporated in 1794, and was successfully completed in 1800. The canal is about 3 m. in length, and has about 6½ ft. water. It has 8 sluices, and admits vessels of above 100 tons. In one part, it is cut through the solid rock to the depth of 72 ft. The expense was a good deal less than might have been expected, being only about 80,000*l.* The lake Wener, the navigation of which was thus opened with Gottenburg, is, as already seen, very large, and is encircled by some of the richest of the Swedish provinces, which now possess the advantage of a convenient and ready outlet for their products.

As soon as the Trollhetta canal had been completed, there could be no room for doubt as to the practicability of extending the navigation to Soderkoeping. In furtherance of this object the lake Wener has been joined to the lake Wetter by the Gotha canal, which admits vessels of the same size as that of Trollhetta; and the prolongation of the navigation to the Baltic from the Wetter, partly by two canals of equal magnitude with the above, and partly by lakes, is now completed. The entire undertaking is called the Gotha Navigation, and deservedly ranks among the very first of the kind in Europe. Besides the above, the canal of Arboga unites the lake Hielmar to the lake Moelar; and, since 1819, a canal has been constructed from the latter to the Baltic at Soderfelge. The canal of Stroemsholm, so called from its passing near the castle of that name, has effected a navigable communication between the prov. of Dalecarlia and the lake Moelar, &c. (For further details, see *Core*, iv. 253—266, and v. 58—66; *Thomson's Travels*, p. 35, &c.)

*Currency, &c.*—The currency consists almost wholly of paper, and though, since 1835, bank notes may be freely exchanged for paper, there is little or no demand for the latter. The *rix-dollar banco*, in which all mercantile transactions are carried on, is worth about 2*sd.* sterling; the *riks-geld dollar*, used as the medium of exchange in ordinary transactions, being worth two thirds the former, or 13*d.* *Rix-dollars banco* are exchanged for rix-dollars specie, at the rate of 2½ the former for one of the latter; and all rix-dollars are divided into 48 skilling. The notes in circulation vary from 8 skilling to 500 dollars banco. Such is the prejudice in favour of paper money, that, in the small towns and remote districts, coins, excepting those of copper, to a small value, are often refused as payment.

*Measures of Length.*—The Swedish foot = 11·684 Eng. in.; the alm = 2 feet; the fathom = 3 ell; the rod = 8 ell.

*Public Finances.*—In 1840, the budget of revenue and expenditure was fixed for that and the following years, till the next meeting of the diet, at 10,742,588 rix-dollars banco, or 895,240*l.* sterling. The amount is derived as follows:—

Land-tax and other perpetual revenues	Rix-dollars banco.
Customs, stamps, and other taxes, voted at every diet	4,566,380
	6,176,500
Total	10,742,588

But the land-tax and other perpetual taxes being fixed long ago, constitute, in fact, a portion of the property of the country belonging to the state, and cannot justly be regarded as taxes. Hence it follows, that the total sum levied in the shape of taxes for public purposes, exclusive of the maintenance of the indolent soldiers (see *post*), and other local burdens, amounts to only 6,176,500 rik-dollars banco, or 544,708*l.* sterling; so that, despite the statements of Laing and others to the contrary, there cannot be a doubt that Sweden is at this moment (1842) the most lightly taxed country of Europe.

The Government is a monarchy, hereditary in the male line, with a representative diet, one of the most ancient in Europe. The king must be a Lutheran, and his person is inviolable. He is assisted by a state council, composed of 10 members, including the ministers of justice, foreign affairs, war, marine, interior, finance, and public worship, and three councillors. The army and all foreign relations are under the immediate control of the king; but he cannot decide on any matter touching any other branch of government, without the concurrence of the council. He nominates to all appointments, both military and civil; concludes foreign treaties, declares war, and makes peace; and has right to preside in the supreme court, and to grant pardons. The princes of the blood-royal are excluded from all civil employments. The different departments of justice, war, marine, mines, commerce, &c., are called *colleges*.

The diet, or representative assembly, consists of four separate chambers, consisting respectively of deputies from the nobility, clergy, burghers, and peasants or cultivators; the latter class having acquired the privilege of sending representatives towards the end of the 13th century. Since 1820, the proprietors of iron works have obtained the privilege of sending three deputies to the chamber of burghers to watch over their interests. The king nominates the presidents or speakers of the chambers of nobles, burghers, and peasants; the archbishop of Upsal being president, *ex officio*, of the chamber of clergy. The diet is convened every five years, and usually sits for three or four months, but occasionally, as in 1840-41, for a much longer period. The head of every noble family is, by law, a member of the chamber of nobles; but, notwithstanding that the nobility include in all about 13,500 individuals, it is but seldom that the chamber of nobles is attended by above 500 individuals. The clergy have 64 deputies, the burghers 85, and the peasants generally from 140 to 150, chosen by the arrondissements; the deputies for the clergy, burghers, and peasants, receive salaries during the sitting of the diet from their constituents. No new tax or impost can be established without the concurrence of the diet; nor can any modification of the constitution be legally effected without the concurrence of all the chambers composing the diet.

The four chambers deliberate and vote separately; but all questions must, previously to their decision, be referred to the chambers, by a referred standing committee chosen at the commencement of the diet, consisting of an equal number of members from each order. In constitutional questions, which cannot be decided in the same diet in which they are raised, the unanimous consent of the four orders is required, but in other matters the decision of three orders is valid. When two orders are opposed to two, the subject, according to its nature, is either dropped, or referred to the decision of a special committee, composed of 30 members of each order. Differences on minor points are adjusted by the committee, to which the matter was originally referred.

In most cases the decrees of the diet must be submitted to the king, who has an absolute veto; and it is a curious circumstance, peculiar to what M. de Pradt called the *semi-constitutional* government of Sweden, that frequently the king has refused his sanction to the resolutions of the diet, and the diet has negatived the proposals of the king, without occasioning a change of ministry, or exciting any deep feeling of animosity on either side. The king used his privilege of the veto to a great extent in negativing measures agreed to by the diet of 1840-41. This anomaly is increased by the absolute legislative power, which the constitution confers on the king in all matters of internal administration and police, in regard to which the diet merely presents addresses and petitions expressive of their views and wishes.

Previously to the diet held immediately subsequent to the revolution of 1809, the nobility enjoyed several valuable privileges and fiscal immunities. These, however, they then wisely surrendered, stipulating only for the general freedom of trade, externally and internally—a stipulation which has not hitherto been fully carried out. The division of the diet into separate chambers, representing particular orders of the state, is, therefore, less objectionable now than formerly, though it be still necessarily productive of considerable inconvenience.

The chamber of clergy, though said by Mr. Laing to be the most enlightened and independent order of the

diet, have interests to support that are in many respects peculiar, and which may sometimes, perhaps, be opposed to those of the public, at the same time that they are mostly all more or less dependent on the crown.

The chamber of burghers consists of representatives of the guilds, trades, and corporations of the different towns. These, as every body knows, are possessed of certain franchises and immunities which go to obstruct competition, and, consequently, to enhance the cost of the articles furnished by the privileged class.

The deputies of the peasants represent by far the greater number of the people, though not the greater portion of the property of the country; and are, themselves, seldom in such circumstances as to enable them to act a really independent part. And hence, in consequence partly of the constitution of the diet, which opposes the greatest obstacles to all organic changes, how expedient soever, and partly to apparent rather than real inequalities in the privileges of the different orders, a good deal of discontent prevails in Sweden. It is, indeed, hardly possible that the present complicated and vicious system should be able to maintain its ground much longer; and the best way to avoid the recurrence of another of those revolutions so frequent in Swedish history, will be to adopt measures for obviating the defects inherent in the existing political organisation of the country, and for making the diet a representation, not of class interests, but of the intelligence and property of the kingdom. Still, however, there can be no doubt, notwithstanding the defects in its constitution, that the country has made a rapid progress during the last twenty years, and that there is every prospect of this progress being continued.

*Justice.*—The 24 *län*s are subdivided into 117 *fogderier*, or districts, each comprising one or more *herades*, or cantons. At the head of each *län* is placed a governor, charged with the civil and military jurisdiction, and the receipt of the revenues. Every canton is under the superintendence of a *kansman*, who is the executive officer of the administration, and subordinate to a *kron-fogde*, or kind of sub-prefect, with authority over four or five cantons. There are 264 courts of original jurisdiction, or *herad* courts, with a judge presiding over each. These courts sit three times a year, and 12 peasants are elected by the peasantry of each *herade*, who serve as jurymen for two years. There are 3 royal judicial courts; viz. at Stockholm, for the upper or N. provs.; at Jönköping, for the middle; and at Kristianstad, in Scania, for the S. provs. The first has subordinate to it, 7 inferior tribunals, the second 6, and the third 3. These are the highest courts of appeal from the inferior tribunals, and have alone jurisdiction in all criminal cases affecting life or property, as well as in all affairs above the value of 4*l.* The decisions of these courts are subject to the review of the supreme court of justice, composed of 12 councillors, and presided over by the minister of justice. There are also *hermanns' courts*, to which appeal is first made from the inferior tribunals, but they are generally considered superfluous establishments. Questions of divorce are brought before the ecclesiastical courts. Although the forms of justice be little complicated, the decisions of the courts are often long delayed. A new civil and criminal code is at present in course of preparation.

*State of Crime, &c.*—Sweden being almost wholly an agricultural country, with but few manufactures, and only one large town, and having, also, a constitutional government, and a widely diffused system of public instruction, it might be expected, *a priori*, that it would exhibit a high state of moral feeling, and a remarkable paucity of crime. Such, however, we regret to say, is far from being the case; and though there can be no doubt that the representations as to the depravity and immorality of the Swedes, given in Mr. Laing's work, are far too highly coloured, still it must be confessed that crime and immorality prevail to a extent not easily accounted for. According to the official returns published in the *State Gazette*, the number of persons prosecuted for criminal offences before all the Swedish courts, in the year 1835, was 26,275; of whom 21,262 were convicted, 4,915 acquitted, and 98 remained under examination. In 1836, the total pop. of Sweden was 2,983,144 individuals. In this year, therefore, 1 person of every 114 of the whole nation had been accused, and 1 in every 140 persons convicted, of some criminal offence. By the same official returns it appears, that in the 5 years from 1830 to 1834 inclusive, 1 person in every 49 of the inhab. of the *towns*, and 1 in every 176 of the rural pop., had, on an average, been punished each year for criminal offences. In 1836, the number of persons tried for criminal offences, in all the courts of the kingdom, was 26,293; of whom 22,292 were condemned, 3,688 acquitted, and 945 under trial or committal. The criminal lists of this year are stated to be unusually light; yet they give a result of 1 person in every 112 of the whole pop. accused, and 1 in about every 134 convicted, of criminal offences; and, taking the pop. of the towns and the rural pop. sepa-

ately, 1 person in every 46 individuals of the former, and 1 in every 174 individuals of the latter, have been criminally convicted within the year 1836." (*Laing's Sweden*, p. 109, 110.)

This certainly is an immense amount of crime; but, when examined, it is found to be far less than it appears to be. In Sweden the police interferes with every thing; and offences of the most venial kind, and which, in fact, cannot, with any propriety, be called crimes, are, notwithstanding, punished as such, and appear in the list of criminal cases. Thus, if the peasantry neglect to repair the roads of the parishes to which they belong, or if they neglect or delay to bring horses, when required, to the posting stations, they are subjected to fine and imprisonment, and included in the list of criminals. In towns, in like manner, the neglect of sweeping chimneys, repairing and cleaning streets, &c., are reckoned criminal offences; as are drunkenness, indecency, abuse of a parent, or of a wife or husband, and so forth! Hence, it is obviously necessary, in order to the institution of any thing like a fair comparison between crime in Sweden and other countries, to strike off from the list of criminals all that numerous class guilty only of petty offences, not noticed, except in Sweden, and to include those only that are included in the criminal returns of the countries with which it is compared.

But, notwithstanding this deduction, the extent of crime in Sweden, though nothing like what it appears to be at first sight, is still unusually great. This is shown by the following specification of the criminal offences committed in Sweden in 1837, 1838, and 1839, omitting all of minor importance, or that can in any way be regarded as cases of police:—

	1837.	1838.	1839.
Blasphemy	1	2	1
Murder (by violence)	35	24	35
— (by poison, &c.)	4	7	4
— (with arson, &c.)	0	1	0
— (child)	13	12	12
— (abortion)	8	18	15
Arson	3	5	5
Burglary and highway robbery	6	8	9
Swindle	11	15	15
Unsuitable offence	12	9	17
Indecent, &c.	11	17	4
Perjury	150	187	159
Forgery	0	0	1
Idiocy	0	0	0
Total	255	309	285

In addition to the above there were, in 1837, 2,456 cases of theft; in 1838, 3,200; and in 1839, 2,814 do. But there are no means of distinguishing, in these cases, between petty or police cases, and those of a graver description. (*Art. on Sweden*, Foreign Quarterly Review, No. 55, p. 169.)

The frequency of forgery in so poor a country is a consequence of the general use of paper money, which supplies at once the greatest temptations to and facilities for the commission of the crime. On the whole, however, it is very difficult to give any satisfactory explanation of the causes of the many crimes, some of them of a very atrocious kind, that take place in Sweden. A considerable influence has been ascribed, and with justice, to the obligation imposed on peasants, without any regular occupation or trade, of finding sureties, or bondsmen, to guarantee their payment of the taxes due to government, or else of their being subjected to imprisonment. Great stress has, also, been laid on the defective and crowded state of the prisons and houses of correction, in which, as already seen, great numbers of persons who have committed the most trifling offences, are shut up with the greatest criminals. The prevalence of dram-drinking is, no doubt, also a most prolific source of crime; as is the interruption given to the labours of the peasantry, and the idle habits generated by the posting system; and, more probably than any other, the increase of poverty arising out of the continued subdivision of the land, and the want of an efficient system for the support of the unemployed and necessitous poor.

The proportion of illegitimate to legitimate births is higher in Sweden than in most other countries. Mr. Laing has given some statements illustrative of what he considers to be the cause of this state of things. We doubt, however, whether they be entitled to much weight; and, in point of fact, a good many of the unions which give rise to illegitimate births are really equivalent to a species of marriage, though without the sanction of the law. A good deal, also, is to be ascribed to the establishment of foundling hospitals in the capital and other great towns. But, whatever may be its causes, this demoralisation is not, as Mr. Laing seems to have supposed, of recent origin. "Il y a beaucoup de libertinage dans les grandes villes; il commence quelquefois avant l'âge de 12 ans, et il est poussé à l'excès jusqu'à 18 ou 20. Alors les jeunes personnes deviennent sages, c'est-à-dire qu'elles n'ont plus qu'un amant; et après quelques années, elles se marient, ont avantageusement pour l'ordinaire; les hommes ne

font nulle attention à la vie antérieure. (*Voyage de Deux Français*, li. 422.)

It is only, however, by attending to the statistical returns of commitals and convictions, that a traveller in Sweden is made to suspect the existence of any considerable amount of immorality. "Whatever," says Mr. Laing, "may be the want of morals in this country, there is no want of manners. You see no blackguardism, no brutality, no revolting behaviour. You may travel through the country, and come to the conclusion that the people are among the most virtuous in Europe." Mr. Laing further tells us that though he travelled slowly across the country, stopping every eight or ten miles at the houses at which the people are supplied with spirits, he only saw one party of peasants a little tipsy, but by no means drunk. We suspect, however, that Mr. Laing's optics had been somewhat defective, or that he had been too squeamish to look into the places or join the parties where intoxication was most likely to prevail. At all events, other and later travellers tell a very different story. There cannot, in fact, be a doubt of the frequency of drunkenness, notwithstanding it is liable to be punished by a fine of about 3s., or six days' hard labour in the house of correction.

*Army.*—The Swedish army comprises three different kinds of troops; viz. enlisted soldiers, always on pay and duty, *infanta* soldiers, and the conscription, or local militia. The numbers of the two first are seen by the following table:—

Enlisted Troops.		Infanta Force.	
Horse Guards	1,000	Cavalry	7,000
Artillery	5,116	Infantry	24,500
Infantry	2,200		
Total	8,316	Total	31,500

The militia is roughly estimated at about 95,000 men. The *infanta* system, which is peculiar to Sweden, originated with Gustavus Adolphus, was permanently established by Charles XI., and has continued, with some trifling modifications, in full operation to the present day. "To understand it fully, it must be borne in mind that the whole of Sweden is divided into military districts or provinces, each of which is bound to contribute a certain number of men to this branch of the national force. Each holder of as much crown land as forms a *hemman* is bound to provide a man, to whom he assigns a croft of land, with a cottage, cowhouse, and barn, and an annual money allowance of about 1*l.* 8s., one suit of rough clothes, and two pair of shoes. The croft is cultivated by the soldier himself while at home, but during his absence on service with the army at the annual reviews, or on any government employment, it is cultivated by the landholder for behoof of the family. When the soldier dies, his widow and children transfer the house, &c., to his successor, whom the landholder, under a considerable penalty, is bound to provide within three months. To furnish a cavalry soldier with his horse, &c., two or three *hemmans* are united; but both in regard to cavalry and infantry, the provinces are divided in such a manner that the colonel of each regiment shall have his farm (also provided in the way just explained) as nearly as possible in the centre of the regiment; a captain in the centre of his company; and so down, through the lowest non-commissioned officers. The farms occupied by officers are large and valuable. The landholders are bound to transport the men, with their baggage, to the annual reviews, and to allow them so much a day for their expenses. Government furnishes the uniforms, and in time of war gives the men higher pay, which is afterwards raised from the landholders. In time of peace, these soldiers are turned to excellent account, by employing them on roads and other public works; and when not required for these purposes, they are bound to labour for the respective landowners, at the current rate of daily wages. The number of officers in this corps, as, indeed, in the whole Swedish army, is unusually small, there being only one officer to about every 40 men, while, in France and Austria, there is an officer to every 12." (*Brenner*, 408.) Sundays are the usual days of inspection. Mr. Brenner and other travellers speak in the highest terms of the fine appearance of the Swedish troops.

The militia consist entirely of foot soldiers, provided with clothing, arms, &c., by the government. The artillery train is composed of about 220 pieces of various calibre.

The chief arsenals are at Stockholm, Gottenburg, and Christianstad. The principal fortresses are, Wanas, on the lake Wetter; Waxholm, near Stockholm; Carlscrona, and Christianstad. In the island of Gothland, where there are no lands fit for the maintenance of the troops, all the male inhabs. between the ages of 20 and 50 may be called on to take arms in defence of the island, if attacked.

The annual expense to the country of an *infanta* regiment of 1,200 men, amounts to about 8,500*l.* sterling. The whole cost of the army and fortresses, exclusive of

the maintenance of the *indelta* troops, is fixed in the budget of 1840 at 4,106,110 rix.-doll. banco, equivalent to about 342,000*l.* a year.

*Navv.*—The naval force of Sweden consisted in 1840 of 10 ships of the line, 8 frigates, 8 brigs, &c., and 247 gunboats, 3 royal yachts, and sundry steam-vessels. The permanent seamen at command of the government may amount to about 8,000 men. They are maintained in the same way as the *indelta* troops, by assignments of lands. Together with conscripts, the whole naval force may be augmented to about 34,000 men. The Swedes are excellent sailors, and especially skilful in the management of small craft. The chief naval stations are Carlscrona, Stockholm, and Gottenburg. The annual expense of the navy amounts to 1,331,430 r. doll. banco, or about 110,000*l.*

*The Religion of the state*, and of nearly all the Inhabs., is the Lutheran; there being only about 2,000 Catholics, and under 1,000 Jews. There is one archbishopric, that of Upsala; and 11 bishoprics. The functions of public worship are exercised by about 3,000 ecclesiastics. The higher order of the clergy are nominated by the king from lists presented by each diocese: the election of curates and others of the inferior order, is left to the people at large. The revenues of the clergy generally are derived from church lands, &c.; the bishops receive, in addition, a tithe on corn, and one from the inhabs. of the four or five parishes surrounding the episcopal residence. The revenue of the archbishop of Upsala does not exceed 800*l.* a year. The richest bishopric, that of Linköping, is worth about 560*l.* a year. The bishop of Hernoas has scarcely 240*l.* a year. The clergy are an important body.

All sects are tolerated in Sweden, but with this important restriction, that Lutherans only can be advanced to any employment under the state. According to Laing, the people, generally speaking, are extremely superstitious.

The churches are generally well kept, and great attention is paid to the outward forms and ceremonials of religion. Much more liberality is shown towards Jews in Sweden than in Norway; and there are synagogues at Stockholm, Gottenburg, Norrköping, and Carlscrona. A dissenting sect called *Läsare*, or readers, has lately become very numerous in Lapland and the N. parts of the country. "In Sweden, generally, all kinds of amusements begin the moment that public worship is over—in the country, dancing and drinking; in the capital and large towns, theatres, equestrian exhibitions, rope-dancing, balls, &c. In fact, the Swedes appear to regard the sabbath as terminated with the service of the day; but to atone for shortening it so much, they commence its observance, at least in the rural parishes, at six o'clock on the Saturday evening. As soon as that hour strikes all week-day labour ceases, the whole family clean themselves, and the devotions of the evening are begun." (*Brenner's Excursions in the North of Europe*, ii. 22.)

*Public Instruction.*—Elementary instruction is in a very advanced state in Sweden. Every adult person must give proof of ability to read the scriptures before he can exercise any act of majority; and notwithstanding the dispersion of the pop., it is said that there is not one individual in 1,000 of the adult pop. unable to read. Parents in the humblest circumstances are all able to give instruction in reading and writing to their children. No qualification is required in a teacher by the local authorities other than good character, it being left to the public to decide as to the capacity of the teacher, and the merits of his modes of instruction.

There are two universities, viz. those of Upsal and Lund, at either of which the instruction is of a very superior description. Subordinate to these are the gymnasia or provincial high-schools, in which are taught the branches of education necessary for the students before entering the universities. In 1830 there were 3,060 establishments for elementary instruction, attended by 11,195 pupils, of whom 572 belonged to the class of nobles, 1,410 to the clergy, 3,399 to public functionaries, 2,899 to burghers, and 2,815 to the peasantry. The budget for 1842 and subsequent years includes the sum of 82,407*l.*, appropriated for the use of the ecclesiastical department, universities, schools, &c.

An academy for perfecting the Swedish language was founded by Gustav III. in 1786, and a royal academy of sciences originally established by Linnaeus. There are special schools for the military and naval service, and others of history, antiquities, *belles-lettres*, &c.

*Public Press.*—The press is free by law, every man being responsible for what he publishes. In 1812, however, a temporary power for the seizure of periodical publications was granted by the diet, and has been since continued, notwithstanding the efforts to obtain its abolition. Upwards of 80 newspapers are published in the kingdom, 19 of which are issued in Stockholm. Several, however, consist almost entirely of advertisements, which, as they pay no tax, are very numerous, and are employed as the means of transacting business among

even the lower orders. In all offences of the press the same jury officiates both as grand and petty jury, there being no revision or appeal from the first decision of the court.

*Arts, &c.*—The arts and sciences have been successfully cultivated in Sweden. Antiquities formed the first objects of national research; but their study was superseded in the time of Linnaeus and Scheele by that of natural history and chemistry. The reign of Gustavus III. was the most flourishing period of the arts and literature. The Swedes annually import from 6,000*l.* to 7,000*l.* worth of foreign books, mostly French, English, and German. Among distinguished authors and men of science, Sweden has produced Linnaeus, Tycho-Brahe, Scheele, Bergman, Puffendorf, Berzelius, &c. The taste of the ancient Scandinavians for music appears in the present day to have descended to only the higher and middle classes. At Stockholm there is an opera, which, as well as the theatre at Gottenburg, is regularly open during a part of the year.

*Races.*—With the exception of a few Finns and Lapplanders, in the more northerly parts of the kingdom, the inhabs. of Sweden are wholly of Gothic descent. The Finns, however, are supposed to have at one time occupied the whole country, and to have been driven to the forests and fastnesses of the north by an irruption of Goths some centuries before our era. And, whatever truth there may be in this theory, it is, at all events, certain that, as no irruption of any other tribe has taken place into Sweden since the supposed Gothic invasion, the blood of the Goths must be found there in a state of comparative purity. The description of the Germans given by Tacitus might, indeed, be applied to the Swedes of the central and southern parts of the kingdom, who are a tall, robust, fine race of men, with fair complexions, light hair, and blue eyes. But to the N. of 62° or 63° lat., these characteristics begin to disappear; light hair becoming uncommon, and the complexion being frequently brown, and even tawny.

During the disastrous period from 1800 to 1810 there was a progressive diminution of the pop.; but since the accession of his present majesty, a great change for the better has taken place. The pop. which amounted to 2,544,000 in 1820, had increased to 3,109,772 in 1830, being an increase of 525,000. And the produce both of corn and potatoes having increased still more rapidly, it follows that the pop. is not only increased in amount, but, which is of more importance, has acquired a proportionally greater command over necessities and conveniences.

*Historical Notice.*—The early history of Sweden is obscure, and has little interest, at least to foreigners. The Swedes being discontented with their king, Albert of Mecklenburg, who had been raised to the throne, in 1365, Margaret, Queen of Denmark, styled the Semiramis of the North, a princess of extraordinary talent, availed herself of the opportunity to establish her authority in Sweden. In this object she was completely successful; and by the famous treaty of Kalmar, concluded in 1397, the three kingdoms of Denmark, Sweden, and Norway were united under the sway of Margaret. But the Swedes speedily became dissatisfied with this union; and the cruel and tyrannical proceedings of Christian II. excited a rebellion that terminated in the emancipation of Sweden. The famous Gustavus Vasa led the Swedes in their struggle for independence. He hoisted the standard of revolt in 1520; and having entered Stockholm in triumph, in 1523, was raised by the unanimous suffrages of his fellow citizens to the throne. Gustavus, who subsequently introduced the Protestant religion, died in 1560, in the 70th year of his age, and the 40th of his reign. "Equally great as a legislator, a warrior, and a politician, he distinguished himself in every station; whether we consider his cool intrepidity and enterprising spirit, his honest integrity, and patriotic foresight, his talents for legislation, his attachment to letters, and encouragement of learning, his affability, and his solid and enlightened piety. These great qualities, set off by a graceful and majestic person, and heightened by the most commanding eloquence, drew general esteem and admiration; and it may be justly said of him, that the most arbitrary monarch never exercised more unbounded sway over his vassals, than Gustavus possessed from the voluntary affection of his free-born subjects." (*Care*, iv. 158.)

Eric, the son and immediate successor of Gustavus, manifested symptoms of that insanity, which, unhappily, has since been exhibited on more than one occasion by the princes of the house of Vasa. Gustavus Adolphus, grandson of Gustavus Vasa, ascended the throne in 1611. Under this great prince, who was at once an enlightened ruler and the greatest general of his time, the glory and power of Sweden attained to a maximum. At the outset of his reign he was involved in hostilities with the Russians, the Poles, and the Danes, which he terminated with the most triumphant success, having acquired Ingria and Carelia from the Russians, Livonia from the Poles,

with sundry valuable territories from the Danes. These successes, and his reputation for ability and disinterestedness, naturally made him the leader of the Protestant party, in the struggle they had to wage against the power and ambition of the house of Austria. And though his glorious and successful career was prematurely terminated by his death at the battle of Lutzen, in 1632, his exertions were mainly instrumental in bringing about that freedom of religious worship, and that equal distribution of power, established by the treaty of Westphalia.

The success that had attended the arms of Sweden under Gustavus, continued to attend them under his daughter Christina, who abdicated the throne in 1654, and his other successors down to Charles XII., who became king in 1697.

This extraordinary individual, celebrated alike for his successful exploits and his reverses, well nigh consummated the ruin of Sweden. Inflexible in his resolutions, which were inspired by an ambition that was closely allied to madness, the success that attended his early campaigns made him regard every thing as possible, and precipitated him into the most extravagant projects. But the battle of Poltawa (which see) put an end to his career of conquest, reduced him to the condition of a fugitive; and gave Russia a lasting ascendancy over Sweden.\*

Charles XI. and Charles XII. enjoyed a nearly absolute authority; but the calamities entailed on the country by the folly, or rather insanity of the latter, led, on the accession of his sister Ulrica Eleonora to the crown, to the enacting of limitations, by which the royal authority was very materially circumscribed. It was, however, again enlarged in 1772.

Gustavus the III. having been assassinated in 1792, was succeeded by Gustavus IV. then a minor. As soon as this prince had been declared major he embroiled himself in hostilities with France, from which Sweden certainly had nothing to fear. He next engaged in a quixotic contest with Russia; and when the latter had overrun Finland and was threatening an attack on Stockholm, he had the unparalleled folly to reject the assistance of 10,000 English troops who had arrived at Gothenburg! Under these circumstances the dethronement of the king became indispensable to the safety of the state; and this was effected by a bloodless revolution in 1809, when his uncle, who took the title of Charles XIII., was raised to the throne, prince Christian of Holstein-

Augustenberg, being, at the same time, declared crown prince and successor. On the premature death of the latter Marshal Bernadotte, prince of Ponte Corvo, was elected successor to the crown by a Diet held at Orebro in 1810; and having accepted the honour, he soon after arrived in Sweden, of which he became king on the death of Charles XIII. in 1818.

There can be no question that the revolution which brought Marshal Bernadotte to Sweden has been of vast advantage to that kingdom. The taint of insanity in the princes of the house of Vasa, even had it been less obvious than in the cases of Charles XII. and Gustavus IV., was quite sufficient to justify a change of dynasty. And if great services, a mild, equitable, and enlightened system of government, and an unblemished private character, be any title to the esteem and affection of a people, few princes have a better claim than Charles John to the esteem and regard of their subjects. (Exclusive of the works referred to in the course of this article, we have derived much valuable information from private parties in Sweden.)

SWINEMÜNDE, a town of Prussia, in Pomerania, on the E. coast of the island of Usedom, on the middle mouth of the Oder, or rather of the lagoon, or half, which receives it previously to its falling into the sea, lat. 53° 55' N., long. 11° 15' 15" E. Pop. 3,700. It is the outpost of Stettin; all vessels destined for the latter, that draw more than 7 or 8 ft. water, being obliged to load and unload by means of lighters at Swinemünde. Formerly there were not more than 7 ft. water over the bar at the river's mouth; but it has recently been so much improved by dredging, the construction of piers, &c., that vessels drawing from 19 to 21 ft. water, come to the quays of Swinemünde, and its port is now the very best on the whole S. coast of the Baltic. In 1840 there arrived at the port 1,744 vessels of the aggregate burden of 170,348 tons, the value of the imports for the same year being estimated at 1,328,900. (See STETTIN.)

SWITZERLAND (an. *Helvetia*, including part of *Rhetia*), an inland and mountainous country of Central Europe, having Germany on the N. and E., Italy on the S., and France on the W. It lies geographically between the 46th and 48th degs. of N. lat., and the 6th and 11th of E. long. Its greatest length N. and W. is 210 m.; greatest breadth N. and S. 140 m. It is a republic formed by the union of 22 confederated states, or cantons, the area pop., &c., of which are as follows:—

Cantons.	Area in sq. m.	Pop. at end of 1857.						
		Citizens of canton.	Citizens of other cantons.	Foreigners.	Total pop.	Pop. to sq. m.	R. Catholics.	Protestants.
Zurich	685.5	217,219	7,991	6,566	231,776	338.0	about 2,000	about 225,210

*Physical Geography.*—Simond has not inaptly remarked, that "Some idea may be formed of the Helvetic geography by comparing the country to a large town, of which the valleys are the streets, and the mountains groups of contiguous houses." (*Travels in Switzerland*, i. 141.) Indeed, by far the larger portion of Switzerland consists of mountains, comprising many of the highest summits of the Alps. There is, however, a considerable extent of flat ground in the N.W., in the cantons of Friburg, Berne, and Solothurn. The general distribution of the great Alpine chains in the S. and E. parts of Switzerland has been already noticed in the article *ALPS*, in this *Dic.*, i. 67—69., and need be only briefly indicated here. Two great parallel chains, enclosing the Valais, extend between Mount Blanc, in Savoy, near the S.W. boundary of Switzerland, and Mount St. Gothard. To the most southerly of these chains, called the Pennine

Alps, belong Mount Rosa, 15,150 ft., and Mount Cervin, or the Mitterhorn, 14,836 ft. in height. (*Sauserne*.) To the N. chain, or the Bernese Alps, belong the Finsteraarhorn, 14,085 ft., the Monch, 13,497 ft., the Jungfrau, 13,717 ft. in height, &c. (*Tralles*.) E. of Mount St. Gothard, which may be considered the central point of the Swiss Alps, the Rhaetian Alps stretch through the Grisons; while on the N., other chains cover with their ramifications most part of the four Forest cantons (Lucerne, Schwytz, Unterwalden, and Uri). Among the loftiest summits of the Rhaetian Alps are the Diablung, 11,765 ft.; Muschelhorn, 10,807 ft. in height. (*Tralles*.) The Alps of the Forest cantons have several summits, as the Gallenstock, Suosthorn, &c., the height of which is but little inferior. Most of the preceding chains have a general direction from S.W. to N.E. But the direction of the main ranges throughout the rest of Switzerland is generally towards the N. or N.W., which, also, corresponds with the general slope of the country. In the W., however, beyond the lakes of Neuchâtel and Bienné, the slope of the surface is towards the N.E. The moun-

\* The life of Charles XII., by Voltaire, is one of the most interesting pieces of biography ever published. See also the admirable character of Charles XII., by Dr. Johnson, *Vanity of Human Wishes*, v. 147.

tain-system of this part of Switzerland is that of the Jura (see *anlé*, 95.); a system composed of several parallel ranges of mountains, including very long and narrow valleys, but nowhere rising to 6,000 ft. in height. (*Bruguière, Orographie de l'Europe; Picot, Etel, &c.*)

The great rivers Rhine, Rhodé, Inn, Ticino, and Doubs (see the names), have their sources in Switzerland; after which, the chief river is the Aar. The Aar (see the article) rises at the foot of the Finsteraarhorn, and runs at first E., but afterwards N.W. through the lakes of Brienz and Thun, to about 9 m. N.W. Berne, when it turns N.E., and finally falls into the Rhine, near Klingenberg, after a course of about 175 m. This river, which drains by far the greater part of Switzerland, receives on the right the Emmen, Wigger, Sur, Reuss, Limmat, &c.; and on the left, the Simmen, Saane, and Thiele. Unterseen, Thun, Berne, Solothurn, and Aarau are on its banks. The Thur and Birs, tributaries of the Rhine, are the only other streams that deserve notice.

Switzerland has a greater number of lakes than any other tract of country of equal extent in Europe, excepting, perhaps, the grand duchy of Finland. All these lakes are navigable, and remarkable for the depth and purity of their waters, and their great variety of fish. The following is a

STATEMENT showing the probable Area, Height of Surface above the Sea Level, and greatest ascertained Depth of the principal Swiss Lakes.

Lakes.	Area in sq. m.	Height above Sea.	Greatest Depth.
		<i>Ft.</i>	<i>Ft.</i>

Sempach	-	1,718	500

The lakes Maggiore and Lugano are partly, also, in Switzerland. A notice of most of these lakes will be found in this work under their several heads, or those of the different cantons in which they are situated.

Switzerland is almost wholly composed of primary and sedimentary rocks: volcanic formations are rare. The geological constitution of the mountain chains has been already noticed. (ALPS, JURA, &c.) The central portion of the Alps consists of granite, gneiss, porphyry, and other primary rocks, inclosed successively by transition and secondary formations: the Jura is wholly of a remarkable limestone formation. But the region between the Alps and the Jura is occupied with a peculiar formation of green sandstone, called *molasse*, or *na-gelflake*, alternating occasionally with limestone and grauwacké, which extends throughout all the lower parts of Switzerland into S. Germany. This deposit has been classed with those of a tertiary kind, and Brogniart and other geologists suspected it to be of a date posterior to the formation of the Paris basin. For particulars respecting the complicated geology of Switzerland, the reader may consult the works of Saussure, Humboldt, Bronghart, Lyell, &c.

The mineral riches of the mountains are but little known or explored; a few iron mines in the Jura being the only ones that deserve notice. There are numerous mineral springs, many of which are resorted to medicinally; and those at Box, and others in the canton of Basle, furnish considerable quantities of salt. A few insignificant coal beds have been met with; but the remaining mineral products of any value are mostly confined to slate, marble, gypsum, granite, and other kinds of building stone.

The climate is not only dependent on elevation, but on the influence exercised by the glaciers in cooling the atmosphere, the openings and exposure of the valleys, &c. But, on the whole, Switzerland is a much colder country than its lat. and situation in Europe would appear to warrant. At Berne, the mean annual temp. is about 45° Fah.; at Basle, 46°; and at Geneva (1,290 ft. above the sea), 46½° Fah. The climate in the Alpine regions is believed by some to have become colder in recent times; since the line of perpetual snow (which here varies from about 9,300 to 9,600 ft. above the sea) has certainly descended lower, as compared with a former period; the glaciers have increased in number; and many tracts are now bare, which were formerly covered with forests and pasture grounds.

The vegetable products of nearly all the different zones of continental Europe are found in Switzerland. The Valais, which has the widest range of vegetation among the Swiss cantons, produces, without culture, nearly 2,000 species of plants, exclusive of 1,000 *cryptogamia*. In

respect of its vegetable products, the country may be classed into 7 distinct regions or zones, according to its elevation, as follows:—

Regions.	Productions.
Lower Region - — to 2,100	Limit of the vine. In lower parts of Tessin and Valais, the fig, pomegranate, &c.
Forest do. - 2,100 - 3,500	Limit of the elm. Buckwheat and maize to 2,500 ft. Chestnut ceases at 3,000 ft.
Beech do. - 3,500 - 5,500	Flax, hemp, and barley flourish at 4,000 ft., about which Italian poplar, ash, and wild cherry cease.
Pine and fir do. 5,500 - 6,800	Neither potatoes, apples, or pears grow.
Lower Alpine do. 6,800 - 8,500	Limit of trees of every kind. Includes some good pasture land.
Upper do. - 8,500 - snow line	Only shrubs and Alpine plants.
Snow region, above line of perpetual snow.	<i>Saxifraga oppositifolia</i> , gentians, <i>chrysanthemums</i> , &c.

There are, no doubt, various exceptions to this table, consequent on difference of lat., position, &c.; but it may be considered as applying to the country generally. (*Wahlenberg, De Veget. in Helv.; Koshlöff, Voyages, &c.; Note in Foreign Quarterly Review*, 1, 210—213.)

Among the wild animals of Switzerland are the bear, wolf, lynx, wild boar, chamois, ibex, deer, and game of all kinds, the marmot, marmoset, &c. The chamois is becoming scarce. The remarkable variety of the sparrow, so useful, and the breed of which is preserved with such care at the hospice of St. Bernard, is of Spanish descent, and frequently attains the height of 2 ft. and the length of 6 ft. The birds of prey comprise numerous species of eagles and vultures, one of which latter, the *laucrocyon* (dumb-streeter), is said to be the largest active bird of Europe. Salmon, trout, carp, &c. inhabit the lakes. There is only one venomous serpent, the *Crotalus berus*; but the insect tribes are more numerous than we might be led to suppose from the rugged and elevated nature of the country.

*Property, Agriculture, &c.*—Switzerland is a country of small proprietors. An estate of 150 or 200 acres, belonging to an individual, worth perhaps from 900, to 1000 a year, would be considered large every where, except in the canton of Tessin, or the Emmenthal, in Berne, and a few other districts, where local customs exist to prevent the too great division of property. Except in certain of these districts, the property of individuals is at their death divided in equal shares among their children, without respect to sex or seniority. In certain cantons, however, as Glarus, landed property cannot be left to any one not a direct descendant, and, failing such heirs, it becomes the property of the government. Indeed, several of the cantons and governments, as that of Berne, and the greater number of the towns, possess a very great extent of landed property. But this is generally apportioned in small lots to the different parties having right to it, or is depastured in common. Switzerland, in fact, is almost wholly a pastoral country; little corn is produced, and the crops are scanty and precarious. Cattle, sheep, and goats constitute the chief riches and dependence of the inhabs. There are, generally speaking, no farmers; each proprietor farming his own small portion of land, and the mountainous tracts belonging to the different communities being, as already stated, depastured in common. No foreigners can become possessors of land, nor can native Jews in several of the cantons.

Switzerland has been estimated to comprise 2,250,000 *morgen* arable land, 900,000 do. land in artificial pastures, 120,000 do. vineyards, and 2,400,000 do. forests. (*Neigebaur's Schutz, Allg. Erdkunde*, xxi. 51.) It is only in the canton of Thurgau that corn is produced in any considerable quantity, and even there the home growth does not exceed two thirds the required supply. In Uri no corn is raised; and in certain parts of the Berne Oberland wheat is treated as an exotic, and trained carefully over twigs! Rye, oats, and barley are principally cultivated; maize, however, is grown in some parts in considerable quantities. Beans, lentils, potatoes, turnips, pumpkins, flax, hemp, woad, madder, poppies, and tobacco are also grown, but to an insignificant extent. Vines flourish in several of the cantons; as on the shores of the lake of Geneva, Vaud, the Valais, Neuchâtel, Aargau, &c. The canton of Neuchâtel has been estimated to produce, on an average, about 700,000 galls, 400,000 of which, at least, are sold in the neighbouring cantons. The manufacture of sparkling wine, in imitation of champagne, has of late years been on the increase in Neuchâtel, and from 120,000 to 140,000 bottles are now annually exported. Along the banks of the Lake of Constance, and in the cantons on the Rhine, apple, pear, and cherry orchards are numerous; and elder, perry, kirschwasser, &c. are made in large quantities.

"Vineyard husbandry," says Mr. Laing, "is altogether

a garden cultivation, in which manual labour, unassisted by animal power, scarcely even by the simplest mechanical contrivance, does every operation; and this gives the character to *all* their husbandry: hand labour is applied to all crops, such as potatoes, Indian corn, and even common grain crops, more extensively, both in digging and clearing the land, than with us. It is not uncommon to find agricultural villages without a horse; and all cultivation done by the hand, especially where the main article of husbandry is either dairy produce or that of the vineyard." (*Notes of a Traveller*, p. 355.)

Cows, goats, and sheep, as already stated, constitute the principal wealth of the Swiss, the inhabitants of the manufacturing towns excepted; or, to discriminate more accurately, the goats, in a great measure, support the poorer class, while the cows supply the cheese, from which the richer derive their limited wealth. The Swiss peasant is extremely fond of his cow; and to pass the winter without a cow to care for would be to him extremely irksome. The cantons of Glarus, the Grisons, Appenzell, Berne, Tessin, and the Valais, are those most distinguished for the extent and excellence of their pastures. With little exception, all the land not covered with forests, in the cantons of Schwytz and Uri, is used for the pasturage of cattle. The Alpine pastures are estimated, not by their extent, but by the number of cows they will maintain: in the lower Alps about 3 acres, and in the upper from 10 to 15 acres, being the usual average allowed to each. In several of the N. cantons, these pastures are mostly private property; in the E. they commonly belong to the canton, being apportioned among the different parishes, each having its *alp*, or common pasture for its cows. Each inhabitant is entitled to a share of this pasture from June to October. Few individuals, however, have such a number of cows as would repay the labour of attending them in summer on the mountains, properties being in general so small as rarely to be able to maintain above five or six cows in winter, and usually, indeed, not more than half that number. The practice, therefore, is for parishes to hire herdsmen and assistants to take care of the cows in summer when on the mountains, and to make the cheese. The owners of the cows get credit daily for the quantity of milk furnished by their cows; and the produce of the sale of cheese at the end of the season, the expenses being deducted, is divided amongst them in proportion to the total quantity of milk furnished by each. (*Lange's Notes of a Traveller*, 351.) When let, the mountain pastures are rented from the middle of May to the middle of Sept., the cattle being kept in the lowlands during the remaining eight months of the year. The term of the lease on which they are let rarely exceeds a summer. Six or eight goats, or about four calves, sheep, or hogs, are deemed, as to feeding, equivalent to a cow; but a horse is reckoned equal to five or six cows, because he roots up the grass. The Swiss cows are very handsome animals, and so valuable that, even in Switzerland, they fetch about 20*l.* each. They yield more milk than those of Lombardy, where they are in great demand. In some parts of Switzerland, with 40 cows, a cheese of 45 lbs. may be made daily; and in the vicinity of Althorff, they make, in the course of 100 days, from the 20th of June, two cheeses daily of 25 lbs. each, from the milk of 18 cows. Cheese appears to have been an important article of export from Switzerland from a remote period. Many varieties are made; the most celebrated of which are those of Schabziger (see GLARUS) and of Neuchâtel and Gruyère (which see). About 30,000 cwt. Gruyère cheese is said to be annually exported; and from the middle of July to Oct., about 300 horses are employed in transporting Swiss cheeses over Mount Grisi.

The total number of cattle in Switzerland has been vaguely estimated at 800,000, of which 500,000 are cows. (*Schulz*.) They are principally of two distinct breeds: one of large size, with branching horns, mostly inhabiting the lower parts of the country; and another called the *Oberlander*, a small and inferior species, confined chiefly to the Alps. The best cattle are those of the Simmenthal, the district of Saanen, and the cantons of Friburg and Solothurn; the last being especially remarkable for the excellence of its oxen. Cows, as well as oxen, are employed for the plough. The horses, though not handsome, are strong and spirited, and well adapted for cavalry and artillery service, for which they are exported to France and elsewhere. Asses and mules are bred in the S. cantons, where they are mostly used for the conveyance of passengers and merchandise. The stock of sheep is estimated at half a million, and of goats at about the same number. There are two varieties of sheep, one native covered with a coarse white wool; and the other a Flemish breed, with fine wool of a dun and yellowish colour. But sheep are not a favourite stock, and it is only in a few places that the improvement of their fleeces, by crossing with merinos, has been at all attended to. Hogs are of a large but coarse breed, and are principally kept in the Forest cantons.

The urgent necessity of collecting fodder for the sup-

port of the cattle during winter makes the collection of grass for hay a work of paramount importance. Hence, wherever it is found it is carefully collected; and the peasants, having *crampons* on their shoes, to prevent them slipping, gather hay in places inaccessible to cattle! Grass, not three inches high, is sometimes cut three times a year; and in the valleys, the fields are shaven as close as a bowling-green, and all the inequalities clipped as with a pair of scissors. In Switzerland, as in Norway, the art of mowing seems to be carried to its highest perfection, and no where is so much skill and attention displayed in harvesting corn and hay. But arable and meadow cultivation are both in a backward state, owing principally to the pertinacity with which the people reject innovations, and cling to old and defective methods of husbandry. On arable lands fallows take place every 4th or 5th year, and the culture of turnips for cattle feeding is unknown. Great attention is, however, paid to the collection of both solid and liquid manure, but they are said not to be very judiciously employed; and the neglect of irrigation, which might almost every where be easily effected, and the rudeness of agricultural implements, especially ploughs, are obvious. (*Kasthofer, Voyage dans les Petits Cantons et dans les Alpes Rhétiques*.)

The wages of agricultural labour are low; but on the whole, the rural pop. may be considered well off. Mr. Symonds says, that "it would require 30*l.* a week in England, in the neighbourhood of any country town, to pay a man, his wife, and 3 children (2 of whom shall be above 15 years of age), in the same condition, and in all physical respects, on a footing with the average of Swiss artisan peasants having the same family." (*Rep. on Swiss Handloom Weavers*.) We incline, however, to think that this is a very exaggerated statement; and from all that we can learn, the agricultural labourers in most parts of England and Scotland have no reason to envy the condition of those of Switzerland. The diet of the Swiss consists more of porridge than is general in England, and much more milk and cheese is consumed. In other respects, wine and cider being substituted for beer, the catalogue of articles of food is much the same among the peasantry in both countries. The houses inhabited by the rural pop. are mostly of wood, but capacious, and furnished generally with all the articles required for daily use. The herdsmen who tend the cattle in the Alpine pastures are lodged in *chabets*, or rude log huts formed of the trunks of pines, and having rarely any furniture, except the necessary dairy utensils.

Chamois hunting, fishing in the lakes, and boat building, employ some of the inhabs. in the intervals of agricultural industry, but to no great extent. A great number of Swiss emigrate to foreign countries, where they act as valets, and embark in various trades, especially those of confectioners and bakers; always returning, however, to spend or invest their gains in their native land. The Swiss have also been for centuries the *condottieri* of Europe; and have always been ready to barter their blood and bravery, or to enter into the military service of any sovereign or republic that chose to hire their services, and to support any cause, however unprincipled or unjust! There were formerly numerous Swiss regiments in the service of France and Spain; and they are still extensively employed by the king of Naples, the Pope, and the king of Sardinia. A Swiss, in fact, will do any thing for money, and nothing without it. Hence the proverb, *point d'argent, point de Suisse*. The foreign mercenaries are extremely economical; and such of them as survive return home with all that they have been able to amass.

*Manufactures.*—Notwithstanding the geographical disadvantages of Switzerland, the inhabs. have carried some branches of manufacturing industry to a considerable state of advancement. Various parts of the country have indeed, been noted since the 13th century for their manufactures; and despite the competition of this and other countries, they are now more extensively carried on than ever. It is impossible, however, from their being almost wholly domestic, to estimate the number of persons employed, or the annual value of the produce of any of the Swiss manufactures. Most part of the agricultural inhab. are almost wholly occupied during winter at the loom, or in other branches of manufacturing industry; and they also engage in them during the evenings throughout the year, and when their little patch of land does not require their attention. In the districts devoted to hand-loom labour from 1 to 4 looms are usually to be found in a cottage; the weavers being furnished with the warp, wool, &c., by the manufacturers, to whom they return the woven goods. A line drawn through Switzerland in a N.N.E. direction, across the canton of Friburg, and through the Saanen, pretty accurately divides the German from the French pop., each portion of which presents in its manufactures some distinguishing characteristic of its origin. In the French cantons the manufacture of watches, musical boxes, Jewellery, &c., are most extensively carried on; while

cotton and silk fabrics are the principal employment of the inhabs. of the E. and N.E. cantons. In the Grisons, and the Italian cantons S. of the Swiss Alps, there are few, if any, manufactures. The principal manufacturing cantons of German Switzerland are Appenzell (outer Rhodes), St. Gall, Thurgau, Zurich, Aargau, and Basle; and in the French part of the country those of Geneva and Neuchâtel. Appenzell and St. Gall are the principal seats of the cotton trade, which Mr. Symons has roughly estimated to employ between 600,000 and 700,000 spindles. Raw cotton is imported from England, France, Holland, and Trieste; cotton twist of the higher numbers being almost wholly brought from England. Cotton printing is conducted to some extent in Neuchâtel, where the quality of the water, and perhaps other physical circumstances, conspire to produce brilliant and beautiful colours, in which, indeed, consists the whole excellence of the Swiss goods. The silk manufacture is mostly conducted in Zurich and Basle. The raw silk is drawn from various foreign states, but chiefly from Lombardy, from which country also four fifths of the organzine are brought. The watch-making trade in Geneva and Neuchâtel is of very great importance. (See the articles.) France furnishes to Switzerland about 50,000 movements (*ébauches*) annually, and receives all her fine works and watches from the Swiss manufacturers. The watch-making business in France is in reality of no great importance, most of the artisans being employed in what is called the *répasse* of the works originally produced in Switzerland. (*Bourving's Rep.*, p. 12.) Nearly 120,000 watches are made annually in the elevated regions of Neuchâtel, and many more, besides jewellery, in the canton of Geneva, a large portion being smuggled into France. Linen fabrics, damasks, &c., rivaling those of Belgium, are made in Berne, in which canton, however, there are few manufactures of consequence except those of linen. In addition to the above, woolen cloths, paper, leather, straw plait, iron goods, &c., are made in various places, but many of these have declined in favour of those above specified.

It is easy to see that the foundation of Swiss manufactures is laid in the peculiar distribution of property in the country, and the necessities of the inhabs. Most families have a small patch of land; but as its cultivation does not occupy half their time, and is besides unable to afford them more than a scanty supply of the most indispensable necessities, they naturally endeavour to eke out their limited means by engaging in weaving and such like employments. And inasmuch as all they make in these employments is so much clear gain, so much added to the fund on which they must otherwise subsist, it is plain they can afford to work at the lowest possible rate of wages; and, in point of fact, their eulogists, Symons and Bourving, admit that their wages are reduced to the smallest pittance.

The Swiss, from their situation in the centre of Europe, are obliged to pay an enhanced price for their cotton and yarn; so that their whole advantage consists in their being able to reduce wages to next to nothing without being driven from the business. We believe, however, that even this resource will not be found to afford them adequate protection; and that they will be compelled, by the competition of the power-looms of this and other more favourably situated countries, to relinquish all but the finer and more difficult sorts of weaving.

The influence of the circumstances now alluded to has been increased by the wise and liberal policy followed by the government. Switzerland is a country in which the great principles of free labour at home, and free intercourse with foreigners, have been fully carried into practice. No restrictions exist upon the pursuit of any branch of trade. "Industry has been left to itself. Wealth has not been diverted, by legislative interference, from its own natural tendencies. There has been no foolish struggle encouraged by the government between the protected monopoly of the few, and the unprotected interests of the many. Two millions of men have made, under every disadvantage, the experiment of free trade as a system. The consumer has been allowed to go to the cheapest market, the producer to the dearest; and activity is every where visible alike in the trading and agricultural districts. One element only is wanting to make Switzerland the most prosperous of manufacturing nations. Capital is rapidly increasing, by the action of unrestricted, unfettered, unprotected industry." (*Bourving's Rep.*, 3-4.) The general prosperity is also favoured by other extraneous circumstances: land is, for the most part, released from tithes and taxes, and the people subjected to very trifling fiscal burthens. In many of the cantons there is no national debt; and some of them, indeed, nearly discharge the expenses of their government out of the interest of the capital accumulated from the surplus revenues of previous years. The establishment of the 'Prussian Customs' Union occasioned at first serious apprehensions among the Swiss; and some of the N. cantons, as Schaffhausen and Thurgau, were anxious to join

it. But a commission, appointed by the Confederation in 1833, decided that such a step was altogether unadvisable; and there seems to be no great probability that Switzerland will join the League.

Several of the cantons derive a considerable portion of their revenues from a *droit de péage*, or duty, generally less than 1*d.* cwt., on goods at the turnpikes on the various cantonal frontiers. A federal duty of from 1 to 2 *batzen* per cwt. is paid at the frontier of the republic on goods imported from foreign countries; but goods exported from Switzerland pay no duties, and from the absence of *ad valorem* duties no estimate can be made of the value either of the imports or exports of the Confederation. (See GENEVA.) Silk, cotton goods, lace, watches and jewellery, straw plait, cattle and cheese, wine from Vaud and Neuchâtel, liquours, herbs, &c., constitute the chief articles of export. In 1834, according to the French accounts, the value of the wine, oil, madder, brandy, salt, fruits, colonial produce, silk, woolen, and cotton manufactures, &c., exported from France to Switzerland, amounted to nearly 30,000,000 fr.; for which Switzerland sent back horned cattle, clothed ribbands, linens, thread, and other produce, to the amount of 12,700,000 fr., the balance being, no doubt, liquidated by the clandestine exportation of watches, jewellery, &c. Wheat is brought principally from South Germany; salt (about 500,000 cwt. a year), leather, hemp, flax, chicory, tobacco, and oils, come principally from Germany, but partly from France; raw cotton, cotton twist, cotton cloths for printing, hardware, iron and other metals, fancy wares, colonial produce, drugs, dyes, &c. from England, and partly also from the Netherlands; woolen stuffs from Belgium, Swabia, and Saxony; silk from Piedmont and Lombardy, &c. Switzerland enjoys a large share of the transit trade between Germany and Italy, Austria, and France. The principal lines are from the Lake of Constance across the country to Geneva; from Schaffhausen and Basle to Geneva; but especially from Basle, through Lucerne, Mt. St. Gothard, to Milan, Genoa, &c. Another line passes from Basle to Zurich, through the Grisons, and across the Spulgen, to Lombardy and Trieste. The roads, which are maintained by the cantonal governments, are every where, almost, in good order; but from the rugged nature of the country, carriage is costly as compared with that in the neighbouring states. The carriage of a ton weight of goods over a distance of 30 in. frequently costs 2*s.*

Hardly a country in Europe has so complicated a currency, or set of weights and measures, as Switzerland, nearly each canton having its own, which differs more or less from the rest. The Swiss franc of 10 *batzen* = 1*d.* French fr., and nearly 1*d.* 3*d.* Engl. German money is, however, common in the E. and N., and the coinage of Milan in the S., while French money is almost universally met with.

**Government.**—The 22 cantons are united on equal terms in a confederation for mutual defence; but in most other respects each has its own independent internal administration. The government is wholly republican in every canton, except Neuchâtel, in which the king of Prussia exercises the right of sovereignty. Before 1831, when important reforms took place in the Swiss constitutions, the cantons were divided into aristocratic and democratic; but at present the government is more or less democratic in all. In Uri, Schwytz, Unterwalden, Glarus, Zug, and Appenzell, the functions of legislation and sovereignty are vested in the *lands gemende*, or general assembly of the inhabs., in which every citizen of full age, without any property qualification, has a vote. In the other cantons the legislative power is delegated to the *landrath*, or council of representatives, elected in the primitive or general assembly of the inhabs., the elective suffrage in which is universal, or nearly so. And in some of these cantons, as St. Gall and Basle (country), the primitive assemblies have a  *veto* on the decisions of their grand council in all matters of an organic character: while in others the people at large have the right to revise their constitution in primitive assembly after a certain number of years. The grand council, where it exists, elects the petty council, or executive power, and at the head of which is the burgo-master or *avoyer* of the canton; in other cantons the *landammann*, or *landshauptmann*, is chosen by the general assembly. The General Diet of Switzerland is composed of deputies from all the cantons, from two to three being sent by each, though each canton has but one vote. The deputies vote according to the instructions received by them from their several governments. The Diet declares war, concludes peace, contracts foreign alliances, nominates its diplomatic representatives, determines the amount of military force, and governs the expenditure of the finances of the Confederation. It meets annually in the chief town of the directorial canton, on the first Monday of July, or at any other time, on the demand of any five of the cantons, being presided over by the burgo-master of the canton in which it meets. Its place of meeting is Berne, Zurich, and Lucerne, every two years alternately. While not

sitting, its powers are confided to the *vorort* (grand council of the directorial canton for the time being), to which, in case of matters of importance pending, the cantons add six additional members. In the case of sudden danger from within or without, the canton affected has the right to demand assistance from any adjacent canton, but must also give immediate notice to the *Vorort*, which convokes the Diet, and the latter determines whether the expenses of such assistance shall fall upon the canton requiring it, or upon the general body. A federal chancery, composed of a chancellor and a secretary of state, is established in the Directorial canton by the Diet. The revenue of the Confederation consists chiefly of a money contingent of about 540,000 Swiss fr., contributed by the different cantons proportionally to their military contingent, and of the tolls on imports collected by the frontier cantons, and accounted for by them to the Diet. The money-contingent of the different cantons varies from 5 to 12 Swiss fr. for every man of their military contingent. The number of men each canton furnishes to the federal army varies according to its amount of pop. and resources. The total armed force of the Confederation, according to the scale adopted in 1840, amounts to 64,000 men, viz. 51,800 infantry, 3,800 artillery, 3,700 cavalry, and 700 engineers. Switzerland has, however, no standing army in the strict sense of the word. It is only a militia force, in which every male Swiss must serve for a certain number of years, holding himself at all times ready if called on for cantonal or federal service. Every two years a federal camp is formed for exercise; and at Thun, in the canton of Berne, a school for the instruction of officers is held for two months each year.

The judicial power of the Confederacy is very limited: the Diet cannot in any way act as a court of justice, even for the purpose of mediating differences between the several cantons, the decision of which is always referred to special arbitration. If the arbitrators cannot agree, the Diet may indeed appoint an umpire; but from his decision no appeal lies to the Diet. Judicial tribunals, independent of the executive, are established in all the cantons. They are of three grades, and vested equally with civil and criminal jurisdiction. In cases of rebellion, a federal tribunal may be established by the Diet, though the offenders may also be tried by their respective cantonal courts. Each canton has its own code of laws, which are, in general, similar to those prevalent in Germany. In some cantons, as Friburg, Schwytz, &c., the Carolina, or penal code of Charles V., is in force, or was in 1836; but in the interval some new arrangements have been made. Down to that period trials were not public, and juries did not exist. The prisons in most parts of the country are in a bad state; but in Berne, and especially in the French cantons, improved and benevolent systems of discipline have been adopted, and at Geneva the panoptic penitentiary system of Bentham has been introduced.

*Religion.*— Besides the Catholic and Protestant pop., the respective numbers of which are given in the table at the beginning of this article, there are about 600 Anabaptists, and 1,800 Jews. The latter enjoy no political rights. Many very bigoted provisions are in force with respect to religion in the R. Cath. cantons. In Basle city, indeed, the Protestants retaliate, no Catholic being able to acquire in it the right of citizenship. But in Valais it is peremptory that all the children shall be brought up in the Catholic faith; and in Uri, Schwytz, and Unterwalden, any native who should marry a Protestant would be deprived of all the rights of citizenship, and banished the canton! In general, according to the religious compact of Aarau, no Protestant minister is permitted to preach in a Catholic canton, and *vice versa*; though in parishes in which only one church exists, in Glaris, St. Gall, and other cantons, that edifice is used at different times by both Protestants and Catholics. The Catholics are much more numerous than the Protestant clergy, comprising altogether about 6,000 individuals (regular and secular), the incomes of many of whom are very considerable. There are four Rom. Cath. dioceses: Chur and St. Gall, Basle\*, Lausanne, and Sion; the bishops of which are suffragans of the archbishop of Milan. Tessin is in the diocese of the bishop of Como. The government of the Protestant church is considered a branch of the department of public instruction, and as such belongs to the magistrates in the various cantons.

The Swiss Protestant church, as every body knows, was originally Calvinistic in principle, and is Presbyterian in its form. But the zeal by which the Swiss Protestants were formerly distinguished appears, if we may depend on the statements of Mr. Laing and others, to have wholly evaporated; and it is a singular and not easily explained fact, that, in the Protestant cantons, religion is, at present, less cared for, and has less influence, than any where else in Europe. The people are not infidels; but are

wholly indifferent to, and, in fact, careless about religion! Mr. Laing has endeavoured, though not, as we think, with any great success, to account for this apathy to religious truths on the part of the Swiss. (*Notes of a Traveller.*) No doubt it is the result of a variety of causes; and is principally, perhaps, to be ascribed to something defective in the system under which the clergy are appointed, and in their training. It is right, however, to state that, notwithstanding the neglect of religion, the Swiss Protestants are eminently moral in their habits; and, though mercenary, are honest and upright in their dealings.

Public education is very widely diffused in the cantons of Zurich and Aargau; for, if we may rely on a Parl. Rep. of 1837, the pupils in their public schools in 1832 were to their whole pop. as 1 to 5. In Vaud and Neuchâtel the proportion was about as 1 to 6; and in Switzerland at large, in 1834, as 1 to 9; being consequently, in respect of the attendance at school, before Great Britain, the Austrian empire, Belgium, and France. Parents must give their children some sort of education, from the age of 5 to that of 8 years; or their neglect may be punished by fine, and, in some cases, even by imprisonment. (See *Synon's Rep.*, &c.) The obstinate refusal of parents to send their children to school is, however, a rare case; because no child becomes able to exercise the rights of citizenship, or is taken into service of any kind, without having first received the sacrament, which is administered to those only who have attained a certain degree of instruction. In every district there are primary schools, in which the elements of education, geography, history, singing, &c., are taught; and secondary schools for youths of from 12 to 15, in which instruction is given in ancient and modern languages, geometry, natural history, the fine arts, music, calligraphy, &c. In both these schools the rich and the poor are educated together, the latter being admitted gratuitously. There are normal schools in several of the cantons for the instruction of schoolmasters; who are subsequently paid, by the cantons, salaries varying usually from 10*l.* to 50*l.* a year. Sunday-schools exist in several cantons, and Lancasterian schools in Geneva and Vaud. (*Journal of Education*, vol. iii.) There are superior gymnasia in all the chief towns. Basle has a university, which was formerly much frequented; and since 1832 universities have been established in Berne and Zurich. The ordinary expenses of a student at Berne, including living, &c., may, perhaps, be covered by from 600 to 800 Swiss fr. a year: the expense at Zurich is rather less. In the principal towns there are good libraries, and literary associations; and between 20 and 30 newspapers, besides magazines, &c., are published in Switzerland, some of which are above mediocrity, though the former are said to be sadly deficient and incorrect in their foreign news and general politics.

Every parish or commune is obliged to support its own poor, who become chargeable on their own commune. But only those having the rights of citizenship have a right to eleemosynary support: the privilege not being extended to others, though born in the commune. In most instances, the communes have poor-funds administered independently of the cantonal government; but if these are not found sufficient, a poor-rate is levied. This rate is always limited; being, in Zurich, no more than about  $\frac{1}{2}$ d. a year from each individual. The number of poor appears to be on the decrease; and it is only in Uri, Tessin, Valais, and one or two other cantons, that pauperism is at all common.

The peculiar feature in the condition of the Swiss pop., the great charm of Switzerland, next to its natural scenery, is the air of well-being, the neatness, the sense of property imprinted on the people, their dwellings, their plots of land. They have a kind of Robinson Crusoe industry about their houses and little properties; they are perpetually building, repairing, altering, or improving their dwellings, and their tenements. The spirit of the proprietor is not to be mistaken in all that one sees in Switzerland. Some cottages, for instance, are adorned with long texts from Scripture painted on or burnt into the wood in front over the door; others, especially in the Simmenthal and Haslethal, with the pedigree of the builder and owner. These show, sometimes, that the property has been held for 200 years by the same family. The modern taste of the proprietor shows itself in new windows, or additions to the old original picturesque dwelling, which, with its immense projecting roof, sheltering or shading all these successive little additions, looks like a hen sitting with a brood of chickens under her wings.

"None of the women are exempt from field-work, not even in the families of very substantial peasant proprietors, whose houses are furnished as well as any country houses with us. All work as regularly as the poorest male individual. The land, however, being their own, they have a choice of work, and the hard work is generally done by the men. The tilling and bringing home wood for fuel; the mowing grass generally, but not al-

\* The titular bishop of Basle resides at Solothurn, and of Lausanne at Friburg.

ways; the carrying out manure on their back; the handling horses and cows, digging, and such heavy labour, is man's work; the binding the vine to the pole with a straw, which is done three times in the course of its growth; the making the hay, the pruning the vine, twitching off the superfluous leaves and tendrils, — these lighter, yet necessary jobs to be done about vineyards or orchards, form the women's work. But females, both in France and Switzerland, appear to have a far more important rôle in the family, among the lower and middle classes, than with us. The female, although not exempt from out-door work, and even hard work, undertakes the thinking and managing department in the family affairs, and the husband is but the executive officer. The female is, in fact, very remarkably superior in manners, habits, tact, and intelligence to the husband, in almost every family of the middle or lower classes in Switzerland. One is surprised to see the wife of such good, even genteel, manners and sound sense, and altogether such a superior person to her station, and the husband very often a mere lout. The hen is the better bird all over Switzerland." (*Laing's Notes*, p. 336.)

If we divide the people of Switzerland according to their language, nearly 1,500,000 speak a German dialect, 450,000 French, and about 125,000 a corrupt Italian: in a large part of the Grisons, the Romansch tongue, bearing a very close analogy to the ancient Latin, is spoken in several dialects. The distinctions of language are the principal among the Swiss: there are few physical differences in the inhabs. of the different parts of the country, except that the natives of the mountainous parts are the more muscular and active. The Swiss are unquestionably a brave people, devoted to their home and their freedom, for the maintenance of which they have often made great sacrifices and exertions. The situation, hence, the necessity of husbanding their resources, and the difficulty of increasing them, have made them sober, industrious, and economical; but also, we must say, mean and mercenary. There is nothing they will not undertake, how degrading soever, provided they think they can make money by it. To attain the rank of valet in the family of some foreign nobleman seems the summit of their ambition. Though attached to liberty themselves, 2s. 6d. or 3s. a day will make them flock to the banners of its most inveterate enemies. In this respect, indeed, they have no predilections, and the Emperor of Russia and the President of the United States may equally command their services.

"Man and steel, the soldier and his sword,"

continue to be the most marketable of Swiss products. Though attached to their country, they have no relish for its magnificent natural beauties; and though an honest, laborious, prudent, and, on the whole, respectable people, they have little that is amiable or attractive in their character.

After the conquest of Helvetia by Julius Cæsar, the Romans founded in it several flourishing cities, as Aventicum, &c., which were afterwards destroyed by the barbarians. On the decline of the Roman empire, it successively formed a part of the kingdom of Burgundy and the dominions of the Merovingian and Carolingian kings; while the E. part of Switzerland became first subject to the Allemanni, and subsequently it was wholly included in the German Empire under Conrad II. in 1037.

The house of Hapsburg had, from an early period, the supremacy over all the E. part of Switzerland; and it preserved its ascendancy till about 1307, when Uri, Schwytz, and Unterwalden, entered into a confederacy for mutual aid against Austria, which compact was confirmed after the defeat of Leopold Duke of Austria, at the battle of Morgarten, in 1315. From 1332 to 1353, Lucerne, Zurich, Glarus, Zug, and Berne, joined the Confederation. Aargau was conquered from Austria in 1415; the abbey and town of St. Gall joined the other cantons in 1451–54; Thurgau was taken in 1460; Friburg and Solothurn admitted in 1481; the Grisons in 1497; Basle and Schaffhausen in 1501, and Appenzel in 1513. About this time Tessin was conquered from the Milanese; and Vaud was taken from Savoy, by the Bernese, in 1460. The remaining cantons were not finally united to the Confederation till the time of Napoleon; and the present compact, by which all are placed on a perfect equality, only dates from the peace of 1814.

The principal authorities consulted for this article have been *Pictet, Statistique de la Suisse*; *Ebel, Manuel du Voyageur*, &c.; *Simon, Voyage en Suisse*; *Hoffman; Inglis's Switzerland*; *Dict. Geog.*; *Bouring and Symonds's Reports*, &c., *passim*.

SYDNEY, a town of E. Australia, the cap. of the British colony of New South Wales, on a cove on the S. side of the magnificent bay, or inlet of the sea, called Port Jackson, about 7 m. from its mouth; lat. 33° 55' S., long. 150° 10' E. Pop., in 1811, about 30,000. We

subjoin the following details respecting the census of that year:

The town stands principally on two hilly necks of land, bounding Sydney Cove on the E. and W., and on the intervening flat ground for nearly 2 m. inland, and would appear from the extent it covers, to contain a much larger pop. than really belongs to it; but the houses in many parts are not more than one story in height, and are generally surrounded by gardens. In the older part of Sydney, termed 'the Rocks,' the streets are comparatively irregular, for, owing to a want of attention at first, they were laid out, and the houses built, according to the views of individuals, without any fixed or regular plan. But latterly this defect has been to a considerable degree remedied in the old streets; and the new ones are systematically laid out. On the left side of the cove many handsome houses rise in successive terraces. The E. peninsula is almost wholly occupied by the government domain, a circumstance which is rather to be regretted, since the water, being deeper there than on the W. side of the cove, it is better adapted for the erection of warehouses, &c. It has been proposed, however, to construct a public wharf along the E. side of the cove. The government house is an edifice, built, at different periods, by successive governors, and having in front a fine plantation of English oaks and Cape pines, the walk round which forms the favourite promenade of the citizens. The other chief public buildings are the great barracks, occupying one side of the principal square; the convict hospital, a large stone building with verandahs to both stories; a smaller military hospital, convict barracks, the court-house, police and commissariat offices, custom-house, new gaol, &c. Sydney has two English churches, a Rom. Cath. chapel, a handsome Gothic building, with chapels for Presbyterians, Wesleyans, &c. Among its educational institutions, are the Australian College and Sydney College, which furnish superior instruction in classics, mathematics, and English literature; a normal institution, with Episcopalian, Presbyterian, and Rom. Cath. schools. There are, also, numerous boarding-schools, and other private seminaries, some of which are said to be very well conducted. Several newspapers are published in the town; and many works have been published, the printing and plates in some of which would do no discredit to the London press. It has also a museum and botanical garden. "The shops in the town are frequently laid out with great taste; they are not, as in America, 'stores,' where every article may be bought under the same roof; but each trade or business has its own distinct warehouse. House rent is high at Sydney, and as may be inferred from the fact that building land has been recently sold, in George Street, at the rate of 20,000*l.* an acre! Several commercial establishments are of considerable size; auction-rooms have been lately built by one individual at a cost of 5,000*l.*, and 20,000*l.* has been expended on one distillery. Large sums have been spent also in erecting steam-engines, mills, &c.; a good theatre has been built on speculation, and the hotels and inns are numerous and excellent." (*Martin's British Colonies*, 424.) The town is partially supplied with water by means of a newly-constructed tunnel, nearly 2½ m. in length.

Sydney is admirably adapted for the capital of a great trading colony. Port Jackson is one of the finest natural basins in the world. It stretches about 15 m. into the country, and has numerous creeks and bays; the anchorage is every where excellent, and ships are protected from every wind. The entrance to this bay is between two gigantic cliffs, not quite 2 m. apart. On the most southerly, in lat. 33° 51' 30" S., long. 151° 16' 30" E., a lighthouse has been erected, the lantern of

which is elevated 67 ft. above the ground, and about 345 ft. above the sea. It is navigable for ships of any burden to the distance of 15 m. from its entrance, or 7 m. above Sydney, up what is called the Pacamatta river. Ships come close up to the wharfs and stores of the town, their cargoes being hoisted from the ship's hold into the warehouses. Sydney is consequently the emporium of all the settlements in this part of Australia, and has a very extensive trade.

Wool is the great article of export, and next to it are whale oil and whalebone, the produce of the southern whale fishery. Timber is also exported in considerable quantities; but the exports of other articles are inconsiderable.

The colony being much more suitable for sheep pasture than for tillage, but little corn is raised. In consequence grain and provisions form very important articles of import from Van Diemen's Land and other places.

ACCOUNT of the Value of the Imports into New South Wales, nine tenths being into Sydney, during each of the Three Years ending with 1840.

	1838.	1839.	1840.
Liquors of all kinds, or spirits, wine, ale, beer, cider, and perry	L. 168,510	L. 209,754	L. 338,494
Clothing, provisions, and other edibles, including sugar, &c.	250,175	470,517	302,119
Other articles of consumption, such as soap, snuff, s, tobacco, &c.	71,817	109,681	108,092
Forage	4,505	22,528	6,551
Articles of apparel, clothing, and bedding	481,801	965,855	787,998
Furniture, and articles of furniture, such as furniture, carriages, plate, &c.	112,229	106,445	122,219
Books or materials for printing, such as books, prints, instruments, printing materials, &c.	51,811	42,218	50,052
Data for use in agriculture, manufactures, trade, and commerce	205,042	216,120	450,996
Coin	56,860	24,115	6,107
Totals	L. 1,385,750	L. 1,788,581	L. 2,162,858

Among other articles, the imports of spirits, in 1838, amounted to 1,151,583 galls.; in 1839, to 1,744,471 do.; and in 1840 to 2,260,774 do. The total quantity of wheat imported during the above 3 years amounted to 539,773 bush.

During the year 1840, the value of the exports from Sydney amounted to 1,251,541*l.*, of which, wool and other colonial articles amounted to 562,172*l.*; the produce of the fisheries to 265,920*l.*; and British and foreign goods re-exported, to 423,452*l.* We subjoin

A STATEMENT of the Quantities of Wool, Whale Oil, and Whalebone exported from N. S. Wales during each of the five years ending with 1840.

Years.	Wool.		Sperm Whale Oil.		Black Whale Oil.		Whalebone.	
	<i>Lbs.</i>	<i>Tons.</i>	<i>Lbs.</i>	<i>Tons.</i>	<i>Lbs.</i>	<i>Tons.</i>	<i>Lbs.</i>	<i>Tons.</i>
1835	5,611,118	1,082	1,119	79	79			
1837	4,255,715	809	1,536	78	78			
1838	5,128,295	980	3,059	174	174			
1839	6,597,581	1,279	1,229	155	155			
1840	7,668,960	1,474	1,298	250	250			

In 1840, wool was valued for export at 15*l.* per lb.; sperm whale oil at 85*l.* per ton, black whale oil at 18*l.* per do., and whalebone at 100*l.* per ton.

Banking has been for a lengthened period one of the principal businesses carried on in Sydney. Four or five joint-stock associations have been established in the town for carrying on banking business, exclusive of several joint-stock banking associations in London which have branches in Sydney. The oldest of the native establishments, the bank of New South Wales, was founded in 1816. The banks have frequently divided at the rate of 20 and 22 per cent. per annum of profit. Recently, however, there has been a great over-issue of paper, which has been at once a cause and a consequence of the late over-trading. It has been estimated that the paper aloft in Sydney, in March, 1841, and the 1841 discounted, amounted together to above 2,600,000*l.*; whereas, in March, 1837, they did not together exceed 1,000,000*l.* Sydney has also a savings bank, with numerous joint-stock associations for conducting the business of insurance, and steam, gas, and auction companies have been established.

The aggregate number of convicts that arrived in New South Wales from 1828 to 1836, inclusive, was 30,090, and of free emigrants, during the same period, 10,634.

The British settlements in New South Wales were originally intended to serve as penal establishments, to which convicts might be transported, and employed in public and private works, and are still used for that purpose. The first vessel with convicts arrived in January, 1788, at Botany Bay; but it having been found quite unsuitable for a colony, the settlement was removed to Sydney. The progress of the colony has been much more rapid than might have been anticipated, considering its immense distance from Europe, the general inferiority of the soil, the prevalence of droughts, and the large amount of convict pop. Its progress has been principally owing to the boundless extent of its unoccupied lands, their suitability for sheep pasture, and the unprecedented and extraordinary increase in the stock of sheep and in the exports of wool. In illustration of this in-

Consider the character of a large proportion of the population, one need not be surprised at the circumstance of drunkenness being a prevalent vice, and, consequently, that spirits and wines are largely imported. The other great articles of importation are manufactured goods and apparel of all sorts, hardware, earthenware, saddlery, and carriages, &c. from England.

The value of the imports into Sydney has, for a lengthened period, uniformly exceeded the value of the exports, the balance being met by the expenditure on account of government, the disbursements of ships visiting the port, &c. But during the three years ending with 1840, there has been a great deal of overtrading at Sydney, and the value of the imports having very greatly exceeded the means of payment, and the real wants of the colony, much temporary embarrassment and distress have followed. We subjoin some statements illustrative of the trade of Sydney for some years past.

increase we may state that, in 1822, the exports of wool from the colony amounted to only 152,880 lbs.; in 1825 they had increased to 411,600 lbs.; in 1839 to 899,750 lbs.; and in 1840 to the prodigious amount of 7,668,960 lbs.; and the probability is that the increase in time to come will be equally great.

From the circumstance of the great majority of the convicts and other emigrants being males, a great disproportion has always existed between the sexes in the colony. Government of late years endeavoured to lessen this disproportion by sending out considerable numbers of young unmarried females free of expense. The most conflicting accounts have been received as to the conduct of these females on their landing, and the influence of their immigration on the colony. It appears to be sufficiently established that the latter has, in many respects, fallen short of the anticipations of its promoters; but on the whole there can be no doubt that the measure has been advantageous, and that it has tended not only to increase the population, but to improve the morals of the colony.

Since the plan was acted upon of selling lands in the colony, a considerable sum has been in the habit of expending the whole, or a large proportion of the revenue derived from such sale in bounties for the encouragement of immigration. According to a proclamation issued in the colony, in 1840, a bounty of 38*l.* is granted towards defraying the expense of every agricultural labourer, carpenter, bricklayer, &c. arriving in the colony with his wife, provided neither be above 40 years of age. Bounties are also paid on the children of such persons; and on unmarried males and females arriving in the colony. In consequence of this encouragement a very powerful stimulus has been given to immigration. In 1840 no fewer than 14,392 persons left the different ports of the United Kingdom for Australia, of whom 7,448 were destined for Sydney; and in 1841 the emigration was still greater. (*Sydney Advertiser* for 1841. *Private Information with respect to Sydney: Part. Returns as to Emigration.*)

SYLHET, a distr. of British India, presid. Bengal, beyond the Brahmaputra, and chiefly between the 24th and 25th degs. of lat. and the 91st and 93d of E. long., having N. the territory of the Cossicals, and Jynteah, E. Cachar, S. Tipperah, and W. the distr. of Myen-nung and Dacca. Area, 3,532 sq. m. Pop., in 1822, 1,083,720, it being one of the most densely peopled portions of the British dominions in the East. Its borders are mountains, and on the E. and S. the mountains rise to the height of about 6,000 ft.; but its central part, which is flat and intersected by the Barah, and a great many other rivers tributary to the Brahmaputra, is covered with rice fields, &c. Cotton and sugar are raised in considerable quantities; and Sylhet produces the finest oranges and limes throughout British India: they are grown in extensive plantations, or rather forests, and exported to a great extent. Chumam, wax, also wood, wild silk, and elephants, are among the other chief products; and coal of a very fair quality has been somewhat recently discovered. Boat-building is pursued pretty extensively, and Sylhet shields are articles much prized by the natives of Hindostan. The land is, in general, very much divided: land revenue in 1829-30, 363,516 rupee s. Mohammedans are very numerous in this district. Sylhet, its chief town, and the residence

of the principal authorities, is on the Soormah, in lat.  $24^{\circ} 55' N.$ , long.  $91^{\circ} 40' E.$  (*Hamilton; Pemberton, on the E. Frontier.*)

SYRA (an. *Syracus*), an island belonging to Greece, in the group called the N. Cyclades, the port of Syra, on the E. side of the island, 15 m. W. from the greater Delos, being in lat.  $37^{\circ} 29' 30'' N.$ , long.  $24^{\circ} 55' E.$  It is about 10 m. in length, N. and S., and 5 m. in breadth. Though rugged and not very fruitful, it is well cultivated; and the pop., which in 1825 was not supposed to exceed 4,500, is now (1842) estimated at above 25,000! It is indebted for this extraordinary increase of pop. to the convenience and excellence of its port and its central situation, which have made it a considerable commercial entrepôt. Most part of the trade that formerly centred at Scio is now carried on here; and the island has not only received numerous immigrants from that island, but also from many other parts of Greece. Great Britain and most European powers have consuls in Syra; and it also is the principal seat of the Protestant missionaries to the Levant. The town, which is in great part old, has several new streets and houses, and has an appearance of great bustle and animation. Phrycides, one of the most celebrated of the ancient Greek philosophers, the disciple of Pittacus, and the master of Pythagoras, was a native of this island. We subjoin an

Account exhibiting the Number of Ships, their Tonnage, and the Value of their cargoes, that arrived at Syra in 1839, specifying also the different Countries to which they respectively belonged.

Countries.	Vessels.	Tonnage.	Value of Cargoes.
British	61	10,572	164,265
Greek	92	65,171	188,110

Jerusalem	3	221	1,112
Total	1,542	156,141	466,116

SYRACUSE (an. *Syracusa*), a famous city of Sicily, cap. of an independent district, and cant. on the E. coast of the island, 31 m. S.S.E. Catania; lat.  $37^{\circ} 2' 58'' N.$ , long.  $152^{\circ} 16' 10'' E.$  Pop., in 1831, 16,800; but said to have been considerably reduced during the interval from the influence of cholera, and other causes. The modern city is wholly confined to that small portion of the site of the ancient city included in the island of Ortygia, separated from the mainland by a fosse, and projecting S. in the shape of a narrow peninsula, enclosing between it and the mainland the noble basin called the Great Harbour, which its security, and the facility of its access, render one of the best ports in the Mediterranean. (*Smyth's Sicily*, 163.) Outside the peninsula is the Little Harbour (an. *Trogilus*). Syracuse is pretty strongly fortified, being defended by a bastioned wall, and other works. The port is protected by the castle of Maniace, near the S. extremity of the peninsula. The modern city has little except its ancient renown, its noble harbour, and the extreme beauty of its situation, to recommend it. The temple of Minerva has been converted into the cathedral; but the portico and front, having been destroyed by an earthquake, are modern, and in bad taste. It has several other churches, with numerous convents, a seminary for the clergy, a college for general studies, an hospital, a lyceum, extensive barracks, a museum, and a public library. There are some remains of the temple of Diana, but they are unimportant. The famous fountain of Arethusa (see ARETHUSA), the great glory of ancient Syracuse, is now defiled by the admixture of the sea, and is degraded into a sort of washing-tub for the poorer class of town's-women. The commerce of the city, the principal source of its wealth in antiquity, is also quite inconsiderable; its exports consisting only of trifling quantities of oil, corn, fruits, hemp, salt-petre, &c. "Its streets are narrow and dirty; its nobles poor; its lower orders ignorant, superstitious, idle, and addicted to festivals. Much of its fertile land is become a pestilential marsh; and that commerce which once filled the finest port in Europe with the vessels of Italy, Rhodes, Alexandria, Carthage, and every other maritime power, is now confined to a petty coasting trade. Such is modern Syracuse! Yet the sky which enshrouds it is still brilliant and serene; the golden grain is still ready to spring almost spontaneously from its fields; the azure waves still beat against its walls to send its navies over the main; nature is still prompt to pour

forth her bounties with a prodigal hand: but man, alas! is changed; his liberty is lost; and with that the genius of a nation rises, sinks, and is extinguished." (*Hughes's Greece*, &c., i. 55, 8vo. edit.)

The ancient Syracuse was founded by a colony from Corinth, about anno 736, B. C. Its advantageous situation, and the commercial enterprising spirit of its inhabitants, speedily raised it to the highest distinction. Cicero calls it the greatest and most beautiful of Greek cities: *Urbsm Syracusam maximum esse Græcarum urbium, pulcherrimam omnium, sæpe adistit.* (In Verrem, lib. iv. cap. 52.) As soon as it had outgrown the limits of the original city, which, like the modern, was confined within the island of Ortygia, it began to extend towards the N., covering, when in its zenith, a large triangular space; which, rising precipitously from the sea on the one hand, and the plains to the W. on the other, admitted of being easily fortified. This new city terminated on the N. in the hill of Epipolæ, which, however, was not included within it till the time of the elder Dionysius, who constructed at that point the fortress of Hexapylon, the vast ruins of which still attest its former strength and importance. "The city was defended partly by lines of rocks, and partly by strong walls. Its circuit is estimated by Strabo at 180 stadia, or about 20 Eng. m.; and supposing that the simosities of the walls were followed, this statement is probably not very wide of the mark. Among the advantages of the situation chosen for the site of the new city, was its inexhaustible supplies of fine freestone; which, though soft, and easily wrought in the quarry, became, by exposure to the air, sufficiently hard.

The space included within the walls of the new or N. city comprised, 1. the quarter of Acradina, the largest and most populous of the whole, adjoining the island of Ortygia, having E. the sea; it contained the temple of Olympian Jupiter, the forum, the prytæum, &c.; 2. the quarter called Tyche, from its temple to Fortune (Tyche), lying N.W. from Acradina; and 3. the quarter called Neapolis, or the New City, from its being the last built; this, which was the most westerly portion of the city, and was bounded in part by the Great Port, contained a spacious theatre, cut in the rock, upon the slope of a hill; and two temples, one dedicated to Ceres, and one to Libera or Proserpine. (*Cicero, ubi supra.*)

Among the existing remains of Syracuse, the most extraordinary, perhaps, are the *latomæ*, or prisons. These are immense excavations cut in the solid rock to a great depth, with steep overhanging sides, whence all egress is impossible. They appear originally to have been quarries (whence their name), and to have been subsequently formed into prisons. They have been forcibly and admirably described by Cicero:—*Latomus Syracusanus omnes auditus, plerique nostros; omnes ingens magnificens regem ac tyrannum; totum esse ex saxo in mirandam altitudinem, dypræssu, et multorum operis penitus excisio. Nihil tam clausum ad carceris, nihil tam septum undique, nihil tam tutum ad custodias, nec ferreæ cegatari potest.* (In Verrem, ult. cap. 27.) In the N.W. angle of the *latomæ* of the Neapolis is the famous cavern called the Ear of Dionysius. It runs into the heart of the hill, in the form of the letter S, the sides being chiseled quite smooth, and the roof gradually narrowing to a point, along which runs a groove, which collected, as is supposed, the sounds of the voices of the prisoners. It derives its name from the popular belief that Dionysius was accustomed to incarcerate in it those he supposed inimical to his authority; and that, by applying his ear to one end of the groove, and listening to their conversation, he ascertained whether his suspicions were well-founded. There appears, however, to be little or no foundation for this story; though, from the care bestowed on its construction, it must evidently have been intended for some special purpose.

The *latomæ* on the hill of Epipolæ were selected as the place of confinement for the miserable remains of the vast armament fitted out by Athens for the reduction of Syracuse. About 7,000 men are said to have been shut up in this prison, exposed alternately to the heats of a vertical sun, rendered more intolerable by its reflection from the surrounding rocks, and to the chills of the evenings, with insufficient supplies of food, and without any means of preserving cleanliness, or even of escaping from the contact of the sick and dead. Every hardship was accumulated on the heads of the unhappy sufferers; till at length, after an interval of above two months, most part of those that survived were brought forth to be sold as slaves. (*Thucyd.*, lib. vii. *ad finem.*) The *latomæ* were also used by Verres for the imprisonment, not merely of Syracusan, but of Roman citizens.

The catacombs, in the Acradina, are of vast extent, and may be truly called a city of the dead. They consist of a principal and several smaller streets, all excavated in the rock, with deep contiguous recesses on each side, containing coils for the reception of the dead. Various

theories have been formed as to the era of the formation of these vast subterranean excavations, which, no doubt, belong to a very remote antiquity.

On the whole, however, considering the great extent of the city, and the number and magnificence of its public buildings, the continental portion of Syracuse, with the exception of the *latomia* and catacombs, and some remains of the walls, and of aqueducts, has very few monuments of antiquity of which to boast. Swinburne (ii. 334.) and Hughes (ii. 82.) express their astonishment at the almost total disappearance of all vestiges of the great public and other buildings, with which the city was once filled. This, however, is not inexplicable: the sea has undermined a portion of the walls of Acradina; and the perishable nature of the stone of which the city was built, added to the influence of earthquakes, the ravages of war and of barbarians, and the accumulation of rubbish, have made Syracuse, like Carthage, *non agnosceda propriis ruinis*. Among the ruins of some baths, excavated in 1810, was found the torso of a Venus, worthy of the best age of the art, and now the pride of the museum.

Various estimates have been formed of the pop. of Syracuse when in the summit of its prosperity. These, however, are mostly all exaggerated, and entitled to but little attention. Thucydides says that it was nowise inferior to Athens (lib. vii. p. 503.), and that it was a very large and splendid city is a fact of which there can be no manner of doubt; but owing to the great extent of the open spaces and public buildings within its walls, its pop. could not be in any degree proportioned to what would be contained in a modern city of the same size. Probably it may have amounted to 200,000; or, at most, 250,000; though, if anything, we suspect that this estimate is beyond the mark.

Syracuse appears at first to have been under a republican government; but it subsequently became subject to kings, or tyrants, of whom Gelon and Hieron were among the earliest and most celebrated, the triumph of the latter in the chariot-race at the Olympic games having been the subject of one of Pindar's noble odes. But Thrasylbus, the younger brother of the latter, having been expelled the city, the republican form of government was restored.

\*The Syracusans having been involved, during the course of the Peloponnesian war, in contests with other cities of Sicily, the Athenians sent a fleet to the assistance of the latter; and from less to more, Athens became so innately mixed up with Sicilian affairs, that she determined to bring them to a satisfactory conclusion, by undertaking the conquest of Syracuse itself. The greatest exertions were made to effect this grand object: the zeal of the public was supported by the zeal of private individuals; and the argument fitted out by Athens for the reduction of Syracuse is universally admitted to have been the greatest and most splendid ever sent forth by any Greek state. The events of this contest, which fixed the attention of all Greece, have been described by Thucydides, and form the most interesting portion (lib. vi. and vii.) of his history. It is sufficient here to state, that the failure of the expedition was as complete as the hopes of success had been sanguine. Alcibiades, who had assisted in planning the expedition, and whose genius might have conducted it to a successful issue, having been unwise removed from the command, was succeeded by Nicias, an able general, but one who had been hostile, from the outset, to the project, and who, though brave and experienced, wanted the ability and decision required for the conduct of such an enterprise. After various vicissitudes, the besiegers and besieged changed places. The defeat of the Athenian fleet, which had been cooped up in the great harbour, in an attempt to force a passage through their enemies, may be said to have terminated the expedition, and with it the glory and empire of Athens. "In hoc portu," says Cicero, speaking of the great harbour, "*Atheniensium nobilitas, imperii, gloria naufragium factum existimatur.*" (In Verrem, v. cap. 37.)

A few years after the defeat of the Athenians, which occurred anno 413 B. C., the supreme direction of affairs at Syracuse was usurped by Dionysius the Elder, whose character presents a singular compound of greatness and meanness, generosity and cruelty. Dionysius the Younger, who succeeded his father, was finally expelled from Sicily by Timoleon: who, having demolished the citadel constructed by the elder Dionysius, and his magnificent tomb, restored the Syracusans to their freedom, and, having vanquished their enemies, retired into private life.

They did not, however, long preserve the liberty given them by Timoleon. In the course of a few years, Agathocles attained to the supreme authority. After his death, the city underwent various revolutions, being sometimes the ally of the Carthaginians and sometimes of the Romans. In the end it was subjugated, though not without a vigorous resistance, by the latter.

The siege of Syracuse by the Romans under Marcellus is one of the most celebrated in history. It withstood, for a lengthened period, all the efforts of the Roman

general, who had to contend, not only against the natural strength and fortifications of the place, but also against the extraordinary talents and wonderful machines of Archimedes, the greatest geometer, and one of the greatest geniuses of antiquity. At length, however, the Romans gained possession of the city, anno 200 B. C., partly by stratagem, and partly by the treachery of one of the Syracusan leaders. Archimedes unfortunately lost his life in the confusion that followed the taking of the city. (*Livius*, lib. xxv. cap. 23—31.)

Under the Romans, Syracuse continued to be a great and important city. It was taken by the Saracens in 878, and given up to military execution. But, notwithstanding this and many subsequent calamities, it continued to be of considerable importance till 1693, when it was laid in ruins, and most part of its ancient monuments destroyed, by the dreadful earthquake of that year.

In addition to Archimedes, Syracuse has to boast of having given birth to Theocritus, the first and greatest of pastoral poets, and to Moschus. (In addition to the works referred to above, see *S. R. C. Hoare's Classical Tour*, li. 141—175.; *History of Syracuse*, in *Ancient Universal History*, vols. vii. and viii., 8vo. ed.; *Plutarch's Life of Marcellus*, &c.)

SYRIA and PALESTINE or JUDEA, two of the most celebrated regions of the E. hemisphere; the former includes the ancient Phœnicia; and the latter is sometimes called the Holy Land, from its being the theatre of most of the great events recorded in sacred history. These famous countries have, for many centuries, ceased to be independent, and have for a lengthened period formed a portion of Asiatic Turkey: they extend principally between the 31st and 37th degs. N. lat., and the 34th and 41st E. long., having N. the pachaies of Ictchil and Marshi, in Asia Minor; N.E. and E. the Euphrates; S.E. and S. the Arabian Desert; and W. the Mediterranean. Previously to the subjugation of the country by Mehemet Ali, it was divided into the four pachaies of Aleppo, Tripoli, Acre, and Damascus. Palestine, or the Holy Land, comprised in the two latter pachaies, forms the S. portion of the region, being about 200 m. in length by 80 m. in its extreme breadth. The entire length of Syria in Palestine may be about 450 m. N. and S.; its breadth varying from 100 to 280 m. Its area has been loosely estimated at 48,000 sq. m.; and its pop. at from 1½ to 2, and even 3 millions; but probably 1,500,000 may not be far from the mark. (*Bowring's Report on Syria*.) Colonel Campbell, a few years since, estimated it at 1,864,000; of whom 957,000 were supposed to be Mussulmans (Turks, Arabs, &c.), 22,000 Ansarians, or Bedouins, 17,000 Metualis and Yezidis, 48,000 Druses, 250,000 Maronites and Christians of the Romish church, 345,000 Christians of the Greek church, and 175,000 Jews. The practice of polygamy among several of these tribes, aided by the extensive conscriptions of Mehemet Ali, is said to have produced a great excess of females over males. (*Bowring's Physical Geog.*, pp. 4, 5.)

The W. or coast portion of Syria is mountainous, while the more inland portion, or that to the E. of the Orontes and Damascus, is mostly flat. The mountains run mostly N. and S., parallel to the Mediterranean. The principal chain, in different parts of its course, is termed Alma-Dagh, (an. *Mons Amanus*.) Jeb-el-Anzeyry, and Lebanon; it runs at an average distance of about 24 m. from the sea, from the range of Taurus, in Asia Minor, as far S. as the vicinity of Tyre, where it terminates. The chain of *Anti-Libanus* detaches itself from the foregoing in about lat. 34°, and running S. parallel to, and at no great distance from the latter, encloses the famous valley anciently called *Cœle-Syria*. About where Libanus terminates, Anti-Libanus divides into two chains, enclosing the valley of the Jordan, the Dead Sea, &c., continuing subsequently to bound the valley of *El Ghor* to the head of the Gulf of Akaba. Both Libanus and Anti-Libanus give out numerous lateral spurs, some of the former extending so as to project, like Mount Carmel, in bold headlands on the coast. These subordinate ranges, with the W. declivity of Libanus, and the E. declivity of Anti-Libanus, are by far the most fertile portions of the mountain system. Cœle-Syria, though fertile itself, is enclosed between precipitous and barren heights. The mountains which surround the Dead Sea, and those to the W. of the Jordan, are arid, stony, and full of precipices and caverns, and have a melancholy, desolate appearance, harmonising well with that of the desert by which they are bounded on the E. For further details respecting the mountain region of Syria, see *LEBANON*, ante, p. 146. Palestine consists principally of rugged hills and narrow valleys. It has, however, some fertile plains of considerable size W. of the mountains; as that of Esdrælon (an. *Mejiddo*), 30 m. in length, by 18 in breadth; that of Sharon, famous in antiquity for its roses (supposed to be the flower of a species of *cistus*, with which it is covered); but by far the most extensive and valuable plain is that of Hamran. E. of the Jordan and of Mount Gilead, and trenching on the 'Desert.' By the great Syrian de-

sert, however, we are not," says Mr. Addison, "to understand, a bare wide waste of sand, like the great African desert. The term must be considered to mean destitute of settled inhabitants, towns, villages, and houses, and peopled only by roving pastoral tribes. Instead of sand, the uninhabited district beyond Damascus consists of a fine black soil, covered with long, burnt-up, rank grass and herbs, and inhabited by antelopes, wild asses, and wild boars, which search out the thinly scattered spots where water is to be found. The same description of country, we are told, continues the whole way to Palmyra. In summer the soil is parched and cracked into innumerable fissures by the burning rays of the sun, and the herbage and vegetation are all killed; but having previously come to maturity, and scattered their seed upon the ground, no sooner do the winter rains commence than the dry grass is beaten down and rotted, and the seeds, moistened by the abundant rains, sprout up with astonishing luxuriance. In summer, the Bedouins are obliged to congregate in the vicinity of pools and wells; but in winter they spread themselves over the wide surface of the desert, and make long journeys with their flocks and herds." (*Damascus and Palmyra*, ii. 216, 217.)

The principal rivers of Syria are the Euphrates, Jordan, and Orontes, severally noticed in this work. The coast line is watered by numerous small streams, falling into the Mediterranean, which contribute greatly to fertilise the land: but of these none are navigable. The largest and most remarkable lake is that of Asphalites, or Dead Sea (which see, i. 679.) The next in size is that of Tiberias, or Gennesareth, the theatre of some most remarkable miracles. (Luke and Matt. viii.; Matt. xiv. 25.) It is about 16 m. in length, from 5 to 6 m. in breadth, and is traversed throughout its centre by the Jordan, of which, in fact, it may be regarded as an expansion. On its E. side it is confined by bold, barren, and precipitous mountains; but elsewhere its shores are generally level. According to Dr. Clarke, "It is longer and finer than any of our Cumberland or Westmoreland lakes, though it be perhaps inferior to lake Lomond, in Scotland. It does not possess the vastness of the Lake of Geneva, although it much resembles it in certain points of view. In picturesque beauty it comes nearest to the lake of Locarno in Italy, although it be destitute of any thing similar to the islands by which that majestic piece of water is adorned. It is inferior in magnitude, and perhaps in the height of its surrounding mountains, to the lake Asphalites, but its broad and extended surface, added to the impression under which every Christian pilgrim approaches it, gives to it a character of unparalleled dignity." (*Travels*, iv. 216.) Its unbroken margin, and the total absence of wood on its shores, without a boat or vessel to be seen throughout its whole extent, give it a melancholy, monotonous appearance.

Several combats took place on the lake between the Jews and Romans, and its banks were formerly the seat of several flourishing cities. Of these, however, Tiberias, is almost the only existing relic. The lake of Gennesareth, like all other inland seas, is subject to squalls and sudden gusts of wind, that render its navigation rather dangerous. The *Bahr-el-Margi*, near Damascus, and the lakes of Horus, and of *Agri Dengia*, near Antioch, are the only others worth notice. The coast of Syria and Palestine presents a nearly straight line, extending through six degrees of lat., being but little indented by arms or inlets of the sea, the principal being the bays of Scanderoon and Antioch; and though it was in antiquity the seat of a great maritime people, it has very few good harbours: the best are those of Scanderoon and Acre. The former, however, is inconveniently placed, quite at the N. extremity of the country, and is besides very unhealthy. The harbours of Tyre, Sidon, &c., so famous in antiquity, are now, for the most part, filled with sand, or otherwise choked up.

*Geology and Minerals.*—Of these we have no authentic information. The prevalent rock is limestone, abounding in fossil remains, and hollowed into numerous caverns. The higher parts of the Libanus ranges seem, however, to consist of greywacke, slate, and other transition rocks, and the rocky mountains skirting the Dead Sea, of granite, gneiss, dolomite, &c. Antioch is situated in a great tertiary basin, every where broken, however, by serpentine and diallage rocks. (*Geog. Journ.* vii. 420.) "The whole of the Hauran," says Elliott, "is covered with a species of blue stone, very hard, yet porous, and of which all the mill-stones of Syria are made." Volcanic matters cover a considerable extent of country, and the traces of extinct volcanoes are met with in many places. There are occasional indications of coal; but, except building stone, salt, with which a great part of the soil is highly impregnated, and asphaltum, from the vicinity of the Dead Sea, are almost the only mineral products of much value.

*Climate.*—Owing to the great differences of elevation and exposure, the greatest dissimilarity prevails with re-

spect to temperature. On the whole, however, the country may be said to have two climates; one very hot, which is that of the coast and the interior plains, such as those of Balbec, Antioch, Tripoli, Acre, Gaza, Hauran, &c.; and the other, or that of the mountains, at least at a certain height, temperate, and similar to that of France.

(*Volney*, i. 314., Eng. trans.) In most parts, the occurrence of the rainy seasons, as well as the quantity of rain which falls, are very variable. The winter in the plains is so moderate, that the orange, date, banana, and other delicate trees, flourish in the open air; and it appears equally extraordinary and picturesque to the European at Tripoli to behold under his windows, in the month of January, orange-trees loaded with flowers and fruit, while the lofty summits of Lebanon are seen covered with ice and snow. But in the more northerly parts of the country, and to the E. of the mountains, the winter is more rigorous, without the summers being less hot. This is occasioned by the E. plains being high above the level of the sea, exposed to the parching blasts of the E. and N.E. winds, and screened by the mountains from the humid winds from the W. and S.W. that sweep over the Mediterranean. At Aleppo the rains commence about the middle of December, and usually last for six weeks or two months. The frosts, however, are seldom of any considerable intensity; snow rarely lies above a day; narcissus are in flower during the whole of this season; and hyacinths and violets make their appearance before it is over. Spring commences in February, and is extremely pleasant, having no defect but its short duration. Early in May corn is nearly ripe; and by the end of that month the heats commence, and the country begins to assume a parched and barren aspect. From this period to the middle or end of September no rain ever falls; and the inhabs. sleep exposed on their terraces, without danger from damps or other noxious influences. At Aleppo an interval of between 20 and 30 days usually occurs between the first and second rains; during which period the weather is serene and extremely delightful; and if the rains have been at all heavy, though but of a few hours' duration, the country assumes a new face. After the second autumnal rains the weather becomes variable, and winter approaches by degrees. The vernal are heavier than the autumnal rains; and, like the latter, are often accompanied with thunder. The trees frequently retain their leaves till the beginning of December. The heats of summer are usually tempered by westerly breezes; but when during this season the *samiet* occurs, that is, when the winds blow from the Arabian and Persian deserts, or from the E. inclining to the S., the heat becomes suffocating and excessive; and the inhabs. have no resource but to shut themselves closely up in their houses. Luckily, however, these winds are not of very frequent occurrence; and sometimes they do not occur once in a summer. Shocks of earthquakes are common; and, in 1822, Aleppo and several other towns were nearly destroyed by one of these visitations. (*Volney*, i. 315.; *Russell's Aleppo*, 10—14 &c.)

It is clear, therefore, as Volney has stated, that "Syria unites a great variety of climates, and collects within a narrow compass pleasures and productions which Nature has elsewhere dispersed at great distances of time and place. With us, for instance, seasons are separated by months; there, we may say, they are only separated by hours. If in Saïde or Tripoli we are incommoded by the heats of July, in six hours we are in the neighbouring mountains, in the temperature of March; or, on the other hand, if chilled by the frosts of December, at Be-sharral, a day's journey brings us back to the coast, amid the flowers of May. The Arabian poets have therefore said, that 'the Sannin (Lebanon) bears winter upon his head, spring upon his shoulders, and autumn in his bosom, while summer lies sleeping at his feet.' I have myself experienced the truth of this figurative observation, during the eight months I resided at the monastery of Mar-Hanna, seven leagues from Beyrout. At the end of February I left at Tripoli a variety of vegetables which were in perfection, and many flowers in full bloom. On my arrival at Antoura I found the plants only beginning to shoot; and at Mar-Hanna every thing was covered with snow. It had not entirely left the Sannin till the end of April; and already, in the valley it overlooks, roses had begun to bud. The early figs were past at Beyrout, where they were first gathered with us, and the silk-worms were in cod before our mulberry-trees were half stripped.

"To this advantage, which perpetuates enjoyments by their succession, Syria adds another, that of multiplying them by the variety of her productions. Were nature assisted by art, those of the most distant countries might be produced within the space of twenty leagues. Even at present, despite the barbarism of a government inimical to all industry and improvement, we are astonished at the variety this province affords" (i. 317.)

It is true that Syria and Palestine are sometimes visited by the plague; but this is a consequence of slut-

Unhness, and the want of proper care and precautions. Dysenteries, leprosis, &c. are also frequent; but, on the whole, the country is highly salubrious; and has no peculiar disease, except the pimple or ulcer of Aleppo. (See ALEPPO.)

**Products and Resources, &c.**—The beauty, fertility, and various products of Syria made her be regarded as one of the finest and most fruitful of countries; and her superiority in those respects has been extolled by the best modern travellers. It seems unnecessary, therefore, to dwell on what is so generally admitted. But the question as to the fertility of Palestine has given rise to some conflicting statements, and as the subject possesses peculiar interest, we shall notice it at some little length.

In the sacred writings, the fertility of the Holy Land is described in the most striking manner. Moses calls it a land that floweth with milk and honey; a land of brooks and waters, of fountains and depths, that spring out of the valleys and hills; a land of wheat and barley; of vines, figs, and pomegranates; of oil, olives, and honey; a land where there is no lack or scarcity of any thing; whose stones (or rocks) are iron; and out of whose mountains brass may be dug up. (Deuteronomy, viii. 7, &c.)

It may, perhaps, be permitted to suppose, that as Moses wished to reconcile the Jews to the territory on which they were about to enter, and to extinguish any lurking desire on their part to return to the "flesh pots" of Egypt, he would represent the "promised" land under the most favourable colours. On the whole, however, it would seem, despite the statements that have been made to the contrary, that his description is substantially correct. It is strikingly confirmed by Tacitus, who says, speaking of Palestine, *Rari imbres, ubi SOLUM. Exuberant fruges, nostrum ad normem; præterque eas balsamum et palmæ.* (Hist. lib. v. cap. 6.) It is true that Strabo, in his 16th book, speaks in very contemptuous terms of the country round Jerusalem; but he was by no means so well acquainted as Tacitus either with the history of the Jews or with Judea; and besides, even though the accuracy of his statement as to the country to which he has referred were admitted, that would not authorise any inference to be drawn unfavourable to the general fertility of Palestine. In antiquity Judea was very carefully cultivated; and notwithstanding the great density of its pop. it is said, when in the zenith of its prosperity, under Solomon, to have exported considerable quantities of corn. (1 Kings, v. 11.) The declivities of the hills were formed into terraces, of which the vestiges still remain (*Maunderell*, p. 66, ed. 1740), and were covered with plantations of figs, vines, and olives. It was, as Tacitus has stated, particularly celebrated for its palm-trees, which, in fact, were the emblem of the country; and the aromatic plants that grew in the uncultivated parts furnished the wild bees with the honey which they stored in the hollows of the rocks and trees. Indeed *Maunderell*, whose accuracy is unquestionable, states that he perceived in many such places "a smell of honey and wax as strong as if one had been in an aviary." (*Id. loc. cit.*) We cannot, however, form any fair estimate of the state of the country in antiquity from the condition in which we find it at the present time, seeing it has groaned for centuries under the yoke of barbarous tyrants, and been subjected to every species of tyranny and oppression. "The Holy Land," says Dr. Shaw, "were it as well peopled and cultivated as in former times, would still be more fruitful than the very best part of the coast of Syria and Phœnicie, for the soil is generally much richer, and, all things considered, yields a more preferable crop. Thus the cotton that is gathered in the plains of Ramah, Esdraelon, and Zabulon, is in greater esteem than what is cultivated near Sidon and Tripoli. Neither is it possible for pulse, wheat, or any sort of grain, to be more excellent than what is sold at Jerusalem. The barometer, or scarcity rather, which some authors may either ignorantly or maliciously complain of, doth not proceed from the incapacity or natural unfruitfulness of the country, but from the want of inhabitants, and the great aversion there is to industry and labour in those few who possess it. There are, besides, such perpetual discords and depredations among the petty princes who share this fine country, that allowing it were better peopled, yet there would be small encouragement to sow, when it was uncertain who should gather in the harvest. Otherwise the land is a good land, and still capable of affording its neighbours the like supplies of corn and oil which it was known to have done in the time of Solomon." (*Travels*, p. 336. 4to. ed.)

At a more recent period Dr. Clarke said of the Holy Land, "The delightful plain of Zabulon appeared every where covered with spontaneous vegetation, flourishing in the wildest exuberance. The scenery is to the full as delightful as in the finest parts of Kent and Surrey. It reminded us of the finest parts of Kent and Surrey. The soil, although stony, is exceedingly rich. We found the valleys W. of Jerusalem covered with plentiful crops

of tobacco, wheat, barley, Indian millet, melons, vines, pumpkins, and cucumbers." (*Trav. iv. 423.*)

These statements are more than sufficient to attest the natural riches and fertility of this famous region. As an agricultural or corn-growing country it is, indeed, far inferior to Egypt and many other states; but the variety of its surface and products, the salubrity of the climate, and the productiveness of its cultivated lands, would make it, were it possessed by an industrious, well-governed people, a most desirable country.

Recently, however, the condition of Syria and Palestine has been changed materially for the worse, as compared even with what it was at the epoch of Clarke's visit. The destructive contests of which it has been the theatre, the consequent destruction of property, the interruption of all sorts of industry, and the emigrations occasioned by the conscriptions of Mehemet Ali, have reduced Syria and Palestine to a state of depression to which they had never previously sunk, and from which there is but little hope of their recovering under their present rulers.

During the ascendancy of the Egyptians Mehemet Ali attempted to introduce the same compulsory or forcing system into Syria and Palestine that he has introduced into Egypt (which see). In this view the principal officers of the government and the army, and the more opulent inhabitants, were compelled to undertake the task of restoring ruined villages, and the culture of their lands. Government intended, by means of the increased cultivation of wheat and barley, to render Syria independent of supplies from without; and, if possible, to obtain a surplus for exportation. In good harvests, indeed, Syria, particularly its S. part, previously produced sufficient corn for its own consumption; and had the measures undertaken by the Egyptian government been persevered in, there can be little doubt that there would have been a great increase of produce. But in 1837 the influence of the new system was paralysed by a drought; and the events that speedily followed overturned at once the power and the projects of the Egyptians.

The landed property of Syria, as of the rest of the Turkish empire, is supposed to belong to the sultan, as the viceregent of God and the prophet; and the principle, that it did so, in fact, was acted upon, at the conquest of the country, by the caliph Omar, in the 7th, and by the Turks under Selim I., in the 16th century. At present, however, this assumed property of the sultan is a mere legal fiction. Soon after Selim's conquest, the ruinous effects of the general confiscation became so apparent that measures were taken for giving the occupiers a right of property in the land on paying a small quit-rent. Land may now be classed under three heads: that belonging to the sultan and government; *wakouf* or entailed lands; and real property, belonging to the proprietors, and descending by inheritance. The lands and property belonging to the sultan and government are those escheating in different ways; such as lands abandoned in consequence of non-cultivation during three years, lands left by the extinction of families, lands confiscated, &c. Entailed property, called *wakouf el haramcin*, consists of that settled by private individuals for the maintenance of public caravanserais, fountains, and charitable institutions; and of that vested in the hands of the clergy for behoof of certain parties, and their heirs or nearest of kin. Some lands are settled on the eldest heir in perpetuity, and cannot be sold, though they may be exchanged. According to the rule of the Ottoman law, Franks and other foreigners cannot hold land in the Turkish dominions; but, in fact, they do hold it, by means of long leases or otherwise, which make it little less secure than freehold. In the succession of property, the sons inherit twice as much as the daughters.

In Lebanon, almost every male inhabit. is a small proprietor; and in the neighbourhood of Beyrout there are a great number of landholders who, for the most part, cultivate the white mulberry-tree. Large proprietors are few, except among the emirs of Mount Lebanon, some of whom have extensive estates, which they either cultivate on their own account, or let out to farming tenants. (*Flowring's Rep. on Syria*, pp. 101, 102; *La Syrie jusqu'en 1840*, pp. 75–83, 148, 149.)

The *miri*, or land-tax, is not assessed in Syria by any invariable rule, or according to any admeasurement of the land. A government is assessed in a certain amount, which is apportioned among the different villages according to their greater or less amount of pop., or more or less extent of land; and the peasants themselves apportion the payments each has to make. In the cultivation of all kinds of produce, except silk, the landed proprietor supplies the peasantry with seed, and a certain sum of money to buy oxen, cattle, and implements of husbandry; and receives 10, 15, or 20 per cent. of the produce, according as the ground is more or less taxed. The *miri* under is divided into two equal parts, one of which the proprietor takes, and the other is for the

peasants. These last are obliged to repay the money advanced to them, but not the seed. (*Col. Campbell's Report.*)

The old Roman plough, drawn by bullocks, is that almost universally employed. Wheat, barley, maize, millet, lentils, sesamum, &c. are grown principally in the plain of the Haouran, which has always been considered the granary of Syria. It is inhabited by Turks, Druses, and stationary Arabs, and is visited in spring and summer by several Bedouin tribes. Burckhardt computes the resident pop. at from 50,000 to 60,000. The fertility of the soil depends entirely upon the water with which it is supplied; and the harvest is, therefore, in proportion to the abundance of the winter rains, and the extent of artificial irrigation. Lands which cannot be irrigated usually lie fallow every other year; though a part is sometimes sown in spring with sesamum, cucumbers, melons, and pulse. Where an abundance of water may be obtained from neighbouring springs, the soil is sown with lentils, peas, sesamum, &c. after the grain harvest. In middling years, wheat is said to yield 25 times the seed; and the produce of barley is said sometimes to average 50 and even 80 times the seed; though these statements are usually much exaggerated, and but little to be depended on. The first harvest is that of horse-beans, at the end of April: vast tracts are sown with these, to serve as food for cows, sheep, and camels. Next comes the barley, and towards the end of May, the wheat harvest. The wealth of a cultivator is estimated by the number of *fedhans*, or yokes of oxen, he employs. The owner of two or three is estimated rich, and he will probably possess, besides, two camels, a mare or gelding, or a couple of asses, and forty or fifty sheep. Taxes are very heavy in the Haouran. There is, first, the *miri*, paid to the pacha, and which is levied on the *fedhans*, the amount depending on the sum at which the whole village is rated in the pacha's books, and which must be paid so long as the village is inhabited, be the number of *fedhans* employed few or many. Next is the obligation to supply the troops, &c., with provender; and the third and heaviest contribution paid by the villagers is the *khone*, or tribute (identical with the *black-meat* of the Scotch) claimed by the Bedouins, in return for their protection, or rather forbearance. Each village pays *khone* to the sheikh of a tribe, who is then bound to protect the inhabs., and pays a tribute of from 30 and 40 to 400 piastres to the pacha for this privilege. Lastly come the unlimited contributions exacted by the pachas. The receipt of the *miri* of the whole pachalic, which may amount to 250,000*l.*, is in the hands of Jew bankers, who not only get about 5 per cent., but contrive to extort something further on their own account. Families in the Haouran are constantly moving from one place to another. In the first year of their new settlement the sheikh acts with moderation towards them; but his exactions becoming insupportable, they migrate to some other place, where they have heard that their brethren are better treated: they soon find, however, that the same system prevails over the whole country. (*Mod. Trav.* iii. 80-83.) In addition to all these exactions, the crops in the Haouran are sometimes destroyed by mice, though not so often as in the neighbourhood of Hauris and Hamah. But the worst enemies of the agriculturist are the clouds of locusts which sometimes devastate the country, devouring every "green thing." They are not, however, an unmitigated nuisance, having been used for food time immemorial, and are said to be both wholesome and palatable.

The most careful cultivation in Syria is exhibited on the slopes of Mount Lebanon and other inaccessible districts, where the inhab. enjoy a comparative exemption from the exactions of their Turkish masters. "Stimulated by their sense of security, they have, by dint of art and labour, compelled a rocky soil to become fertile. Sometimes, to profit by the water, they conduct it, by a thousand windings, along the declivities, or stop it, by forming dams in the valleys; while in other places they prop up the ground, ready to crumble away, by walls and terraces. Almost all these mountains, thus labour'd, present the appearance of a flight of stairs, or an amphitheatre, each step of which is a row of vines or mulberry-trees. I have reckoned 120 of these gradations on the same declivity, from the bottom to the top of the mountain. So powerful is the influence of even the feeblest ray of liberty and security." (*Volney*, i. 300.)

The mulberry-tree flourishes on the coast and through the more fertile parts of the Lebanon range, and a little more attention to the culture of silk would render it in a few years the principal article of export. The mulberry plants are set in rows 6 or 8 ft. apart; they are cut off at a corresponding height, and suffered to retain only the fresh twigs. The arrangement generally made with the peasantry is to allow them one fourth part of the silk for taking care of the worms, and reeling it off the cocoons. The landowner provides the leaves, which are gathered by the peasants. He also erects the sheds in which the cocoons are kept, which are simple reed enclosures, without

any roof. The quantity of silk annually produced on Mount Lebanon is estimated at about 1,200 cantars, or 240,000 oke, fetching from 120 to 125 piastres the oke, of which about two-thirds are exported. About 400 cantars is considered an abundant crop in the Tripoli district. Aleppo receives about 250 cantars from Antioch, and other quarters. Its chief consumption there is in the manufacture of the cotton and silk goods used for upper garments by the wealthy inhab.; but it is also sent into all parts of the Turkish empire; and, in 1836, 100 cantars were sent to Genoa, France, and England. The average annual produce of cotton in the vicinity of Acro, Jaffa, Nablous, and other places in the S., is estimated from 30,000 to 35,000 cantars, worth about 350,000*l.* In the N. the crops are exposed to great vicissitudes. The quality of the cotton is sometimes good, but more commonly inferior. The export is chiefly to Smyrna, and other parts of Turkey. Not more than from 1,000 to 2,000 cantars reach W. Europe, the quantity that comes to England being very trifling. The oil harvest is very precarious. From 8,000 to 10,000 cantars may be about the average consumption in Aleppo, half of which is produced in the neighbourhood. The average produce around Damascus is estimated at from 4,800 to 5,000 cantars. The oil has of late years been considerably improved, and its quantity augmented by the introduction of oil-presses from France. Wine might become an important article both of consumption and export; and at some of the convents of Lebanon (where the vine is suffered to trail on the ground) a very good wine, called *vino d'oro*, is met with. Madder and indigo grow wild; and the former, as well as the sugar-cane, has been partially cultivated. Ibrahim Pacha introduced the cochineal insect into Syria with every prospect of success; for the cactus, on which it feeds, grows there to an immense size, and forms, in fact, most of the hedges in the country. The dates of Syria are not equal in quality to those of Egypt or Nubia; but the date palm is so abundant, and, as already stated, it was anciently the symbol of judice; and it is probable that Phœnicia was so called from the abundance of this plant (*see*). Tobacco is grown in almost every part of Syria, its consumption being universal both by males and females. The best is found in the districts of Aleppo, Latakia, Tripoli, and Mount Lebanon, large exports taking place from Latakia and Tripoli to Egypt and elsewhere. The total produce is estimated by Col. Campbell at 10,700 cantars a year. Scammony, the juice of a species of convolvulus, which grows in N. Syria, is a valuable article of export; and that from Aleppo is esteemed the best in the markets of Europe. But it is rarely obtained pure; the collectors first adulterating it with flour or starch, to give it colour and consistency; and with myrrh, to give it a bitter, aromatic taste. It is then sold to the Jew dealers, who further adulterate it in the same manner, mixing 4 or 5 rotoli of starch with 1 rotoli of scammony, in which state it is sent to England at a price of from 250 to 300 piastres per rotoli. From 1,200 to 1,500 loads of hemp are produced in the Damascus district; but it is not an article of export. From 200 to 250 cantars of bees' wax are annually collected in the Aleppo district, nearly half of which is sent to Europe.

The forests of N. Syria have lately supplied large quantities of timber; the arsenals and dockyards of Egypt having been principally furnished from this source. From 70,000 to 80,000 trees, large and small, or about 14,000 tons of timber, principally pine, oak, and beech, were shipped in 1837 for Alexandria.

The Holy Land in antiquity was eminently distinguished for its abundance of cattle, including sheep, goats, camels, and asses; and though much diminished in numbers, these animals still constitute a principal part of the wealth of the occupiers. No very large or formidable wild animals exist at present in Palestine; the fallow deer, gazelle, wild goat, jackal, fox, and porcupine, are the principal. There are, however, numerous birds, including 2 species of vultures, great quantities of game, and wild fowl; and a great variety of reptiles is met with. (*Mod. Trav.* i. 15, 16.)

Conflicting statements have been put forth with respect to the actual condition of the peasantry. According to Mr. Consul Moore "the fellah, or peasant, in Syria, earns little more than a bare subsistence." But Dr. Bowring, on the other hand, states that "the condition of the labouring classes is, comparatively with that of those in England, easy and good. They feed on mutton at 3 piastres per oke, several times a week; bread daily; sometimes rice pillaus, and always bulgur pillaus (a preparation of wheat, husked and bruised, or half ground); their pillaus are made either with butter, olive or sesame oil; cheese, eggs, olives, various dried fruits, and an abundance of vegetables, beet roots, turnips, and radishes, preserved in brine or vinegar, and cucumbers and capsicums in vinegar, for winter use. Their clothing is not especially coarse; the fine climate permits them to wear light cotton and other similar apparel; and in the short winter they are generally well covered. Their

Lodging is good; generally each family has a separate house, or a set of rooms. Lodging generally in Syria is cheap, comparatively with most other countries. The Mussulmans have few holidays; the Christians have a great many, and their amusements are much of the same sort as the Mussulmans, if any thing, less sober; but, on the whole, none of the classes of the pop. can be taxed with habitual idleness. But it is rare that any of the working classes can lay by sums adequate to enable them to pass the decline of life without labouring. In Syria a great portion of the labour is done by females: they are constantly seen carrying heavy burdens, fetching water, &c.; they bring home timber and brushwood from the forests, and assist much in the cultivation of the fields." (*Rep. on Syria*, 49, 50.) Field labour near Beyrout is paid at from 5 to 6½ piastres (1s. to 1s. 3d.); and artisans, as masons, carpenters, &c., get 14 or 15 piastres (2s. 10d. to 3s. 10d.) a day. The yearly expenditure of one of the labouring classes may average from 12l. to 16l. (*Ibid.*, p. 51.)

The fisheries are unimportant, except that of sponge; which is obtained along all the N. half of the coast; and in a good season, about 3,500 okes are gathered, which are principally sent to Smyrna, Rhodes, Marseilles, &c.

Few of the manufactures for which Syria was anciently renowned, survive at present. In Damascus, there are about 4,000 looms for silk and cotton stuffs, each producing 4 or 5 pieces a week, worth from 80 to 95 piastres each. In Aleppo, nearly 6,000 looms of the same description were at work in 1829; but the number in 1838 had diminished to 1,200, the consumption of rich stuffs having fallen off in favour of cotton goods, for which British twist is employed, and which occupy about 500 looms in that city. About 300 looms are also said to be occupied in the manufacture of gold and silver thread stuffs, and the total produce of the looms of Aleppo is estimated at 250,000 sterling a year. (*Baerling's Rep.*, p. 81.) In good oil years, from 7,000 to 8,000 cantars of soap are made in Aleppo; and perhaps 12,000 cantars at Damascus, Jerusalem, Nablous, and other parts of the country; it is not, however, exported to any great distance. Coarse woollens, glass, earthenware, and leather are among the other chief goods manufactured. Homs, Hama, and Beyrout, are the other principal manufacturing towns. The ancient art of dyeing in purple is lost at Tyre, and Damascus blades have no longer their former reputation. In Palestine, a considerable trade is carried on in the manufacture of crosses, beads, rosaries, and such like trumpery.

**Commerce.**—In remote antiquity, Sidon and Tyre were the principal emporiums of the world: they were succeeded by Damascus, Antioch, Joppa, &c.; and in later times by Paphos, whose grandeur was mainly owing to her situation on the great route of traffic between E. Asia and Europe and W. Asia. But for a lengthened period the commerce of Syria has been comparatively inconsiderable. The internal trade of the country is greatly impeded by the want of good roads; those that exist being mostly mere mule or camel tracks. But, notwithstanding, gum arabic, terebinth, asafetida, opium, &c. are brought from the surrounding countries; galls and barilla from beyond the Euphrates; saffron from Persia and Naxos; hare, fox, and jackal skins; yellow berries and goats' hair from Asia Minor; and these, with cotton, goats' and sheep's wool, silk, tobacco, and other kinds of raw produce, previously specified, form the principal exports. The imports consist chiefly of colonial produce and European manufactures: coffee (W. India), from France, Italy, and England; sugar, from France and Great Britain; pepper, spices, rice, dyeing drugs, cotton manufactures, umbrellas, shirtings, nankeens, imitation shawls, and cotton twist, for the most part from England; iron, tin, sal-ammoniac, woollen cloths, from France and Belgium; silks from France, glass wares from Bohemia, by way of Trieste, &c., are the most important. The caravans from Bagdad, Mosul, and Erzeroun, to Mecca, pass through Syria, bringing galls, indigo, Mocha coffee, buffalo-skins, tumba, gum, Cashmere shawls, and a few Indian manufactures, in return for European manufactures and cochineal; and constant caravans travel between Aleppo and Alutab, &c., bringing oil, grain, and leather for the use of the former, which is by far the most important *dépôt* in the interior of Syria. The progressive increase of the foreign trade after the Egyptian conquest was obvious; and chiefly in favour of the British, at the expense of the French and Sardinian. In 1830, Syria and Palestine received from Great Britain 19,976,500 yards of cotton fabrics, worth 195,770l., and 777,120 lbs. cotton twist, with earthenware, steel, wrought and unwrought, cochineal, indigo, sugar, pepper, pimento, &c. the value of the whole amounting to 261,506l. (*Board of Trade Reports*, 1841.)

The following is an account of the values of the imports into, and the exports from, Syria, in 1835, specifying those from and to each country:—

Imports.		Exports.	
From	Piastres.	To	Piastres.
Austria	1,581,500	Austria	557,700
Egypt	14,684,000	Egypt	12,000,000
France	6,682,000	France	6,525,000
Great Britain	7,261,000	Great Britain	550,000
Greece	124,100	Greece	246,680
Sardinia	5,700	Sardinia	—
Tuscany	4,022,000	Tuscany	5,153,520
Turkey	8,841,100	Turkey	4,677,300
Total	48,210,600	Total	29,270,800

The balance was principally paid in specie, or in European bills of exchange. The slave trade is not carried on to any great extent in Syria.

**Government, &c.**—The immediate influence of the conquest of Mehemet Ali was exhibited not only in the increase of commerce, but in a better system of police, and a better administration of justice, an increase in the value of land and labour, an increase of cultivation, and greater religious toleration. But the rayas, and working classes generally, though better protected, were more burdened and impoverished. They were forced to labour for sums far below the ordinary rate of wages; their camels, cattle &c. were continually seized for the service of the government, and their property and resources, of whatever kind, were subjected to fresh exactions. According to Mr. Werry, nothing was done to improve the means of communication in Syria during the Egyptian ascendancy; few public works having been undertaken, except extensive barracks in the large towns. Neither did the government make public education so much an object of its care as in Egypt. The forced cultivation introduced by Ibrahim Pacha enriched only the government, not the subject. But the short period during which Syria was held by Mehemet Ali, and the uncertainty of his tenure, were sufficient to hinder him, however much disposed, from undertaking or effecting any considerable reforms or changes; though, if we may judge from what he has done in Egypt, his changes, had he been allowed to introduce them, would hardly have been improvements. On the whole, however, we incline to think that, whatever might have been the influence of his government, it would, at all events, have been preferable to the worn-out, extravasated despotism of the Porte.

Under the Egyptians, Syria was divided into 6 districts; those of Aleppo, Damascus, Jaffa, Tripoli, Saïda (Sidon), and Adana. Every town had a *metcassin*, or head police magistrate; and in all having a pop. of above 2,000 persons, *Sciort dîrars*, or town councils, were established by Ibrahim Pacha. These bodies consisted of from a dozen to 20 of the chief inhabitants, without distinction of religion, and acted as a civil and commercial court, the decisions of which were subject to appeal to the divans of Aleppo or Damascus, and finally to the supreme government at Cairo. The courts strictly circumscribed the duties of the *cahi*—not annually from Constantinople to make the judicial tour of Syria. Justice was remarkable for its promptitude and severity. Murder, burglary, highway robbery, and other capital crimes, are, however, comparatively rare in Syria. Europeans are subject to the jurisdiction of their own consulates.

No law exists making provision for the poor, though there are many private Mussulman endowments; and the other religious sects mostly support and relieve their own sick, paupers, &c. In every parish, or mosque district, there are Mohammedan primary schools; and Jewish, Christian, and other primary schools, are established wherever those sects prevail. But the instruction in these is mostly limited to that derived from religious books; and there is no native school in Syria where a more advanced education is given than in reading and writing, with the exception of the Greek college at Beyrout, where geography is studied from books printed at the Protestant presses. The American missionaries have a superior college in that town, and various other schools in the country.

The army maintained by Ibrahim Pacha in Syria was greatly over-rated in amount. Mr. Moore estimates the total number of men at from 45,000 to 50,000; 35,000 infantry, 4,000 artillery, and from 6,000 to 8,000 cavalry, independent of the irregular Bedouin troops. The forces in Syria were, for the most part, Egyptian, the Syrian conscripts being usually sent to Egypt, and replaced by others from thence. The discipline introduced into the Syrian army was copied from that of the French. Ibrahim Pacha had the address to disarm all the civil pop., and attempted to settle some of the Bedouin tribes on the skirts of the Desert. But subsequent events appear to have restored their arms to the former; and the latter, most probably, prowl lawlessly over the country, as heretofore.

The public revenue in 1836, derived from the land, house, cattle, capitation, toleration, &c. taxes, government rents, fines, customs, and other duties, &c., was

supposed to be equivalent to about 696,000*l.*; but the expenditure in the same year was estimated at nearly 1,200,000*l.*, the deficiency having been made up by contributions from Egypt.

The inhabitants of Syria comprise a mixture of different races, consisting partly of the posterity of those who occupied the country when it was overrun by the Arabs, that is, of the Greeks of the lower empire; partly of the posterity of the Arab conquerors of the country; and partly Turks, or Ottomans. And these, again, have been intermixed with each other, with the crusaders, who invaded and held a portion of the country for a considerable period, and with the wandering Bedouins, Kurds, &c. But, how different soever their origin, these races have, in the course of time, become equally naturalised to the country. The inhabs. are generally of a middling stature; those belonging to the southern are more swarthy than those belonging to the northern plains; and these, again, than those belonging to the mountains. On Lebanon, indeed, and in the mountainous districts generally, the complexion does not differ materially from that of the inhabs. of the S. of France. Arabic is the general language of the country; and Volney affirms, in opposition to the statements of Niebuhr, that neither Syriac nor modern Greek is any where in common use.

But notwithstanding the family or national resemblance by which the Syrians are now distinguished, they are distributed into different classes or tribes, all differing from each other in more or fewer particulars. Of these tribes, one of the most famous is that of the Druses, occupying the S. parts of Lebanon and Anti-Lebanon, parts of the Hauran, &c. They are supposed to be of Arabic origin, and to be disciples of a Mohammedan heretic of the 10th century. Their religion, notwithstanding the late researches of Mr. Jowett, Mr. Robinson, and others, still continues involved in a good deal of mystery. According to Volney, they appear to have a contempt for all that the Mohammedans hold most sacred; for, he says, they neither practise circumcision, nor prayer, nor fasting, nor observe festivals nor prohibitions; and that they drink wine, eat pork, and allow of marriage between brothers and sisters, though not between fathers and children. They have an emir of their own, and enjoy a rude independence, to which, no doubt, their "openness, sincerity, and engaging manners" (Clarke, i. 396.) are mainly to be ascribed. They are divided into two great classes, the learned, or initiated (*akout*) and unlearned, uninitiated (*ajahels*). The former, who enjoy various privileges, are distinguished by their white turbans. Robinson says that "the uninitiated perform no religious rite whatever, unless when circumstances oblige them to assume the appearance of missuimien." (II. 11.) They are eminently tolerant; and live on good terms with both Christians and Mohammedans. Mr. Ellis is not very favourable to the Druses. "Outwardly," says he, "they are moral in their deportment; but it is doubted whether similar decorum prevails behind the scenes. Though polygamy is permitted, yet few have more than one wife, who, however, may be divorced at pleasure. They are extremely hospitable; yet, where no breach of hospitality is involved, the rights of blood and friendship are unhesitatingly sacrificed to interest. They have little personal, but much public pride. The women are distinguished by an appendage as strange, unmeaning, and hideous, as female fancy ever devised. Other nations may laugh at the long trains of the ladies of England, the infantine shoes of China, or the monstrous nose-rings of India; but the *tantour* of Lebanon surpasses them all. 'It is a plated, silver, or gilt tube, resembling a straight horn, 18 inches long, and standing out like a unicorn's, at an angle of 45° from the centre of the forehead, or from one side of the head; it is fastened by means of a spring, balanced by 3 heavy tassels hanging down the back, and covered with a white transparent veil.'" (Ellis's Trav., i.)

The Maronites are a Christian sect, principally inhabiting the country about Lebanon, adjacent to the Druses. They originated in the 6th century, and profess themselves to be followers of the monk Maron, whence their name. They effected a union with the church of Rome, from which they had never differed very widely, about 1215. They are divided into the two classes of sheiks or chiefs, and common people, and have a spiritual head, with the title of Patriarch of Antioch. They are all husbandmen; property is sacred amongst them; and, on the whole, they bear a good character. Like the Druses, they have succeeded in maintaining their independence, paying merely a moderate tribute to the pacha. The Metualis, another tribe, are Syrian Mohammedans, of the Shilite, or Persian sect. The Ansarians, Yezidi, Samaritans, &c., have complicated religious systems, partly Mohammedan and partly idolatrous; but for accounts of these and the other Syrian tribes, we beg to refer the reader to *Volney*, which still continues to be the best work on this interesting region.

The ancient history of Palestine is familiar to every reader of the sacred writings. Under Solomon, it became a rich and powerful kingdom; and after undergoing various vicissitudes, it finally became tributary to the Romans. At the period of the advent of the Messiah, it was divided into 5 provs., Judea, Samaria, Galilee, Perea, and Idumea. We have already (art. JERUSALEM) noticed the conquest and destruction of that city by Titus, and the final dispersion of the Jews. In more modern times the Holy Land became the seat of a violent struggle. A singular combination of credulity and superstition gave birth to the crusades; and for some centuries the recovery of the Holy Land, and especially of the Holy Sepulchre, was sufficient to precipitate hundreds upon hundreds of thousands of blood-thirsty fanatics upon the East. At length, after oceans of blood had been spent, the victories of Saladin put an end to this deplorable phrenzy. In 1516, the country was taken by the Turks.

Very recently, or in 1832, Ibrahim, son of Mehmet Ali, pacha of Egypt, undertook and speedily effected the conquest of Syria and Palestine. It is doubtful, as already seen, whether they would have gained any thing by the change; but it would be very difficult, indeed, to show that they could have lost any thing. The great European powers, however, with the exception of France, determined not to permit Syria to be disunited from the Porte; and in 1840, a British fleet, after a short but tremendous cannonade, took Acre, and Ibrahim was compelled to agree to evacuate the province. It does not, however, seem that the states by whom this revolution was effected took any step whatever to ensure the better government of the country in future; to obviate any one of the grievances by which it has been oppressed, or to make any stipulation of any kind in favour of the inhabitants.

In the art. TYRE, the reader will find some notice of the history of Phenicia. (See *Richard's Palestine*; *Bosworth*, &c.; *Rep. on Syria*; *Castell*; *La Syrie*; *Mohamet Ali*; *Marmont*, *Joyce*, &c., ii. iii.; *Russell's Aleppo*; *Volney*, *passim*; *Ellist*, *Wilde*, *Robinson*, *Addison*, &c.; *Mod. Trav.*, i. ii. iii., &c.)

SZEGEDIN, a royal free town of Hungary, co. Csongrad, of which it is the cap., on the Theiss, where it is joined by the Maros, 60 m. W.N.W. Arad, and 100 m. S.E. Pesth. Pop. 32,200. (*Berghaus*.) It consists of the town-proper, tolerably well built, and chiefly inhabited by Germans; the fortress, the residence of a commandant and garrison, connected with the town by two bridges; the upper and lower suburb, and the corn market. It has a house of correction (which, according to the *Aust. Nat. Encyc.*, is the only one in Hungary), a lyceum, gymnasium, Piarist college, military school, &c.; and is the see of a Greek protopapas. *Vogel* says it is one of the most disagreeable towns in Hungary; it has, however, a good deal of trade, chiefly in corn, soda, soap, and tobacco, with several soap and other factories. It also supplies some of the best river craft in the kingdom. (*Berghaus*; *Page's Hungary*, &c., i. 1481.)

## T.

TABRIZ, or TAURIS, a city of Persia, prov. Adzerbijan, of which it is the cap., in a large and fine plain, on a small river which falls into Lake Urmien, 320 m. W.N.W. Teheran, lat. 38° 10' N., long. 46° 37' E. Its pop. was estimated by Chardin at upwards of half a million; but it has declined so much in the interval, that it is now probably under 300,000; and it is said by Mr. Kinnear to be one of the most wretched cities he had seen in Persia. (*Persian Empire*, p. 151.) Being surrounded by a forest of orchards, it appears from the high ground above it to be of immense extent; and a modern traveller considers the circuit of the gardens of Tabriz to measure not less than 30 m. (*Rawlinson in Geog. Journal*, x. 2.) But the town itself, which is nearly in the centre of this area, is only about 3½ m. in circuit; it is surrounded with a brick wall and towers, and is entered by seven gates. It has few public buildings of note: the principal is the citadel of Ali Shah, a part of which is now converted into an arsenal, where many European artisans are or have been employed. A considerable portion of the pop. live in the suburbs, which straggle over the area of the ancient city, and are built of its ruins. Tabriz is said by D'Anville to represent the ancient *Ganzaca*, where Cyrus deposited the treasures of Croesus, and which was afterwards taken by Hecrattus; and it has been also supposed to be identical with the *Tascher* of Ptolemy. But, according to other authorities, it was built under Haroun al Raschid, of whom it was certainly a favourite residence. Its trade, which was formerly extensive, has greatly declined. Few cities have suffered so much from the ravages of war and earthquakes. Its climate is praised by the natives for its salubrity; but the changes of temperature are extremely great and sudden, and in

whiter the cold is so intense, that "many instances have occurred of individuals, accidentally excluded from the city by arriving after the gates were shut, being found frozen to death in the morning." (*Mod. Trav.*, xiii. 256-258; *Kinncir's Persian Empire*, &c.)

TADCASTER, a market town and par. of England, W. Riding, co. York, partly in the liberty of St. Peter of York, and partly in Barkstone-Ash wapent., on the Wharf, here crossed by a stone bridge; 10 m. W.S.W. York. Area of par., 6,100 acres. Pop. of do., in 1831, 2,855. The town is well built. The church, which is handsome, in the perpendicular style, has a fine tower. (*Rickman's Gothic Architecture*.) The living, a vicarage in the gift of Lord Egremont, is worth 240*l.* a year. It has chapels for Methodists and other dissenters, Jesus' hospital for four poor men, a free grammar school, founded in the time of Queen Elizabeth, Sunday schools, for some of which spacious buildings have been erected, &c. There are no manufactures, but a good deal of retail trade. Markets on Thursdays, fairs, last Wednesday in April, May, and Oct., for sheep and cattle.

TAGANROG, a fortified sea-port town of Russia in Europe, on the N. shore of the N.E. angle of the sea of Azoff, denominated the gulph of the Don, about 10 m. from the mouth of that river; lat. 47° 12' 48" N., long. 39° 3' E. Pop. about 18,000. The foundations of Taganrog were laid by Peter the Great in 1698; but it afterwards fell into the possession of the Turks; and it was not till the reign of Catharine II. that it became of any considerable importance. It has ten churches, of which three are built of stone; a gymnasium, a poor's hospital, &c. It was intended by its illustrious founder to be a place Azoff, the ancient emporium of the Don, the port of which had become all but inaccessible; and its whole consequence is derived from this circumstance, or from its being the entrepôt of the commerce of the vast countries traversed by that great river. The exports consist principally of corn, particularly wheat; iron and hardware from Tula; with cordage, linen, and sail cloth, copper, tallow, wool, leather, furs, wax, ashes, caviar, isinglass, &c. The imports consist principally of wine, oil, fruit, dysaleries, cotton and woollen goods, spices, dye stuffs, tobacco, sugar, coffee, &c. The largest portion by far of the trade is carried on with Constantinople, Smyrna, and other Turkish ports; but a good deal is also carried on with the Italian and other foreign ports; and there is an extensive coasting trade with Odessa and other Russian ports. In 1836 the total value of the exports from Taganrog to foreign ports amounted to 7,422,277 roubles, and that of the imports to 7,864,118 do., the value of the exports to Russian ports amounting, during the same year, to 3,080,523 roubles, and that of the imports to 1,821,233 do.

Seeing that Taganrog was built to obviate the difficulties that had been encountered, by vessels entering the Don, through the shallowness of the water, it might have been supposed that care would be taken to place it in a position in which it should be, in as far as possible, free from this defect. This important consideration seems, however, to have been in a great measure overlooked. The gulph of the Don is seldom navigable by vessels drawing more than from 8 to 9 ft. water, and even these cannot approach within less than about 700 yards of the town. They are principally loaded by carts, drawn each by a single horse, the expenses being so very considerable that it costs from 120 to 150 copecks to ship a chetwert of wheat.

To obviate these inconveniences it has been proposed to make Kertsch, on the E. coast of the strait of Yenikali, a dépôt for the produce of the sea of Azoff; and while the latter would be much easier of access to foreign ships, the coasters that at present bring down the products of the basin of the Don from Nakhitchevan and Rostoff to Taganrog, would be able to bring them direct to Kertsch, where they might be landed and shipped with much greater facility, and less expense. In 1836, 761 vessels arrived at, and 730 sailed from, Taganrog; but owing to the shallowness of the water they were chiefly of small burden. With the exception of a few foreign houses, the merchants are mostly all either Greeks, or of Greek origin, and are not wealthy.

The emperor Alexander, whose reign will always form a memorable and brilliant era in the history of Russia, expired at Taganrog on the 19th of November, 1825. (For further particulars see *Schmitzer, La Russie*, p. 171; *Hagemeister on the Trade of the Black Sea*, p. 31, &c.; and *Russian Official Accounts*.)

TAGUS (Span. *Tajo*, Portug. *Tejo*), the principal and best celebrated river of the Span. peninsula, through the centre of which it flows from E. to W., between the basins of the Ebro and Douro on the N., and the Guadiana on the S. It has its source in the Sierra Albaracin, on the borders of Aragon and New Castile, about lat. 40° 25' N., long. 1° 55' W., 30 m. W. Teruel, and only 90 m. from the Mediterranean. At first it runs N.W., but after having been joined by the Molina, its course is generally W. or S.W., through New Castile

and Estremadura, in Spain; and in Portugal between Beira and Alemtejo, and through Estremadura to the Atlantic, which it enters after expanding into a wide estuary, about 7 m. below Lisbon. Its entire length may be estimated at nearly 600 m., about 3-4ths of which are in Spain. Its principal tributaries are the Jarama, Alberche, Alagón, and Zezere from the N., and the Río del Monte, Salor, Sora, &c., from the S. Aranjuez, Toledo, Talavera, Almaraz, Alcantara, Abrantes, Punheto, Santarem, and Lisbon, are on its banks. At its entrance into Portugal, the Tagus is 130 yards in width, and at Punheto upwards of 300 yards. Above Lisbon, it expands into a wide basin, from 2 m. to 7 m. across; but opposite that city its breadth contracts to less than 2 m. The Tagus has been celebrated, both in antiquity and in modern times, for its picturesque beauty: nothing, however, can be more incorrect than these poetical descriptions. It flows, in fact, for the most part, through an arid country, bare of wood, and uncultivated; its banks are generally steep, its current impetuous, and its waters turbulent and muddy. It was famous in antiquity for its golden sands: *Tagus auriferis arenis celebratur*. (*Plin. Hist. Nat.*, lib. iv. cap. 22, see, also, *Silius Italicus*, lib. vii. v. 755; *Ovidii Metamorph.*, lib. ii. v. 251, &c.) At present, however, very few particles of gold are ever found in the sands of the river; and though they may have been more abundant in antiquity, the fair presumption seems to be, that it is indebted for its celebrity, in this respect, rather to the yellow colour of its sands than to its gold.

Hitherto the Tagus above Lisbon has not been of much commercial importance, though it be navigable as high as Abrantes. Attempts have, however, been made to render it navigable from Toledo, and even Aranjuez; and no doubt, should the present liberal government maintain its footing in Spain, this will be effected. Inglis says, that in the winter of 1820, the passage downwards to the sea was successfully undertaken by boat from Toledo. But, he adds, "this could not have been done at any other season; because, in dry weather, the water is in many places almost wholly diverted from its natural channel, for the use of the mills that have been erected upon its banks." (*Inglis's Spain*, i. 297; *Milano Dictionario*, &c.; *Cellarii Geographia Antiqua*, i. 68. &c.)

TAIN, a royal and parl. bor. of Scotland, co. Ross, on rising ground, near the S. shore of the Frith of Dornoch, and near the mouth of the river Tain, 24 m. N.N.E. Inverness. Pop. of parl. bor., in 1841, 1867. "Tain has improved of late years, and may be considered in a thriving condition. Many new houses have been built, and a good deal of ground has been fenced. It possesses a good academy (founded in 1806), which has attracted a number of families to the town for the education of their children; but it has little or no manufacture, and the sand-bars on the coast deprive it of any advantage it might have derived from its maritime situation. A new entrance into the town, from the S., is contemplated." (*Parl. Bound. Report*.) It has a handsome par. church, erected in 1815, a grammar school, and three branch banks. It is associated with Cromarty, Dingwall, Dornoch, and Kirkwall in sending 1 mem. to the H. of C. Registered electors, in 1839-40, 86. It is governed by a provost, 2 bailies, and 12 councillors. Corporation revenue, in 1840, 296*l.*

TALAVERA DE LA REYNA, a city of Spain, New Castile, prov. Toledo, on the Tagus, 42 m. W. by N. Toledo, and 65 m. S.W. Madrid. Pop. about 8,000. It stands in a large and fertile plain, and is divided into two parts by the river, which is here crossed by a stone bridge of 35 arches, and 530 yds. in length. The remnants of old fortifications exist, but the town cannot, at present, be said to be fortified. "The modern town is very irregularly built, with low houses, and narrow and ill-paved streets: it has 8 par. churches, 8 monasteries, and 5 nunneries, which appear to have nothing about them remarkable, (except, perhaps, the collegiate church, in which Mirano says there is a good picture of the Assumption). There are two handsome *almedas*, or public promenades, which are but little frequented, the inhabs. being as generally sunk in apathy and sloth as in the days of their townsman Mariano." (*Mod. Trav.* xix. 221.) Talavera has an economical society, schools of Latin, philosophy, theology, &c., and had formerly some manufactures of silk, stuffs, and porcelain. Its markets are tolerably well supplied with provisions. It is supposed to represent the *Talabrica* of the Romans: it was taken by the Moors in 714, and various Moorish remains are still to be seen in the city and its neighbourhood. After many vicissitudes it was destroyed by the Moors in 1106, but was speedily rebuilt. It afterwards became an appanage of the queens of Spain, whence its name.

In modern times it has been rendered famous by the obstinate battle fought in its neighbourhood, on the 27th and 28th of July, 1809, between the British and Spanish forces under Sir Arthur Wellesley (now Duke of Wellington), and the French under Joseph Buonaparte,

assisted by Marshals Jourdan and Victor. The French, who commenced the attack, were repulsed at all points. The slaughter was great, and nearly equal on both sides. (*Mariano; Napier's Peninsular War*, ii. 393, &c.)

**TAMBOFF**, a central government of European Russia, principally between the 52d and 53th degs. of N. lat., and the 40th and 43d of E. long., having N. Vladimir and Nijni-Novgorod, E. Preussa and Saratov, S. Voronege, and W. chiefly the latter and Riaizan. Its length N. to S. is about 350 m., breadth varying from 100 to 250 m. Area, 24,420 sq. m. Pop. in 1838, 1,501,700. Surface flat, except in a few parts, where it is slightly undulating. Principal rivers, the Tsna and Mocksha, tributaries of the Oka, flowing N.; and the Vorona, a tributary of the Don, flowing S. In the N. the soil is sandy and marshy; a large proportion of the country, principally the marshes, being covered with forests; in the E., or *steppe*, so called from its being bare of wood, the soil consists principally of a black mould, and is comparatively fertile. The government comprises in all 5,912,222 deciatines (a deciatine = 27 Eng. acres), which, according to the notice published in 1833, by M. Korsakoff, formerly vice governor of Tamboff, were distributed as follow:—

	Deciatines.
Cultivated and cultivable lands	2,296,177
Meadows and pasture grounds	1,453,588
Forests of the crown	153,768
— individuals	81,653
Towns and villages with their dependencies	95,197
Communal properties	726,719
Roads, marshes, and waste lands	315,276
Total	5,912,222

Corn is the principal product; but, according to the official accounts, the crops are extremely variable, and scarcities frequently occur. The crop of 1802, for example, was estimated at 9,224,827 chetwerts, and that of 1821 at only 5,223,795 chet. (a chetwert = 6 bushels nearly). In 1832, an abundant year, 800,000 chetwerts were exported to Moscow and Petersburg. We should not have thought it worth while to be so particular in these notices, but for the fact of its having been stated, in a consular return from Petersburg, that in 1835 no fewer than 34,000,000 quarters of corn were produced in this government! That any public officer should have made such a statement, and that the Foreign Office should have printed it without note or comment of any kind, is, if not a singular, at all events rather a remarkable circumstance. It may be affirmed, with the utmost confidence, that the entire produce of this government never amounted to 12 million quarters, either in 1835 or any other year. We have already seen that the cultivated and cultivable lands in the government amount to about 2,226,000 deciatines, or to very near 6,000,000 acres. Now, supposing this land to be *all* in cultivation (which it is not), the invariable practice here is to take two crops and then fallow, so that a third part of the land is constantly waste, leaving 4 millions of acres under crop. If each acre produced, at an average, 3 quarters, the total produce would be 12 million quarters; but when we bear in mind the backward state of agriculture, and the poverty of the soil in the N. half of the government, where the return is said not to exceed 3 or 4 times the seed, it will be immediately seen that if we estimate the entire produce in ordinary years at 9,000,000 quarters, we shall most probably be a good deal beyond rather than within the mark. It is to be observed, too, that by far the larger portion of the produce is rye, wheat not constituting above one fifth part of the total produce; and we may further observe, that it would cost from 15s. to 20s. to convey a quarter of this wheat either to Petersburg or to a ship in the roads off Taganrog, in the sea of Azoff. The peasantry are well treated, and in good circumstances. Hemp is extensively grown; the value of the quantity exported amounting, according to Schnitzler, to 1,000,000 roubles a year.

The forests along the Mocksha supply a good deal of timber for ship and boat building; and the inhabitants are there principally wood-cutters, carpenters, coopers, or pitch and tar makers. Cattle, principally brought from the steppes of the Don, the Volga, and the Caucasus, are numerous, and are extensively fattened for the neighbouring governments, and for Moscow and Petersburg. In 1832 the stock of sheep was estimated at 1,000,000 head, and 670,000 hogs. The horses belonging to the gentry are good, and have been much improved by the stud kept by the Orloff family; but the horses of the peasantry are wretched. The manufacture of woollen cloth is carried on to a considerable extent. Peter the Great established an extensive cloth manufactory, for the service of government, at the village of Boudari. This, however, was burnt down in 1836; but having been since rebuilt on a great scale, it now (1842) gives employment to about 2,000 males, and 1,150 females: the consumption of wool is stated at 50,000 pounds a year; and besides furnishing 440,000 arschines of cloth annually for the army, it pro-

duces other goods, worth 1,500,000 roubles. It has also numerous forges, distilleries, tallow factories, mills (of which a very few are belongs to Count Koutalskoff), &c. Principal towns, Tamboff, Morchansk, Chutok, Zlatost, Lipetsk, &c. (See *Schnitzler, La Russie*, p. 361; *Possart das Kaiserth Russland*, p. 563; *Vcnables' Russia*, p. 333, &c.)

**TAMBOFF**, a town of Russia in Europe, cap. of the above gov., about the centre of which it is situated, on the Tsna, 385 m. S.E. Moscow; lat. 52° 43' 12" N., long. 41° 45' 15" E. Pop., in 1830, according to an official statement, 20,147. The town, which is about 2 m. in length, by 1 m. in breadth, was originally founded and fortified in 1636 as a defence against the incursions of the Nogai Tartars. The houses are principally of wood; but there are various stone churches, a large monastery, gymnasium, civil hospital, a military orphan asylum, &c. In the school of cadets at Tamboff, about 100 pupils, sons of nobles, are instructed in French, German, military exercises, &c.; and the most intelligent are afterwards sent to the *corps de cadets* at Petersburg. A high school for young ladies was founded in 1834, and there are various other schools. Manufactures of woollen cloths, alum, vitriol, &c. are established; and the town has active general trade.

**TAME**, a river of England. See **THAMES**.

**TAMWORTH**, a par. and munic. bor., market town, and par. of England, principally in the co. Stafford, but partly also in Warwickshire, being divided into two parts by the Tame, where it is joined by the Anker, 64 m. S.E. Lichfield. Area of par. bor., which the Boundary Act made co-extensive with the par., 12,920 acres. Pop. of do., in 1831, 7,182. The town is well built, and a handsome bridge is thrown across each of the rivers. According to the *Monie, Bonnd. Rep.*, the pop. of both the bor. and par. appeared, at the time (1837), to be stationary, or decreasing rather than otherwise. This may be attributed in some measure to the decay of the staple manufacture of the place, and to the breaking up of the large establishment of the late Sir R. Peel. The town was not then lighted; but the inhabitants were about to assess themselves under the general act for that purpose. The gas works were nearly completed, and it is now well lighted. It is paved at the expense of the corporation. The par. church, dedicated to St. Editha, is supposed to occupy the site of a very ancient nunnery.

It is a large, handsome edifice, with a fine tower, and a crypt under part of the church. Some portions are of decorated date, and some perpendicular, and both good; some of the windows have had very fine tracery. In the tower is a curious double staircase. *Richman's Cath. Arch.* Numerous monuments adorn the interior of this church. The living, a perpetual curacy, worth 470l. a year, is in the gift of — Resington, Esq. There are various dissenting chapels, an hospital for 14 poor men and women, founded and endowed by Thomas Guy, the founder of the famous hospital in Southwark which bears his name; a grammar school, which received endowments both from Edward VI. and Elizabeth. Very recently a free-school has been established by the present Sir Robert Peel, and there are other schools. Boys from the grammar school are eligible to a scholarship in Catherine Hall, Cambridge, and a native of the town to a fellowship in St. John's College, Cambridge. On an artificial height, near the town, is Tamworth Castle, a seat of the Townshend family. This castle, though now much modernised, is of great antiquity, having, according to some authorities, been founded by Etheldreda, daughter of Alfred. It was conferred, with the town of Tamworth, by William the Conqueror, on Robert de Marnion, Lord of Fontenay in Normandy, the exploits of one of whose supposed descendants have been immortalised in the best of Scott's poems.

Calico-printing, and the manufacture of superfine narrow woollen cloths, were the chief branches of industry at Tamworth; but of late years they have materially declined.

Tamworth, which is on the line of the Roman Watling Street, was a place of much consequence, and the favourite residence of the Mercian kings during the Heptarchy. It appears to have been a borough by prescription; but was re-incorporated by Elizabeth. The municipal borough, which is much less extensive than the parliamentary borough, is governed by 4 aldermen and 12 councillors; it has no commission of the peace, though quarter sessions for civil causes are held. Poor-revenue, in 1840, 377l. 7s. 8d. The Commissioners of Inquiry into the municipal affairs of the different bor., speak highly of the past government of Tamworth. "The governing body is wholly self-elected; it does not appear, however, that the power thus vested in the body has been in any respect abused. Neither does it appear that the corporation, either as regards the appointment of members to the body corporate, or the exercise of the elective franchise, have been subject to the operation of any undue local influence. The ab-

sence of all complaint leads to the conclusion that the objects of municipal government have been satisfactorily attained in this borough; that the governing body has been judiciously selected, justice well administered, and the revenues carefully applied to public purposes." Tanworth has sent 2 mems. to the H. of C. since the 5th of Elizabeth. Previously to the Reform Act, the right of voting was in the inhabitants paying scot and lot. Reg. electors, in 1839 40, 561. The present distinguished parliamentary leader, Sir Robert Peel, Bart., has represented Tanworth for a lengthened period, and has been one of its greatest benefactors. His seat, Drayton Manor, is about 1 m. S. the town. (*Mun. Corp. and Bound. Repts. Appendix, &c.*)

TANJORE, a distr. of Hindostan, presid. Madras, and one of the most valuable in British India, ranking in point of cultivation and productiveness next to Burdwan in Bengal. It lies principally between lat. 10° and 11° 30', and the 79th and 80th degs. of E. long., having the distr. of Trichinopoly, &c., Madras, and the ocean on the S. and E. Area, 5,625 sq. m. Pop., in 1831, 1,128,730. About half the prov. is a flat alluvial delta formed and completely irrigated by numerous branches of the Coleroon, which constitutes the N. boundary. This delta is justly considered the granary of the Madras territories; almost the whole of it is cultivated with rice, which is here produced in larger quantities and with more certainty than in any other distr. on the E. coast. The average gross produce in rice (not paddy) yearly, is estimated at 58,046 *garce*. (*Madras New Almanac*, 1839.) The rest of the distr. S. of the delta is on a considerably higher level; its surface is undulating, and it comprises many varieties of soil.

Tanjore was formerly assessed under the ryot-war system, but this was afterwards abandoned for the village settlement, under which last both the revenue and cultivation have increased very considerably. (*Cotton, in Rep.* 1832.) The district is famous for its excellent roads.

The pop. is for the most part Hindoo, and chiefly agricultural; but there are some manufactures of cotton and silk stuffs, of copper utensils at Combocoom, Maargooda, &c. These, however, have declined greatly of late years, owing to the importation of cheaper English goods, though some manufactured articles are still exported with the agricultural produce to Bengal, Achin, Tranquebar, and the adjacent districts. The imports are iron, saltpetre, dry grain, oil, glue, wax, tamarinds, &c. from Comblatore, Salem, Trichinopoly, &c. The trade of Tanjore is very considerable: in 1837-38 the value of the exports was estimated at 2,619,259 rup. Total public revenue in the same year, 4,738,697 rup.; expenditure, 5,261,677 rup.; so that in a pecuniary point of view it is a very valuable possession.

Tanjore was never permanently conquered by the Mohammedans, and Hindoo institutions and edifices have been preserved in it in much purity and perfection. In almost every village there is a pagoda, with a lofty gateway of massive though not elegant architecture, in which sundry Brahmans are maintained; and on all the great roads leading to these places are choultrys for the accommodation of pilgrims. The district has been noted for the prevalence of *suttees*. In antiquity it constituted the principality of Chola, whence the whole coast afterwards acquired the name of Coromandel. It was conquered by the Mahrattas in 1675; but we came quietly into its possession in 1739, on condition of allowing the rajah a lac of star pagodas and a fifth part of its nett revenue annually. (*Madras Almanac* for 1838; *Hamilton; and Parl. Repts.*)

TANJORE, a large city of Hindostan, cap. of the above distr., in a plain S. of the Coleroon, and 170 m. S.E. Madras. Lat. 10° 45' N., long. 79° 12' E. Its pop. is not stated, but is probably from 35,000 to 40,000. It is said to be nearly 6 m. in circ., and consists of two separate portions, both fortified; one comprising the palace and other public buildings; and the other a celebrated pagoda, perhaps the finest specimen in India of a pyramidal temple. Its grand tower is 139 ft. in height, and is remarkable for its simplicity. In a covered area in this temple is a bull carved in black granite, 16 ft. in length, by 12½ ft. in height, deemed one of the best works of Hindoo art. Close to the temple stands an English church. According to Hamilton, Tanjore appears to have been pretty strongly fortified; and the city is more regularly built, and has a larger proportion of solid and ornamental edifices than any other native town S. of the Krishna. In the palace is a group of the late rajah and his tutor, the Danish missionary Schwartz, executed at the desire of the rajah by Flaxman. The British residency is outside the walls to the S. Tanjore was unsuccessfully besieged by the British in 1749, and the French in 1758; but was taken by the former in 1773. (*Hamilton; Heber, in Mod. Trav., &c.*)

TAORMINA (an. *Taurominium*, or *Tauromenium*), a town of Sicily, prov. Messina, cap. cant., on a high, craggy mountain, on the E. coast of the island, about

half-way between Messina and Catania, being 30 m. S.W. the former, and 31 m. N.E. the latter. Pop., in 1831, 3,929. Travellers speak in the highest terms of the surrounding scenery. "Were I," says Swinburne, "to name a place that possesses every grand and beautiful qualification for forming a picture—a place on which I should wish to employ the powers of a Salvator or a Ponsini, Taormina should be the object of my choice. Every thing belonging to it is in a large, sublime style." It is fortified by an irregular wall and lines, constructed by the Saracens, surmounted by an old Saracenic castle and more modern works; and above all, on the summit of a tabled cliff, is the inconsiderable town and military post of Mola. Though Taormina has an immoderate proportion of convents and large buildings, it is ill built and dirty, and, notwithstanding its elevated situation, it is said to be but indifferently healthy. (*Smyth*.) On a fountain, in the main street, part of the statue of a centaur, with the addition of a copper nimbus, is held to represent St. Pancras, a native of the town, and its protector!

Taormina has some splendid remains of antiquity. Its theatre, which is most probably of Greek origin, is the object of universal admiration. It is of very ample dimensions, being capable of accommodating no fewer than 40,000 spectators (*Smyth*), and is wonderfully well preserved. It is principally excavated in the slope of the mountain, its seats being hewn out of the rock: the *proscenium* and parts connected with the stage are built of brick, and are nearly entire; the space allotted to the orchestra is also preserved, as well as the dressing-rooms of the actors. Its greatest breadth (measured on the plan in *Russell's Sicily*) is about 360 ft.; its extreme length, 300 ft.; and it is so admirably contrived that, even now, the slightest noise, as the tearing of a piece of paper on the stage, is distinctly heard in the most distant part of the theatre. The seats command the most noble views of Mount Etna, Aci Reale, Catania, and it is said, of the country even as far as Syracuse. "The spot," says Sir R. C. Hoare, "seems to have been created for a public edifice, behind and before are steep precipices, which leave just room sufficient to place this most noble and magnificent structure. I visited it frequently, and never left it without regret." (ii. 193.) In addition to the theatre, Taormina has an entire side of a naumachia, upwards of 350 ft. in length, with the remains of the aqueduct and the reservoirs that supplied it with water; and in every direction round the town are sepulchres, crotaphs, tessellated pavements, remains of remarkable edifices, &c., attesting its ancient wealth and magnificence. The churches have little remarkable, though that of St. Pancras appeared to Sir R. C. Hoare to be of Grecian origin, and probably, he says, the oldest building in the town. The Dominican convent has a large court, surrounded with columns of fine brown and white marble. The inhabs. have some trade in wines and hemp, the former being, it is said, of superior quality, though very inferior to what they must have been in antiquity, when they occupied a high place at the Roman banquets.

Taurominium is of uncertain origin: it was taken by Dionysius the Elder, in the 94th Olympiad, or about anno 403 b.c. A Roman colony was settled in it by Julius Caesar. The ancient city was ruined by the Saracens in 968; since which it has never recovered any considerable portion of its ancient importance. (*Smyth's Sicily*, p. 128, 129; *Russell*, p. 241—248; *Sir R. C. Hoare's Class. Tour*, p. 194—200; *Swinburne*; *Byron*, &c.)

TARANTO (an. *Tarentum*), a famous city and seaport of S. Italy, kingd. of Naples, cap. of the prov. Otranto, anciently one of the wealthiest and most celebrated cities of Magna Græcia, near the N. extremity of the Gulph of Taranto, 42 m. W. S.W. Brindisi, and 160 m. E.S.E. Naples. Lat. 40° 28' N.; long. 17° 35' E. Pop. estimated by Burgess and others at 18,000. It stands on what was formerly an isthmus, but is now an island, separating the gulph, or outer sea, from an inner bay, called the Little Sea (*Mare Piccolo*), 15 or 16 m. in circ. At its N. extremity is the old channel, leading to the Mare Piccolo, crossed by a bridge about 160 yards in length, over which an aqueduct is brought, conveying water to the city from the mountains of Mutina, about 12 m. distant. The channel on the S. side of the town is artificial, having been originally opened by Ferdinand I., and deepened by Philip II.; it is also crossed by a bridge about 50 yards in length. In antiquity the citadel occupied the site of the modern city.

The harbour of Taranto is excellent, and might, with little difficulty, be made all but perfect. In antiquity the Mare Piccolo, or inner bay, was the principal rendezvous of the Tarentine ships, where they lay perfectly secure from hostile attacks, and as safe in other respects as if they had been in dock. The entrance to the inner bay is now, however, so choked up with rubbish, that it is accessible only to small boats; but it might be easily cleared out, and the basin rendered as useful as ever. Adjoining the town, the Mare Piccolo has from 4 to 6

fathoms water. The présent, or outer harbour, is at once extensive and safe. There are 4 fathoms water close to the town; and the bay, which is capacious, is protected by the islands of St. Peter and St. Paul.

Its situation is striking and singular, and despite the change in its fortunes, Swinburne says its appearance is replete with wonderful beauties. The ancient city extended along the shores both of the gulph and the Mare Piccolo, and the walls which ran from the one to the other formed the base of the triangular space which it covered. Of its magnificent buildings, which included a temple of Neptune, the guardian deity of the city, scarcely any vestiges exist, except the outlines of an amphitheatre, some substructions of apparently a Roman work, and an immense mass composed of fragments of pottery. "The shape of the modern city has been, with some justice, assimilated to a ship, being wide in the centre, and tapering at each end. The principal street runs from one of its extremities to the other in a waving line; and narrow and tortuous communications lead to two other parallel streets; one of which extends along the waters of the outward gulph, but considerably above their level, and is defended from their fury by a parapet wall and projecting battery. Here the best houses are situated. The Marina, on the contrary, which borders the inner bay, or Mare Piccolo, is scarcely raised above its surface; and nothing can present a stronger contrast than the crowded, filthy, but lively appearance of the last, opposed to the quiet, clean, but deserted aspect of the former. The Marina is inhabited entirely by fishermen and their families, who constitute more than half the pop. of the place." (*Craven, Tour*, p. 176.) The cathedral, dedicated to San Cataldo, a native of Ireland, is richly adorned within, and has a silver statue of its patron saint, some ancient columns, inland work in *pietre dure*, &c. Taranto has a formidable looking castle commanding its harbour, numerous convents, a diocesan seminary, two hospitals, an orphan asylum, and manufactures of linen and cotton fabrics, velvets, &c. The great articles of commerce are oil and shell-fish. The taste for the latter is said to prevail at Taranto in a greater degree than in any other part of the kingdom; and when Craven visited the city, the governor drew a revenue from this branch of trade of about 24,000 ducats a year. Swinburne speaks of having partaken at a single meal of 15 different sorts of shell-fish. (*Trav.*, i. 237.) The neighbourhood was anciently famous for the *murice* and *purpura*, but these have been superseded by mussels, oysters, &c., which are reared in immense numbers in the Mare Piccolo.

Tarentum was either originally founded, or, as is most probable, occupied by a colony from Sparta, about anno 700 B.C. The colonists, influenced, no doubt, by the advantageous situation of their new country for a seat of commerce and commercial navigation, became in no very lengthened period distinguished for their proficiency in these departments of industry, and their city is admitted to have been the greatest emporium of S. Italy, or Magna Græcia. *Tarentum Lacædæmoniorum opus, Calabria quondam, et Apulia, totiusque Lucania caput, cum magnitudine et muris portuque nobilis, tum mirabilis situs: quippe in ipsis Adriatici maris faucibus posita, in omnes terras, Istriam, Illyricum, Epirum, Achajam, Africam, Siciliam vela dimittit.* (Florus, lib. i. cap. 18.) Polybius also has ably stated the commercial advantages enjoyed by Tarentum. (Lib. x. Frag. 1.)

The history of this great city is very imperfectly known. Her government, like that of most other Greek states, was different at different periods, being sometimes administered by kings or tyrants, and sometimes by the people. She was distinguished not only by her wealth and commerce, but by the splendour of her public buildings and works of art. She also became a favourite seat of literature and science, and the followers of Pythagoras, though proscribed in other parts of Italy, found here a safe asylum. The famous philosopher Archytas, a disciple of Pythagoras, was repeatedly placed by the suffrages of his fellow-citizens at the head of the government; and showed, by his judicious conduct in civil affairs, and as leader of the armies of the republic, that he was no less eminent as an administrator and a general, than as a moralist, a mechanist, and a geometer. (*Bruckner, Hist. Philosoph.*, i. 1118.; see, also, *Horace's Ode to Archytas*, lib. i. ode 28.)

The refinement produced by the accumulation of wealth and the culture of literature and the fine arts, has been supposed by most ancient writers, and by their copyists in modern times, to have had a most injurious influence over the martial virtues of the Tarentines, and to have occasioned an all but universal degeneracy and corruption of manners. There does not, however, appear to be any real ground for such imputations. When the progress of Rome towards universal dominion brought her armies and fleets into the territories and seas adjoining Tarentum, the latter did not seek to purchase a treacherous truce, by submitting to the dictates of the Roman generals. On the contrary, she made every

effort to maintain her independence; and as she knew that her own forces were inadequate for such a struggle, she wisely sought assistance from others; and it was at her instigation that Pyrrhus invaded Italy. After the departure of Pyrrhus, Tarentum attached herself to the party of Hannibal; and it was not owing to any deficiency of bravery, but to treachery, that Fabius ultimately obtained possession of the city.

The conduct of the Romans on this was consistent with their behaviour on every similar occasion. The city was delivered up to military execution; and such of the inhabitants, amounting to about 30,000, as had escaped the massacre, were sold for slaves. (*Livius*, lib. xxvii. caps 13—16.; *Plutarch's Life of Fabius*, &c.)

Tarentum never fully recovered from this dreadful blow; though, notwithstanding the preference shown by the Romans for Brundisium, she had again become, in Strabo's time, a considerable city. A little to the N.E. of Tarentum, near the Galesus, were situated the fertile valley and ridge of Aulon, the beauties of which have been described in such glowing terms by Horace. (Lib. ii. od. 6.) In addition to the authorities referred to above, see also *Ancient Universal History*, xii. 146, and 308, 800. id.)

TARARE, a manufacturing town of the S. of France, dep. Rhone, cap. cant., in a narrow valley on the road from Paris to Lyons, 20 m. N.W. the latter. Pop., in 1836, 5,990; or, *hic. comm.*, 7,762. It is the centre of a manufacture of plain and figured muslins, which, within a circle of from 10 to 20 leagues of mountainous country, employs wholly or in part at least 50,000 hands, about 20,000 being adult handloom weavers, from 15,000 to 16,000 women and children employed subsidiary to those, from 4,000 to 5,000 employed as agents or otherwise by the manufacturers, the rest, chiefly females, being occupied in embroidering or figuring the plain goods. Most of the weavers, &c. work at their own looms, and the manufacturers do not generally carry on business on a large scale, or employ many hands. There is one tactory, however, (that of the Messrs. Macculloch from Glasgow,) in which from 160 to 200 hands are employed, and goods are produced which are said to be fully equal to those of Glasgow, though we are not disposed to place implicit confidence in this statement. "A portion of the weavers in the country get from 75 cents, to 1 fr. a day; those of the town from 2 fr. to 2 fr. 50 c. and sometimes 3 fr., according to their skill. The manufacturer furnishes only the reed and the upper mounting, all the rest being at the expense of the workmen. Those who are in the town weave all the year round, whereas those in the country do not weave for more than seven months a year, the remaining five months being occupied in agricultural employment." (*Handloom Weavers' Rep.*, i. 124.)

The Tarare weavers are pretty well lodged, fed, and clothed; and Villermé relates, *Je ne connais aucune fabrique en France où les tisserands n'aient paru avoir des mœurs et des habitudes meilleures, aucune ville manufacturière qui n'ait offert moins d'invivens et moins de libertins que Tarare.* (Tableau des Ouvriers, &c. i. 188.)

TARASCON, a town of France, dep. Bouches-du-Rhone, cap. cant., on the Rhone, opposite Beaune, with which it communicates by a new suspension-bridge, 13 m. E. by S. Nîmes. Pop., in 1836, 9,220. It is surrounded with walls flanked by towers, and is commanded by a castle on a rock overhauling the river, built in the 13th century, and formerly the residence of the Counts of Provence. The streets are wide and regular, and one of the principal is lined with arcades. The par. church, a fine Gothic edifice of the 12th century, has a richly sculptured entrance, and a subterranean chapel, in which is a marble statue of St. Martha. Tarascon has a public library, a theatre, town-hall, court of justice, two hospitals, barracks, &c.; and in the neighbourhood is a very extensive nursery called the *Pépinière de Tondule*. It has, also, manufactures of silk and woollen stuffs, some trade in boat-building, and in wine, brandy, and oil. (*Itogo*, art. *Bouches-du-Rhone*; *Guide du Voyageur*, &c.)

TARBES (an. *Bigorra*, post *Tarnia*), a town of France, dep. Hautes Pyrénées, of which it is the cap., in a fine plain, on the Adour, here crossed by a stone bridge of 6 arches, 24 m. E. by S. Pau. Pop., in 1836, 12,500. It is one of the best built and cleanest towns of the S. of France. Its houses, constructed chiefly of marble, stone, or brick, and roofed with slate, have usually gardens attached, of considerable size. A wide main street, containing numerous inns and cafés, runs through the centre of the town, which is also divided into three nearly equal portions, by two large open spaces; one, the *Place de Maubourguet*, being planted with trees, and forming a favourite promenade. The streets crossing the main thoroughfare are almost equally wide and regular, and nearly all lead into suburbs, of which there are 3, surrounding the town on every side. Every quarter of Tarbes is well supplied with water from

the river. There are few public edifices worth notice. The most so is the prefecture, formerly the bishop's palace, a building of different dates, but with an imposing general effect. The cathedral is on the site, and, it is said, consists of a portion of the ancient fortress of *Bigorra*; it is internally adorned with some columns of Italian *breccia*. The old castle of the counts of Tarbes now serves for the prison. The college and theatre are handsome. Tarbes is a bishop's see, the seat of tribunals of primary jurisdiction and commerce, a forest board, &c., and has schools of design and architecture, a royal *dépot d'art*, and some manufactures, principally of copper, iron, and other metals. It is the great commercial *entrepôt* for the country immediately N. of the Pyrenees, and has a large market, once a fortnight, frequented by individuals from a distance of even 20 leagues round. "Here," says Inglis, "for the first time, one perceives a slight approximation to the usages of the country that lies beyond the majestic barrier of the Pyrenees. This is visible in the dress of the women, who no longer cover their heads with bonnets, hats, caps, or handkerchiefs, but with scarlet squares of woollen stuff, trimmed with black, which they throw over the head and shoulders, something in the form of the Spanish mantilla, &c." (*Inglis's Pyrenees*, &c., 228.) Tarbes is on the direct road to Bagnères de Bigorre (which see), and to Bagnères, distant only about 22 m. S. (*Hugo, art. Hautes Pyrénées; Dict. Géog.*, &c.)

TARN, a dep. of France, reg. S., formerly inc. in Languedoc; principally between lat. 43° 30' and 44° 10' and long. 1° 30' and 3° E., having N. and N.E., Aveyron; S.E. and S., Hérault and Aude; S.W., Haute Garonne; and N.W., Tarn-et-Garonne. Area, 573,577 hectares. Pop., in 1836, 335,844. This dep. is enclosed by mountain-ranges on the N.E. and S.; it slopes to the W., in which direction its rivers, the chief of which are the Tarn, Agout, and Viour, have their courses. The Tarn rises in Mount Lozère, and flows in a general S.W. direction, through the depts. Lozère, Aveyron, and Tarn, to about 15 m. from Toulouse, where it turns N.W., and ultimately falls into the Garonne, 22 m. above Agen. Its principal affluents are the Aveyron, on the right, the N. side, and the Agout on the left. Florac, Milhau, Alby, Montauban, and Moissac are on its banks. It is navigable for about 90 m. from its embouchure. In 1824, the arable lands in this dep. were estimated to comprise 326,410 hectares; meadows 41,848 do.; vineyards, 31,243 do.; woods, 80,291 do.; and heaths and wastes, 61,439 do. (*Offic. Tables*.) With the exception of the mountain tracts, the soil, speaking generally, is extremely good; and the valleys are not inferior in fertility to any in France. Agriculture, however, is in a very backward state; and the rotation of crops can hardly be said to be introduced. But the supply of corn, notwithstanding, exceeds what is required for home consumption. It produces from 400,000 to 450,000 hectolitres of wine, of which that of Gaillac, partly red and partly white, is the best. The former has *une couleur très foncée, beaucoup de corps, du spiritueux, et un bon goût*. (*Jullien*.) It is improved by a sea voyage, the white wines have similar qualities. Before the introduction of indigo into commerce, a good deal of wool was raised in the dep., and it is still cultivated round Alby. Cattle, of a good breed, are rather numerous; and the produce of wool is estimated at 150,000 kilogr. a year. In 1835, of 94,479 properties subject to the *contrib. foncière*, 42,613 were assessed at less than 5 fr., and only 107 at from 1,000 fr. upwards. There are mines of iron, copper, coal, and marble. Near Alby is a very extensive work for the conversion of iron into steel. The manufacture of cotton and woollen fabrics and yarn, of which Castres is the centre, employs about 15,000 hands. Silk furniture stuffs are made at Lavaur. Morocco leather, paper, cords, glass, copper wares, files, &c. in various parts. Tarn is divided into 4 arrondis; chief towns, Alby, the cap., Gaillac, Castres, and Lavaur. It sends 5 mems. to the Ch. of Deps. Registered electors, in 1838-9, 2,461. Public revenue, in 1831, 6,438,458; public expenditure, in do., 4,513,064. The land tax, or *contrib. foncière*, is said to be very oppressive in this dep. This dep. is one of the chief seats of Protestantism in France, and was a principal scene of the crusades against the Albigeans. (*Hugo, art. Tarn; Dict. Géog.*; *French Official Tables*.)

TARN-ET-GARONNE, a dep. of France, reg. S., in about lat. 44° and principally between the 1st and 2d degrees of E. long.; having N. the dep. of Lot, E. Aveyron, S.E. and S. Tarn and Haute Garonne, and W. Gers and Lot-et-Garonne. Area, 366,976 hectares. Pop., in 1836, 242,250. Surface generally undulating; in the S. and E. there are, however, some hill ranges of considerable height, the sources of a number of small streams. Principal rivers, Garonne, Tarn, and Aveyron, all flowing through the S. half of the dep. In 1834 arable lands were estimated to comprise 229,224 hectares, the meadows 17,846 do., vineyards 36,703 do. and woods 45,387 do. A greater proportion of wheat is

raised in this than in any other of the S. depts. of France; the estimated produce in 1835 having been 1,190,000 hectol. Rye, maize, and oats are also grown; and the total producé of grain considerably exceeds the home demand. The produce of wine amounts to about 450 hectol. a year, of which about 250,000 are exported, and converted into *cau de vie*. The finest are the red wines of the arrond. of Castel Sarrazin, the best of which have a fine colour, *du spiritueux, et un bon goût*. (*Jullien*, 244.) but the greater portion are inferior. Prunes, flax, hemp, and oil-seeds are among the other principal articles of culture. Irrigation is not well understood, and the produce of hay is small. Live stock are, in consequence, less numerous than in the adjacent depts.; the quality of the wool is inferior. Hogs and poultry are extensively fattened; the former for export to Spain. In 1835, of 85,711 properties subject to the *contrib. foncière* 32,712 were assessed at less than 5 fr., and only 95 at 1,000 fr. or upwards. The want of capital is a formidable obstacle to the progress of manufacturing industry. Some coarse woollen stuffs, with stockings and other fabrics of silk are made at Montauban; serges, linen cloths, and woollen yarn in the arrond. of Castel-Sarrazin; and there are some considerable tanneries, paper and flour mills, &c. Tarn-et-Garonne was made a dep. by Napoleon, on account of the importance of its capital, Montauban. It is divided into 3 arrondis, and sends 4 mems. to the Ch. of Deps. Registered electors, in 1838-9, 2,125. Total public revenue, in 1831, 6,108,515 fr. (*Hugo, art. Tarn-et-Garonne; Official Tables*, &c.)

TARRAGONA (an. *Tarraco*), a city and sea-port of Spain, in Catalonia, cap. prov. of its own name, at the mouth of the Francolí, in the Mediterranean, 45 m. W.S.W. Barcelona. Pop., according to Milano, 11,000. This once famous city is now contracted to a space which covers only a small portion of its ancient limits, and is ill built and dirty. A large and broad street, with some handsome edifices, has, however, been laid out within the present century. Its fortifications consist, besides the town walls, of two castles, and several batteries to protect the harbour; but the height on which the city stands is commanded by Mount Olivé. The river Francolí, adjacent to the city, is crossed by a narrow bridge of six arches, and the town is entered by six gates. Townsend says, "Tarragona, of all the cities in Spain, would give the most agreeable employment to the antiquary. Here he would admire the remains of an amphitheatre, of a circus, of the palace of Augustus, of temples, and of an extensive aqueduct, with fortifications, which, although of a more recent date, are ancient." (*Journey*, &c., iii. 311.) But, according to Inglis, in 1833, the remains of the amphitheatre were then little more than visible. Near Tarragona is the building called the tomb of the Scipios, in which the father and uncle of S. Africanus, who were killed in battle with the Carthaginians, are said, though on no good authority, to have been buried. It is about 19 ft. sq. and 28 ft. in height, resembling the tomb of Theron at Giganti. In the front, facing the sea, are statues of two warriors in a mourning posture, roughly cut out of the stones of the sepulchre, and much worn by the sea air. The inscription is so much defaced that it can hardly be deciphered. The cathedral of Tarragona is worth a visit, particularly the court and cloisters, which are surrounded with numerous pillars.

The archbishopric is one of the most ancient in Spain, having existed in the 7th century. It has several convents, an hospital, a seminary, academies of design and naval architecture, other superior schools, a theatre, &c. "Tarragona is the chief exporting port of Catalonia. Its exports consist of nuts, almonds, wines, and brandy. The nuts sent to the English market are known by the name of Barcelona nuts; but they are neither grown near, nor exported from Barcelona. They are grown more in the interior of the prov., and are all exported from Tarragona. The average export of nuts to England is from 25,000 to 30,000 bags (1 to a ton) a year. The export of almonds is about 12,000 bags. From 5,000 to 5,500 pipes of wine are exported from Tarragona to Rio Janeiro, Guernsey, Jersey, &c.; and about 400 pipes of brandy are exported chiefly for Certe and Cadiz, from which places it finds its way into the wine butts of Bordeaux and Xeres. Cork-wood and cork-bark are also exported from Tarragona." (*Inglis's Spain* in 1830, ii. 277.)

Pliny says that Tarraco was founded by the Scipios, who planted a colony in it (lib. iii. cap. 3.); but most probably it had been founded previously, and was only increased by the Scipios. It was the seat of a principal tribunal, and was, in fact, not merely the capital of *Hispania Citerior*, or *Tarracensis*, but of Spain, under the Romans. Augustus resided in it for a short period, and Hadrian enlarged its port and erected a mole. It was taken by the Goths in 467, and by the Moors in 714, from whom it was retaken by Alfonso of Aragon in 1220. It was several times the place of meeting of the States of Catalonia. In 1705 it was captured by the English, who at first intended to retain it as a military post, but after-

wards abandoned it for Gibraltar. In 1811 it was taken and sacked by the French under Suchet. Orosius the historian is said to have been a native of Tarraco, though the fact has been disputed. (*Milano; Townsend; Inglis; Mod. Trav., &c.; Cellarii Geog. Antiqua*, i. 140.)

**TARSUS**, a celebrated city of antiquity, and still a town of some importance, in Asia Minor, pachalic of Itehl, cap. snjak, on the Cydnus, about 12 m. from the Mediterranean, and 82 m. W.N.W. Scanderoun. Lat.  $36^{\circ} 46' 30''$  N.; long.  $34^{\circ} 46' 45''$  E. Its permanent pop. is estimated at about 7,000. (*Boerling's Rep.*); hot during winter a great many Turkish, Greek, and Armenian families flock into the town. The modern town does not cover one fourth part of the area occupied by the city under the Romans, and few vestiges remain of its former magnificence. The remains of a theatre, and of a spacious circular building, an ancient gateway, and beyond the walls a singular and solid structure, 120 paces in length, by about 60 in breadth, are among the principal. Some traces are perceptible of the more ancient walls, but those now inclosing the town are not supposed by Kinnel to be of an earlier date than the time of Haroun Al Raschid, in the 8th or 9th century; and the castle is said to have been built by Bajazet. The houses seldom exceed one story in height; they are terrace-roofed, and the greater part are constructed with brown stone, furnished by the more ancient edifices. There are two public baths, a number of mosques, several caravanserais, a small church, &c. The plain around Tarsus is very fertile, and cultivated by Greeks, chiefly for corn and cotton, which last is a principal article of export, the others being wool, bees' wax, gall-nuts, copper, goats' hair and skins, ox and buffalo hides, and hair sacks. The river Cydnus is now navigable only by very small boats, and the greatest part of the produce exported is shipped at Meris, a port or roadstead about four hours' journey W., at which there is said to be good anchorage all the year round. The value of the imports and exports may amount to about 100,000*l.* a year each. (*Boerling, Rep. on Syria; Geog. Journ.*, x. 508, &c.; *Kinnel, &c.*)

Nothing is known of the origin of Tarsus; but it is abun- tantly certain that it was very ancient, and that it had either been originally founded by Greeks, or had subsequently received a Grecian colony. It was the metropolis of Cilicia, and was captured by both Cyrus and Alexander. It continued to flourish under the successors of the latter, and under the Romans. Strabo says it was very populous and powerful; and he further adds, that its schools of philosophy, literature, and science were superior even to those of Athens and Alexandria (lib. xiv.). and though this be obviously an extravagant eulogy, there can be no question that it was a most distinguished seat of learning. St. Paul, the apostle of the Gentiles, was a native of Tarsus, where he was born in the second year of the Christian era, and where he acquired a competent knowledge of Greek literature before he went to study the law of Moses at Jerusalem. To ingratiate themselves with Julius Cæsar, the inhabs. changed the name of the city to Julisepolis; and it is plain, from the statement of St. Paul (Acts, xviii. 28.), that some of them, if not all, ranked as Roman citizens. Tarsus produced several other distinguished individuals; among whom may be specified Antipater, the stoic; Athenodorus, the philosopher, and friend of Augustus, &c. (*Cellarii Geographia Antiqua*, ii. 251.; *Ancient Universal History*, vi. 131. 8vo. ed. &c.)

**TAKTARY**, **TAKHARY**, or **TURKESTAN**, a very extensive region of Central Asia, partly comprised in the Chinese empire, and partly distributed among states of **BUKHARA**, **BUKHSAN**, **KHIVA**, **KOKAN**, the **KUCHUK STEPPE**, which see.

**TATTA**, a town of N.W. Hindostan, and one of the principal in Sindh, near the Indus, about 130 m. above its mouth, and 55 m. S.W. Hyderabad. Lat.  $24^{\circ} 44'$  N., long.  $68^{\circ} 17'$  E. Pop. estimated at less than 15,000, by Burnes, who describes it as "an open town, built on rising ground in a low valley. The houses are formed of wood and wickerwork, plastered over with earth; they are lofty, with flat roofs, but very confined, and resemble square towers. Some of the better sort have a base of brickwork, but stone has been used only in the foundations of one or two mosques. A spacious brick mosque, built by Shah Jehan, still remains, but it is crumbling to decay; and there is little else in modern Tatta to remind one of its former greatness. Its commercial prosperity passed away with the empire of Delhi. Of the weavers of *boongees* (silk and cotton fabrics), for which it was once so famous, 125 families only remain; and there are not 40 merchants in the city. Such has been the decay of Tatta, so populous in the days of Nadir Shah. The country in its vicinity lies neglected, and but a small portion of it is brought under tillage." (*Bukhara*, &c. i. 27.) Tatta has been supposed to represent the *Taddata* of the ancients, and with some reason, since at this point the Indus, as noted by Arrian (lib. vi.), divides itself into two branches; but no conclusive evidence has been elicited on this subject.

**TAVISTOCK**, a parl. bor., market-town, and par. of England, co. Devon, hund. Tavistock, on the Tavy, 13 m. N. Plymouth. Area of par., which is identical with the parl. bor., 11,660 acres. Pop., in 1831, 5,602. The town is on the N.W. bank of the river, here crossed by three bridges, and from which the ground rises, by a steep acclivity on both sides, to the height of several hundred feet. A very contracted valley from the N. is also occupied by houses closely packed together. The parts of the town built on higher ground to the N., and overlooking the more expanded valley to the W., are of more modern date. The streets, in many parts, are irregular and indifferently paved; but the houses are good, and the town generally is pleasant. Tavistock appears to have owed its origin to an abbey of black friars, founded here by an earl of Devon, in 961. At the dissolution of the monasteries, this abbey, along with the lordship of the town, was given by the king to John Lord Russell, the ancestor of the present Duke of Bedford. Some remains of the monastic edifice still exist; the former refectory is now used as an assembly-room, and near one of the bridges is a large handsome arched and pinnaced gateway, apparently of the time of Henry VI. The principal remains of Tavistock abbey are in the perpendicular style. The par. church has 4 aisles, a chancel, a tower at the W. end, and in its interior are several good monuments. The living, a vicarage, worth 299*l.* a year, is in the gift of the Duke of Bedford. There are meeting-houses for Wesleyans, Independents, Unitarians, Friends, &c., a large and convenient workhouse, a national school, chiefly supported by the Duke of Bedford, some small educational endowments, almshouses, and other public charities. Tavistock was one of the four stannary towns in the co., and is governed by a portreeve, chosen yearly at the lord's court, who is also the returning officer of the borough. It has sent 2 mems. to the House of C. since the 2d of Edward I.; the right of voting, down to the Reform Act, having been in freeholders of inheritance in possession inhabiting within the bor. The pop. is chiefly agricultural, though some serges and coarse linens are made, and mining and the working of iron occupy a few hands. Markets on Fridays. Fairs, Jan. 17., May 6., Sept. 9., Oct. 10., and Dec. 11., for cattle. Tavistock gives the title of marquis to the Duke of Bedford. Sir Francis Drake, the famous navigator and naval commander, belonged to the immediate vicinity of Tavistock, where he was born in or near 1545. (*Boundary Report*, &c.)

**TAUNTON**, a parl. bor., and market-town of England, co. Somerset, W. division, hund. Taunton Dean; on the Tone, here crossed by a stone bridge of two arches, 37 m. S.W. Bristol. Area of parl. bor., about 1,450 acres. Pop., in 1831, 12,148. Taunton is one of the principal towns in the co.; the main streets are spacious, well paved, and lighted with gas. They run mostly from E. to W. and from N. to S., the town being about 1 m. in length, and nearly as much in width. The houses are generally good, and have frequently extensive outlets and gardens; the appearance of the town indicates a prosperous, respectable community. There are, however, several lanes and courts (popularly called *edgemoes*) branching from the main street, which were formerly filled with inhabs. but little above the condition of paupers, who had been drawn into these close and unwholesome recesses to be within the limits of the bor., and to exercise the franchise extended to every inhabitant housekeeper. (*Bound. Report*.) The most striking public edifice is St. Mary Magdalen's church, in an open space in the heart of the town. It is 98 ft. in length by 50 m. in greatest breadth. Its nave is divided into 5 aisles by 4 rows of clustered columns, supporting bluntly-pointed arches; and at its W. extremity is an elegant quadrilateral tower, with a pinnace at either corner, their entire height being 150 ft. This church is richly decorated both without and within, and has numerous monuments, a fine organ, &c. Much of its decoration is said to be due to Henry VII., in return for the strenuous support of the Lancastrian cause by Taunton; but the tower and other parts of the edifice seem to have been erected somewhere about the end of the 14th century. Rickman (*Gothic Architecture*) says, that this church is a very fine example of the enriched perpendicular style. St. James's, the old conventual church of Taunton priory, is a plain but strong and well-furnished building. The living, a perpetual curacy, worth 254*l.* a year, is in the gift of Sir T. C. Lethbridge. There are chapels for Independents, Wesleyans, Baptists, Unitarians, Friends, Rom. Catholics, &c.; the last named is a handsome building of the Ionic order. There is also a Franciscan convent, occupying what was originally intended for a general hospital. At the W. end of the town is the castle, built in the time of Henry I. on the site of another fortress, built about 700 by Ina, king of the West Saxons. This edifice comprises the hall, in which assizes for the co. are held in Lent, general quarter sessions at Michaelmas, and a court of requests weekly. The market-house is a large, old edifice, surrounding the corn-market, town hall, &c.

sembly-rooms, &c.; and besides it is a handsome building in the Ionic order, the lower part of which is a fish and poultry market, and the upper a library and reading-room, museum, &c. The Taunton and Somerset Institution, established in 1823, has a spacious reading and news-room, and a valuable, though not extensive, library. There is a neat theatre in the town. The numerous charities of Taunton include the grammar-school, founded in 1522, and having a small endowment; a school for 80 boys and 50 girls, supported by voluntary contribution; several almshouses; the Taunton and Somerset Hospital, with accommodation for 26 patients; an eye infirmary, a lying-in charity, &c. The town has a weekly newspaper.

Taunton was one of the first towns in England in which the woollen manufacture was established; but the woollen trade of the town has greatly declined, and the industry of the inhabitants is now chiefly exercised in manufactures of silk stuffs, as crapes, sarsonets, &c., and of lace. The town derived considerable advantage from the construction of the Taunton and Bridgewater canal, by which a good deal of Welsh coal is now brought to it in return for the agricultural produce of the vicinity. The trade of Taunton has also experienced renewed activity since the opening of the Great Western railway, as far as Bridgewater. Taunton was formerly a municipal borough, but in consequence of neglect in filling up the vacancies in the corp., it lost its charter in 1792. It is a parl. bor., by prescription, and appears to have sent 2 members, to the H. of C. as early as the 23d Edward I. Previously to the Reform Act, which confirmed its privilege of sending 2 mems., the right of voting was in potwallopers not receiving alms. Reg. electors 1839-40, 1,010. The returning officers are the bailiffs, chosen at an annual court leet. Taunton, though not alluded to in the "Library of Antiquities," was, in all probability, known to the Romans, as a great number of Imperial coins have been found in and near it. In the time of the Heptarchy it was a place of considerable note. In the civil war, it sided with the Parliament, and in 1615 its castle sustained, with success, a long siege against the royal forces under Lord Goring. Markets, Wool, and S. &c. Fairs, June 7, and July 7 to 10, chiefly for cattle and horses (*Parl. Reps.*; *Proc. Inf.*)

TAURIDA, a government in the S. of European Russia, consisting partly of the peninsula of the Crimea, and partly of a tract on the mainland, lying between the Danube, the Black Sea, the Sea of Azoff, and the Berda. Area, 43,218 sq. m. Pop., in 1858, 520,600. The mainland part of the government, which, though the least interesting, is the most extensive, consists almost entirely of vast, and in many parts sterile plains, denominated the Steppe of the Nogais, from the Tartar tribes, by which it is principally occupied. "These," says Dr. Clarke, "are a very different people from the Tartars of the Crimea; they are distinguished by a more diminutive form, and by the dark copper colour of their complexion, which is sometimes almost black. They bear a remarkable resemblance to the Laplanders, although their dress and manner have a more savage character." (i. p. 318, 8vo. ed.) Above 17,000 Germans are colonised to the E. of the river Molotchna. (For further particulars see art. CRIMEA in this work.)

TAY, a river of Scotland, being the largest of the Scotch, and, in respect of the quantity of water it conveys to the sea, it is the greatest even of the British rivers. It rises in the high mountainous country a little to the N. of Loch Lomond, and, flowing N.E. by Killin, expands into the beautiful long narrow lake called Loch Tay. Issuing thence, its course is N. and E. to Logierait, S. to Dunkeld, E. to Kinclaven, S., inclining a little to the W., to Perth; N.E. to the point of Rhind; then north-easterly, past Dundee, till it falls into the sea between Teutismoor Point and Buttumness. From Rhind Point to Dundee the channel of the river expands into an estuary called the Frith of Tay. From its source to Dunkeld the Tay flows with a rapid current; partly through a very wild, and partly through a highly picturesque, romantic country. Its subsequent course as far as Perth is through a comparatively fruitful country; and from the latter to the sea, it flows through the richest and finest valley in Scotland.

From Buttumness to Dundee the river is navigable for ships of 500 tons' burden; and at high water, vessels of above 100 tons' burden reach Perth, 20 m. above Dundee. Two lighthouses have been erected on Buttumness, to mark the entrance to the river. The bar at its mouth has 24 fathoms water over it. Dundee, the port of the Tay, has wet docks and a pier harbour; the latter dries at low ebb; but at high water springs it has a depth of 14 or 15 ft., and at neaps of 9 or 10 ft. Large ships anchor in the channel of the river. The mouth and channel of the Tay are a good deal encumbered with sand-banks; and its navigation is rather difficult, partly on that account, and partly from the strength of the tides.

Among the more remarkable of the tributaries of the Tay, may be mentioned the Lyon, which joins it near

Fortingal. The Tummel has its sources in the moor of Rannoch, and flowing through the loch of that name, is joined, near the pass of Killlicrankie, by the Garry, from the confines of Loch Erchie. - The united river falls into the Tay at Logierait. Near Kinclaven the Tay receives the united waters of the Airdle, the Isla, and other rivers flowing S. from the mountains on the confines of Aberdeenshire. At Rhind Point it receives its important tributary, the Earn, flowing E. from Loch Earn. The basin of the Tay comprises a space of about 2,400 sq. m.; and Mr. Smetton ascertained that it carries to the sea more water than even the Thames. Its course from its source to Buttumness is estimated at about 110 m. It is the finest salmon river in Great Britain; its fisheries let for a large sum; the fish being mostly conveyed, packed in ice, to London.

TCHERNIGOFF, a government of European Russia, to the E. of the Danube, and between the government of Smolensk on the N. and that of Poltava on the S. The estimates of the area differ very widely; perhaps it may be taken at about 19,000 sq. m. Pop., in 1838, 1,300,000. Surface flat; soil fertile; climate dry, healthy, and mild. Principal river Dniestr, which bounds it on the W., and Desna, by which it is intersected. All sorts of corn are raised, but principally rye, barley, and oats. Produce of the harvest estimated at about 4,600,000 cwters. Flax and hemp, tobacco, hops, &c. are also cultivated. Oxen, of a very fine breed, are raised and fattened to a great size. Horses small, hardy, and active. There are some pretty extensive forests. Free cultivators are common in this and the other governments of Little Russia. Manufacturing industry, though still very backward, has made much progress during the present century. Spirits largely consumed, and there are numerous distilleries. Commerce considerable: the exports consist principally of cattle, tallow, hides, &c., spirits, honey and wax, potash, hemp, &c. (*Schultz's, La Russie*, &c., p. 459.)

TEFLIS, or TIFLIS, a city of W. Asia, the cap. of Georgia, and of all the Caucasian and Trans-Caucasian provs. of Russia; on the Kuir (an. *Cyprus*), 20 m. E. by N. from Trebizond. Lat. 41° 30' 30" N., long. 45° 17' 30" E. Pop., probably about 30,000, most of whom are Armenians, with some Musulman families. "Teflis occupies the right bank of the Kuir, in a contracted valley formed by irregular mountains, parallel with the stream on the side of the city, and hills coming down in a point quite to the water's edge on the other. A circular fort covers this point, and together with a small suburb is united to the city by a bridge of a single wooden arch, thrown over the river; while the ruined walls of an old citadel crown the top, and extend down the side of a part of the opposite mountain. The old and native part of the city is built upon the truly Oriental plan of irregular narrow lanes, and still more irregular and diminutive houses, thrown together in all the endless combinations of accident. Here and there European taste, aided by Russian power, has worked out a passable road for carriages, or built a decent house, overlooking and putting to shame all its mid-walled and dirty neighbours. A line of bazaars too, extending along the river, and branching out into several streets, together with much hustle and business, display some neatness and taste, and is connected with two or three tolerable caravanserais. Several old and substantial churches, displaying their bellies and cupolas in different parts, complete the prominent features of this part of the city. In the N. or Russian quarter, officers, palaces, government offices, and private houses, living broad streets and open squares, have a decidedly European aspect, and exhibit in their pillared fronts something of that taste for showy architecture which the edifices of their capital have taught the Russians to admire. Teflis has the appearance of an excessively busy and populous place. Its streets present not only a crowded, but, unlike many Oriental cities, a lively scene. Every person seems hurried by business. Nor is the variety of costumes, representing different nations and tongues, the least noticeable feature of the scene." (*Smith and Dwight's Missionary Researches*, 121-124.)

The Armenian cathedral is a large and somewhat striking edifice; there are two mosques, and among the other places of worship is a German Protestant chapel. It has also a French and a German hotel; but they are represented as being, in most respects, the reverse of what they should be. House-rent is very high; but otherwise living is not expensive. Teflis has many remarkable sulphureous hot springs, their temp. varying from 100° to 112° Fah.; and to these, it is supposed by some, the city owes its name. Over some of these the Russian government has erected the crown-baths, a plain edifice, but which, by being kept in good order, differs widely from all the other bath establishments in the city, and realises a handsome revenue. Teflis is very favourably situated for trade, and its commerce is pretty extensive, having greatly increased during the period of Russian occupation. Almost all the trade is, however, in the hands of Armenians; in 1830, scarcely half a dozen mercantile houses existed belonging to

any other foreigners, and only one European consul (a Frenchman) resided here. In 1830, the Russians founded a school in Tebis, which has since been erected into a gymnasium; and there are some other schools. Georgia in general, and its capital in particular, has been long celebrated for the beauty of its women; and, according to the missionaries referred to above, "this has not been over-rated, for we have never seen a city so large a proportion of whose females were beautiful in form, features, or complexion, as Tebis."

Tebis does not boast a very high antiquity. It is said to have been built in 469, by Vachtang, the founder of a dynasty which ruled from the Euxine to the Caspian. It was taken by Jenghiz Khan; by the Turks in 1576; sacked by Aga Mehemet Khan in 1795; and fell to the Russians in 1801. It suffered greatly from the ravages of the cholera in 1830. (*Smith and Dwight's Miss. Researches; Lyall's Trav. in Russia; Mod. Trav.*, xvii.; *Diet. Geog.*, &c.)

TEHERAN, or TEHRAUN, the modern cap. of Persia, prov. Irak-Ajemi, near the foot of Mount Elborz, which divides that prov. from Mazanderan, 211 m. N. Isfahan; lat. 35° 40' N., long. 51° 22' 50" E. Pop., during the residence of the court, estimated at from 60,000 to 70,000, or upwards. It is about 5 m. in circuit, and is enclosed by a strong earthen wall flanked with numerous towers, surrounded by a glacis, outside which is a large dry ditch. The appearance of the city from a distance is picturesque; but it has few public edifices worth notice; and notwithstanding it has many good shops and bazaars, it is said by Morier to have a "muddle" look within, its houses, like those of other Persian towns, being constructed of sun-dried bricks, while many of its streets are wretchedly paved. The Ark, or citadel, comprises, besides the royal residence and harem, quarters for the guards, the record chamber, treasury, hall for receiving ambassadors, and other public offices, 10 batts, two or three gardens, reservoirs, &c. The grand saloon in the palace is said to be very magnificent: the throne is a platform of pure white marble, raised a few steps from the ground, and carpeted with shawls and cloth of gold; and the whole interior of the apartment is profusely decorated with carving, gilding, arabesque painting, and looking-glass, the last material being interwoven with all the other ornaments, from the vaulted roof to the floor. The mosques, colleges, and caravanserais, though not very numerous, are in good repair. Much less than a century ago, the present metropolis of Persia would hardly have been considered of sufficient importance for the cap. of a prov. It first became the metropolis towards the end of the last century, under Aga Mahomed Khan, who seems to have selected it for that dignity partly on account of its good position in a military point of view, and partly from its vicinity to the hereditary possessions of his family, the greatest drawback is its unhealthyness from damp, which, with the excessive heats in summer, oblige the sovereign and his court to remove at that season, and encamp in pavilions and tents on the plains of Saltanea, or Oujan; at which period the resident pop. of Teheran is reduced to perhaps 10,000. The environs of Teheran are not unpleasant, the plain both to the E. and W. being covered with villages, and abounding in grain. To the N. of the town is a handsome palace, which its situation and the fine gardens that surround it make a delightful residence.

A short distance S. from Teheran are the ruins of the city of Rhé, generally supposed to be identical with the ancient Rhages, the capital of the Parthian Kings, where Alexander halted for five days in his pursuit of Darius. The ruins cover a great extent of ground, having in their centre a modern village, with a noble mosque and mausoleum—an oasis in the midst of the surrounding desert. (*Kinnier's Persia*, 118.; *Forster's Persia*, 61.; *Morier, &c. in Mod. Trav.*) It should, however, be mentioned that Major Rawlinson and others contend that the ruins now noticed are not those of Rhages, but of an Arabian city, called Rhei; and that the ruins of Rhages are to be found at Kalah-Erig, 30 m. E. Teheran. (*Geog. Journal*, x. 135., &c.)

TEIGNMOUTH, a market-town and sea-port of England, co. Devon, hund. Exminster, at the mouth of the Teign, in the English Channel, 12 m. S. Exeter. It is intersected by the Teign; the communication between its two divisions, each of which constitutes a parish, being kept up by a long wooden bridge across the river, having a drawbridge at either extremity for the accommodation of vessels. Area of both parishes, 1,240 acres. Pop., in 1831, 4,688. W. Teignmouth, or the portion on the W. side the river, is irregularly built, and ill paved; but E. Teignmouth is beautifully situated, and having been of late much improved, is now one of the most favourite watering-places in the S.W. part of England. The church of W. Teignmouth is a modern octangular structure; the living being a curacy worth 80*l.* a year, under the vicarage of Bishop's Teign. In this part of the town there are Independent and Calvinist meeting-houses, a national school, a quay on the river, and a

dockyard, in which sloops of war and vessels of 200 tons' burden have been built. E. Teignmouth church is mostly a modern edifice: the living, a perpetual curacy, worth 127*l.* a year, is in the gift of the vicar of Dawlish; and here, also, are a Baptist chapel, an endowed school for 13 poor children, some good inns, a theatre, reading-rooms, and other establishments usual in a watering-place. Teignmouth is governed by a portreeve, chosen annually at the court-leet of the lord of the manor. Many of its inhabs. are employed in the coast fishery, and others in the supply of goods to visitors: a good deal of the Haytor granite is also shipped from this port; but the bar at the mouth of the river renders the harbour accessible only to coasting vessels. Teignmouth is of high antiquity, and is said to be the place at which the Danes first landed in 787. It gives the title of baron to the Shore family.

TELICHERRY, a town of British India, presid. Madras, and one of the principal sea-ports in the district of Malabar; on the W. coast of Hindostan, 42 m. N.N.W. Calicut; lat. 12° 45' N.; long. 75° 33' E. Pop. uncertain. This was the chief trading establishment of the British on the Malabar coast previously to 1800, when the E. I. Company's warehouses were transferred to Mahé, about 6 m. to the S.E. The most wealthy natives, however, still reside at this town; which a few years since continued to be the mart for the best sandal wood from above the Ghauts, and cardamoms from Wynad. (*Hamilton's E. I. Gaz.*)

TEMESWAR, a royal, free, and fortified town of Hungary—beyond-the-Theiss, cap. co. of its own name, in a marshy plain, on the Alt Béga river, 72 m. N.N.E. Belgrade; lat. 45° 42' 27" N., long. 21° 14' 17" E. Pop., with its four suburbs, about 13,000, including numerous Germans, Greeks, Wallachs, and Jews. Mr. Paget says, "Temeswar, the capital of the Banat, and the winter residence of the rich Hungarians, is one of the prettiest towns I know anywhere. It has two handsome squares, and a number of very fine buildings. The county-hall, the palace of the Bishop of Csana, the residence of the commander, and the town-house, are all remarkable for their size and appearance." Temeswar was taken from the Turks in 1716 by Prince Eugene, who laid out and strongly fortified the modern town, which is now one of the principal fortresses of the Austrian monarchy. It has a Rom. Cath. and a Greek cathedral, a synagogue, seminary, Plarist gymnasium, arsenal, military school, some barracks, and various other military establishments, and is the seat of the principal civil establishments and authorities of the Banat. Good water is raised by machinery for the supply of the town. It has manufactures of silk and woollen stuffs, paper, tobacco, oil, &c.; and an extensive trade in these articles and in the transit of agricultural produce. Its inhabs. are said to be generally silent. Its commerce has been considerably facilitated by the excavation of the Béga Canal, about 73 m. in length, which, passing by the town, unites it with the navigable portion of the Béga, and, consequently, with the Theiss and the Danube. This canal has also been advantageous from its assisting in drying the marshes by which the town is surrounded; though in summer it is still rather unhealthy. Temeswar is supposed by D'Anville to represent the an. *Tibiscus*, to which Ovid was banished. It was taken by the Turks, under Polymán, in 1551, who held it till 1716. (*Paget's Hungary; Berghaus; Austr. Nat. Encyc.*)

TEMPE, a famous valley and defile in the N.E. part of Thessaly, stretching from near Baba to the gulph of Salonica, from 6 to 8 m. in length, between Olympus on the N., and Ossa on the S. It is traversed by the Selenambria (an. *Peneus*), and is, in parts, so very narrow that there is merely room for a military road along side the river. In some respects the defile bears a striking resemblance to the pass of Killisnoakin in Scotland, but the scenery is incomparably more magnificent. The appearance of the chasm, and the traditions current in antiquity, leave little doubt that the rocks had been rent asunder by some tremendous convulsion of nature, which opened a passage for the waters that must previously have deluged the greater part of Thessaly. In some parts it is grand in the extreme. The precipices consist of naked perpendicular rocks, rising to a prodigious height; so that the spectator can scarce behold them from below without giddiness. Livy's description, therefore, in addition to its intrinsic grandeur, has all the majesty of truth: *Rupes utrinque ita abscissæ sunt, ut desuper vis sine vertigine quadam simul oculoque animique possit: Terræ et tonitus et altitudo per medium vallonem fluentis Penei annis.* (Lib. ult. cap. 6.) (*Clarke, vi. 370.*)

The character of this gorge or defile is evidently that of wildness and savage grandeur, and does not, therefore, harmonise with the descriptions the poets have given of it the *Ἐφφρητὰ ἀγίατα Τέμπε* (Hor. Od. iii. v. 24.), or the *Tridentia Τέμπε* (Catullus, Carm. xlii. v. 285.) No doubt, however, their descriptions apply not the pass itself, but to a vale at the mouth of the pass

next the sea, " which, in situation, extent, and beauty, amply satisfies whatever the poets have said of Templemore." (*Cramer's Ancient Greece*, 1, 378.)

TEMPLEMORE, an inland town of Ireland, prov. Munster, co. Tipperary, about 14 m. W. from the Suir, and near the E. foot of the Devil's Bit Mountains, 74 m. S.W. Dublin. Pop., in 1831, 2,936. 'This is a neat town, in a comparatively rich and improved part of the country. It has a handsome par. church, a Rom. Cath. chapel, a Methodist meeting house, a school on the foundation of Erasmus Smith, a fever hospital and dispensary, a market house, a bridewell, and large infantry barracks. Petty sessions are held on Wednesdays; fairs on Jan. 30., March 20., May 17., June 24., July 30., Sept. 3., Oct. 21., and Dec. 7. It is a consular station. Post-office revenue in 1830, 6271. In 1836, 7782.

TENASSERIM PROVINCES, the name given to a long and comparatively narrow strip of territory in India beyond the Ganges, belonging to Great Britain, comprised within the Bengal presidency, with which, however, it has no natural connection. It consists principally of the provs. taken from the Birmanse in 1825-26, or of the W. or coast districts of Siam, comprising Martaban, or Amherst, Ye Tavoy, and Mergul, with its archipelago, extending between 11° and 19° N. lat., and about 98° and 99° E. long., having N. the independent Siam country, E. and S. Siam, and W. the Birmanse empire and the Indian Ocean. Area loosely estimated at 39,500 sq. m. The pop. being said to amount to only 85,000, though, notwithstanding its thinness, we believe that this is greatly below the mark, and that 160,000 would now be a nearer approximation. These provs. are shut off from Siam by one of the great mountain ranges, which, branching from the table-land of Yunnan, traverse the Ultra-Gangetic peninsula in a S. direction. This chain rises, in this part of its course, to the height sometimes of 5000 ft., and is every where clothed with dense forests. Immediately along the coast the country is an alluvial flat covered with mangroves; and more inland, wherever it has been cleared, is found to be very fertile. It is extremely well watered; the great river, Than-lwin, or Thmlin, divides the prov. of Martaban from Birmah, and there are a variety of minor rivers, some of which are navigable to a considerable distance.

In the N. provs. the year may be divided into the rainy and dry seasons, each of about six months' duration; but the latter resolves itself into the cold and hot seasons. These last are not very distinctly marked; but the coldest months are December and January, when the thermometer is sometimes, in the morning, down to 55°, but in the hottest part of the day ranges between 70° and 80°. The hot season immediately succeeds the cold, and continues until the rain begins to fall in April or May. The rains then commence, and continue until September or October; and although during a part of this time the sun be in its zenith, yet the most incessant fall of rain renders this season the most refreshing part of the year. The annual fall of rain, during these six months, is about 200 inches. (*Mason, in the Pinang Gazette*.) In the S., where both the climate and products in many respects differ, it rains at least every fortnight throughout the year. The Tenasserim provs. are, upon the whole, much more healthy than many parts of India. As in other tropical climates, the most frequent diseases, common to both natives and foreigners, are, dysentery, with intermittent, remittent, and bilious fevers. They seldom prove fatal to the natives, and usually do so to Europeans only when the constitution has been impaired from other causes. The staple product is rice, of which a dozen different varieties are cultivated. Upland rice is grown on the hill sides by the Karean tribes, and much rice by the Birmanse and other settlers. In the lowlands, in the beginning of April the farmer weeds his ground, and about the first week in June, when the rains commence, he hires a drove of buffaloes, if he have none of his own, and drives them about in a compact body over the wet field until the whole soil has been sufficiently worked to receive the seed. The principal harvest is in December, when the grain is reaped by a sickle, somewhat like the English. The ears are trodden out by buffaloes, and the rice is husked and bruised by means of a wooden mortar, or by a handmill, formed of two grooved logs of wood, set upright and fitted into each other; a kind of machinery superior to that in use for the like purpose among other nations in a similar stage of civilisation. Indian corn is not much raised, but sweet potatoes, yams, beans, onions and cucumbers are common. Tobacco is cultivated all over Tenasserim, as every one smokes. "From the child of three years of age to the decrepid grand sire, from the governor's wife to the rice beater." (*Low's Hist. of Tenass.*) The sugar cane is also pretty general, though no marketable sugar be made. Cotton, hemp, indigo, pepper, &c., are only partially cultivated. Cardamoms, long pepper, catechu, and cocoa nuts, are gathered wild. Fruits are numerous, and the forests produce teak, sapan, aloes, and many other valuable woods, with bambos, rattans, and many balsamic and medicinal plants. Iron ore is found in Ye and Tavoy.

Vol. II.

tin, is very abundant in the S. provs., but has not been seen in the N. Like gold, which is also widely diffused, it is obtained chiefly by washings. Trenches are dug, leading into the creeks, down which rapid streams run in the rainy season, and wash down the metallic particles. The workman goes into the water, with a wooden dish in the form of an inverted cone, and having filled it with sand and pebbles, whirls it round on the surface of the water, by which motion the lighter materials fly out, and leave the heavier down, in the vortex of the inverted cone, consisting of a tea-spoonful or upwards, of the gold sand. Without further cleaning it goes to the smelter, and produces, I am told, from 50 to 75 per cent. of pure metal. Although all persons, Birmanse or Kareans, are at liberty to procure the metal without any interference from government, yet few engage in the work; from which we may fairly infer that the returns are not remarkably profitable. (*Mason*.) Coal has been discovered in Mergul. Salt is made in numerous parts along the coast, and large quantities of saltpetre have been obtained from the bats' dung, collected in immense lime-stone caves in different parts of the country. The number of elephants inhabiting these provs. is supposed by Dr. Helfer to be proportionally greater than in any other part of India. The Birmanse settlers hunt the elephants, and carry away kinds of articles from their ivory. Rhinoceros' horns are an article of trade, but the valuable skin of that animal is not met with in commerce, and indeed, the trade in all kinds of hides, which might be made very profitable, has hitherto been wholly neglected. (*See Helfer's Rep.* 72-3.) Wax, honey, tortoiseshell, and edible birds' nests, are the principal commercial products derived from the animal kingdom. The insect races are in great variety, and constitute one of the greatest pests of the country.

The manufactures are few; those of cloth and silks are the principal, but they have been, in a great degree, superseded of late years by the cotton goods imported from England and Hindostan. The weavers are almost exclusively women, and there will hardly, perhaps, be found a house throughout the provs. which has not a loom. The inhabs. of Tenasserim and Mergul carry on a brisk petty trade with the ports between those towns and Rangoon. They also occasionally visit Pinang, the Nicobar Islands, Achin, Chittagong, and Dacca, exchanging their own produce for betel nut, raw and wrought silks, white muslins, earthenware, woollens, petroleum, cutlery, Chinese umbrellas, a little opium, ambergris, &c. The merchants of Tavoy are richer than those to the S.; their exports are of much the same kind; their imports are cotton, tobacco, petroleum, piece goods, cutlery, iron in bars, European and Bengali articles, &c. But Martaban is the prov. best situated for commerce. Besides its trade seaward, (*see MAULMAIN, ante*, p. 222.), a great deal of internal petty trade is carried on by boats of from 3 to 30 tons burden; and caravans arrive occasionally from the confines of China, bringing lac, drugs, swords, manufactured cottons and silks, raw silk, candied sugar, earth nuts, blank books, ivory, and horns; and taking back salt, spices, cotton, quicksilver, assafetida, borax, chintzes, piece goods, broad cloth, and various European articles. Capt. Low says, that the average of a late general estimate, from authentic documents, for one year, makes the value of the imports amount to 650,000 rupees, and that of the exports to only 175,000 rupees, though we doubt whether any such discrepancy can, in fact, exist between them. The weights and measures, as well as the usages and habits of these provs., are mostly Birmanse; the present inhabs. being of Birman extraction, though, according to tradition, the earliest inhabs. of the country were Siamese. Maulmain is the cap., and residence of the Governor and chief British authorities; subordinate officers are resident in the towns of Ye, Tavoy, and Mergul. The public revenue, derived from an assessment on grain of 20 per cent., one of 25 per cent. on other landed produce, taxes on gaming, opium, arrack, betel, &c.; birds' nests, fines, capitation tax, &c. has been estimated at 237,000 rupees a year. (*Low's Hist. of Tenasserim in Asiatic Journal; Helfer's Report, &c.*)

Malcolm, the American missionary, has pointed out some of the advantages derived by these provinces from their connection with England. "English influence," says he, "in a variety of ways has improved their condition. It has abolished the border wars, which wretched the people and their neighbours continually wretched. Various other improvements are perceptible. Coin is getting introduced instead of masses of lead and silver; manufactures are improving; implements of better construction are used; justice is better administered; life is secure; property is sacred; religion is free; taxes, though heavy, are more equitably imposed, and courts of justice are pure generally. Formerly men were deterred from gathering round them comforts superior to their neighbours, or building better houses, for fear of exactions. Now, being secure in their earnings, the newly-built houses are much improved in size, materials, and workmanship. The presiding officer in each prov.

sits as magistrate on certain days every week, and before him every citizen, male or female, without the intervention of lawyers, may plead his cause, and have immediate redress. Every where; in British Birmah, the people praise English justice." (*Macolm's S. E. Asia*, 173-4.) Indeed, notwithstanding the present thinness of the pop., emigration from Birmah into the Tenasserim provs. has been going on ever since we have held possession of the latter. Such, in truth, is the destructive influence of the Birman government, that, during the time it possessed Tenasserim, it had all but converted it into a desert.

TENBY (Welsh, *Dynbydd-y-Pasgod*), a par. and munic. bor., market town and seat of Wales co. Pembroke, hund. Narberth, on the summit of a promontory on the W. side of Carmarthen Bay, 9 m. E. Pembroke. Area of the in-liberty of the par. St. Mary, which is co-extensive with the bor., 322 acres. Pop., in 1831, 1,942. The town consists principally of one long and broad street, lined with good houses, and pretty well paved. It is partly surrounded with walls, and is further defended by some batteries on the shore; its castle, supposed to have been built by the Flemings, by whom this part of the country was formerly occupied, is in a state of decay. The church of St. Mary is a spacious structure 146 ft. in length and 83 in breadth, with an elegant spire 152 ft. in height, supposed to be the latest in Wales, and painted white to render it a conspicuous mark for seamen. The roof of the nave is supported by arcades, having fluted pillars, and the ceiling is formed of carved wood ornamented with several figures, armorial bearings, &c. In the interior are several monuments. The living, a rectory and vicarage, worth 317*l.* a year, is in the gift of the crown. (*Eccles. Rep. Rep.*) "An ancient edifice within a few ft. of the W. entrance is now used as a school. A flight of steps on the outside leads to the apartment near which is a small arch in the style of Henry VII., and two others occur in an old wall opposite. These are supposed to have formed the principal entrances to St. Mary's College, once a convent of Carmelite friars, founded in 1399. The remains of St. John's chapel are situated in a marshy spot 200 or 300 yards from the town. Those of St. Julian's stand upon the pier, near its extremity. Opposite the town are some wild masses of rock, forming the islands of St. Catherine, and more distant are those of St. Margaret and Caldy. Eastward stretch the Norton sands bounded by grand and high cliffs; here are several bathing machines. Round the S. and W. sides of the town are the white or whit-sands, presenting a romantic and agreeable walk, two m. in length, to Giltar." (*Nicholson's Cambrian Guide*, p. 606.) The town hall, court house, new market and slaughter houses, public baths, assembly rooms, theatre, reading-rooms, bowling green, several good hotels, &c., are the other most conspicuous objects at Tenby. The town was formerly a place of much commercial importance; and after the settlement of the Flemings here, it exported considerable quantities of woollen cloths. At present its trade is inconsiderable.

Tenby is a creek of the port of Milford. Nine or ten vessels from Plymouth, Brixholme, &c. make it their station during the fishing season, and supply the Bristol market. Its oysters, which are of superior quality, are sent pickled to London, Liverpool, and other places. Tenby is now principally distinguished as a watering-place, for which it is singularly well adapted, by the great beauty of its situation, and the protection from rough weather which it receives from the contiguous head-lands. It has grown rapidly, especially in good houses; most of which have been built within the last 20 years. A great many are occupied as lodging-houses during the season, and left empty for the rest of the year. Property of this sort appears likely to increase fast and steadily: houses are continually springing up in the many agreeable situations which are found unoccupied. (*Boundary Report*.) The public baths are both extensive and elegant; they comprise numerous bath and dressing rooms, warm and vapour baths, bed-rooms for invalids, a handsome promenade room, &c.; and are approached by an excellent carriage road. The water of their large reservoirs is changed every tide. The bathing-machine is the property of the innkeepers: the terms *ls.* each time, and *6d.* the guide. (*Camb. Guide*, p. 604.)

Tenby is governed by a mayor, 3 other aldermen, and 12 councillors. Its earliest charters appear to have been granted about the time of Edward III., by the earls of Pembroke, but the earliest extant is of Richard III. Previously to the Municipal Reform Act, there were nearly 400 burgesses in the corporation, but their functions were merely nominal: and the whole management of the bor. rested with the common council, which consisted of about 40 members. The town has only a few small endowments for charitable purposes. Courts of petty sessions weekly, a manor court, &c. are held; but the only gaol consists of 2 large cells, formerly the old garrison dungeon. Prisoners are rarely confined here: when

the term of imprisonment exceeds a month, they are sent to the gaol at Haverfordwest. Corporation revenue, in 1840, 1,104*l.* The Reform Act did not alter the previous limits of the par. bor., which now sends 1 mem. to the H. of C., in conjunction with Pembroke, Wiston, and Milford. It had previously sent one with Pembroke and Weston only, the right of voting having been in the burgesses, who, acting under the influence of the common council, returned the nominee of the patron of the bor. Registered electors, in the different bors., 1839-40, 1,179. (*See Man. Appent.*, p. 407.) Markets, Wednesdays and Saturdays; fairs, May 4, Whit Tuesday, July 31, Oct. 2, and Dec. 4.

TENEDOS, a small but celebrated island of Turkey in Asia, 15 m. S.S.W. from the mouth of the Dardanelles (an. *Hellaspontus*), and about 5 m. W. from the shore of the Troad, which it still serves to point out, its highest summit, Mount St. Elias, being in lat. 39° 50' 15" N., long. 26° 3' E. Pop. 7,000. Though rugged, it is tolerably fertile, and well cultivated. The red muscadine wine of Tenedos, though not mentioned by the ancients, is, perhaps, the best of the Levant. It begins to lose its colour when about 14 or 15 years of age, but retains its flavour and strength for a much longer period. The town, on the N.E. side of the island, is defended by a small fort. On the N. the port is protected by a pier, and it has pretty good anchorage. In antiquity it was a sort of *dépot* for the produce destined for Constantinople; and Justinian erected in it a large warehouse, the ruins of which are still extant, where vessels loaded with corn from Alexandria discharged their cargoes when they happened to be prevented, as was frequently the case, by contrary winds, from making a passage through the Hellespont to the capital. (*Tournefort*, i. 397.)

Tenedos, according to Strabo (lib. xiii.), had a temple dedicated to Apollo; but it is principally known from us having been mentioned in connection with Troy by Homer—

"Thou source of light! whom Tenedos adores;"

Pope's *Hamlet*, i. 11. 77.

and by Virgil. According to the latter, it was the place to which the Grecian fleet made their feigned retreat before the sack of Troy:—

"Ed in conspectu (Troia) Tenedos notissima fama.

Insula, dives opum, Priami dum regna manebant."

*Æneid*, ii. 11. 91.

TENERIFFE, or TEYDE (PEAK OF), a famous conical and volcanic mountain in the centre of the island of Teneriffe, of which its basis occupies the greater portion (*See CANARY ISLANDS*), rising, according to Borda, to the height of 11,424 French, or 12,172 Eng. ft. above the level of the sea. According to Von Buch the Peak consists of an enormous dome of trachyte, covered with layers of basalt. The summit of the cone (*El Piton*, the sugar-loaf,) is terminated by a crater, surrounded, as it were, by a circular wall, or parapet. Humboldt, who descended to the bottom of the crater, found the heat was perceptible only in a few crevices, which gave vent to aqueous vapours, with a peculiar buzzing noise. (*Personal Narrative*, i. 173. *Engl. Trans.*)

The ascent of the Peak is distinguished by a difference of vegetation somewhat similar to that which is observed on the ascent of Etna, which see. Above the lower and more fertile tracts near the sea, where date trees, plantains, sugar-canes, Indian figs, vines, and olives, flourish in profusion, rises what is called the region of laurels. These are fed by a vast number of springs, that rise up amid a turf covered with perpetual verdure. Extensive plantations of chestnuts occur in the lower part, above which rise four species of laurel, and an oak resembling that of Thibet. The underwood in the lower part consists of arborescent heath, and in the upper part of ferns. Above this commences a vast forest of fir and pine trees which characterise the colder regions of the earth. Succeeding to this is a vast plain, like a sea of sand, covered with the dust of pumice stone, which continually fills the air. It is embellished with tufts of the beautiful shrub called the *retama* (*Spartium nubigenum*, Alkna), growing to the height of nine ft., and loaded with odoriferous flowers, which are said to communicate a peculiar excellence to the flesh of the goats that feed upon them. At the entrance of this plain the rich verdure of the island terminates, as well as all appearance of habitation; and the traveller ascends afterwards through a complete solitude. Above this sandy plain are the *Malpais*, a name which the Spaniards apply to grounds destitute of vegetable mould, and covered with loose and broken fragments of lava. The ascent here is steep, and extremely fatiguing, as the blocks of lava roll from beneath the feet, and often leave deep hollows. At the extremity of the *Malpais* is a small plain called the *Ranchara*, from the centre of which the *Piton*, or conical summit, rises to the height of about 2,350 feet. Here are found those spiracles which are called by the natives the *Nostrils of the Peak*, consisting of crevices whence issue

water and hot vapours. The ascent of the Piton is steep, and rendered difficult by the loose ashes with which it is covered. At the top there is scarcely room to stand, and the crater, as already stated, is enclosed by a steep wall.

The view from the top of the Peak, though characterised by peculiar beauty, falls far short of the magnificent prospect from the summit of Ktna. The cultivated and wooded parts of the island are, however, seen in close proximity, and the steep and naked declivities of the upper parts of the mountain strikingly contrast with the smiling aspect of the country beneath. The transparent atmosphere enables the spectator to distinguish minute objects, such as houses, sails of vessels, and trunks of trees. Beyond the eye wanders on all sides over the vast expanse of the Atlantic, and commands the whole archipelago of the Canaries. It has been alleged that the view extends as far as Cape Bojador, on the coast of Africa.

The summit of the Peak is a *solfatara*, or extinguished volcano, whence no eruption has taken place since its discovery by Europeans; but some eruptions have taken place from the sides of the mountain during the course of last century. In 1704, one occurred in the district of Guimar, which buried several valleys, and approached within a short distance of the port of Orotava. Two years after, in 1706, the lava, issuing forth in a different quarter, buried the town and port of Garachico, then the finest and most frequented in the island. Another eruption happened in June, 1798, not far from the summit of the Peak, but it was not productive of much damage.

Notwithstanding its proximity to the equator, and to the coast of Africa, the Piton, or cone, is covered with snow during several months of the winter, and snow is always found in the hollows not exposed to the sun's rays. A powerful heat is always felt on the ground at the summit of the cone, and Humboldt mentions that his hands and face, and those of his party, were frozen, while their boots were burnt by the heat of the soil on which they walked. (*Dictionnaire Géographique; Humboldt's Personal Narrative*, i. 187-194. *Eng. Trans.*; *Lyell's Geology*, ii. 138.)

TENNESSEE, one of the U. States of N. America, in the basin of the Mississippi, between lat. 35° and 36° 40' N., and lon. 82° and 90° W., having N. Kentucky and Virginia, E. N. Carolina, S. Georgia, Alabama, and Mississippi, and W. the river Mississippi, which divides it from Arkansas and Missouri. Area, 43,000 sq. m. Pop. in 1830, 681,900; in 1840, 820,210, of whom 183,059 were slaves. The E. part of this state is intersected by the Alleghany chain, which here sometimes rises to the height of 2000 ft.; the middle part is hilly, while the W. portion is an extensive undulating plain. Principal rivers: after the Mississippi, the Tennessee and Cumberland, both tributaries of the Ohio. The Tennessee rises near Franklin in N. Carolina, and runs at first N.W. to about 35 m. W.S.W. Knoxville; it then turns to the S.W., and continues in that direction to near Decatur in Alabama. After a bend to the W.N.W., it again enters the state of Tennessee about lon. 89° W., and its course thenceforward is generally northward to its mouth in the Ohio, about 20 m. S.W. Salem. At its outlet it is about 600 yards in width. It is navigable for steam vessels of large size for 250 m., and as much further for boats of 40 or 50 tons. It has several tributaries, some of which are navigable to a considerable distance; at present no towns of consequence are situated on its banks. Tennessee is generally well watered, and, except in the mountainous parts, comprises a good deal of excellent land. Agriculture is the chief occupation of the Inhabitants.

The products are pretty much the same as those of Kentucky, with the addition of cotton. Indian corn, wheat, and oats are the principal corn crops: the produce of the first, in 1840, amounted, according to the official returns, to 42,467,349 bushels; being a much larger quantity than was raised in any other state. The produce of wheat during the same year is stated to have been 4,547,273 bushels. Cotton is grown in most parts of the state, and its culture is rapidly increasing: the crop of 1835 was estimated at 150,000 bales. Tobacco is also cultivated to a considerable extent, its produce being estimated at about 5,500 hogheads. In the E. grazing is a good deal attended to; and considerable numbers of cattle and sheep are reared for the markets of the eastern states. Coal, iron, salt, marble, and nitre are found; and some of these, with cotton, Indian corn, wheat, flour, tobacco, fruit, tar, turpentine, rosin, whiskey, live stock, salted meats, lard, coarse linen goods, and gunpowder, constitute the principal exports, being mostly sent down the Mississippi to New Orleans. Several canals and railways have been projected, though, hitherto, but few have been completed.

The legislature consists of a senate of 25 mems., and a house of representatives of 75 mems., who, with the governor, are elected for two years. The judges of the supreme court are elected by a joint vote of both houses for twelve years, and those of the inferior courts in the same manner for twelve years. In the election for representa-

tives, every free white male citizen has the right to vote in the po. of which he has been an inhabitant for six months previously. The pay of senators and representatives is four-dollars a day. Murfreesborough was the former capital, but Nashville is now the seat of government. In 1840, there were 983 common schools in this state, attended by 25,690 pupils, and 3,330 persons were in the same year attending the superior academies and colleges. The school-fund, in 1839, amounted to 835,034 dollars.

The colonisation of Tennessee commenced about 1757, and the settlers entered warmly into the revolutionary war. The territory belonged to N. Carolina previously to 1790, when it was ceded to the United States; and in 1796 it was received as a state into the Union. It sends 13 mems. to the House of Representatives. (*Amer. Almanack*, 1840-42; *Encyc. Amer.*; *Encyc. of Geog.*, Amer. edit.; *Darby*, &c.)

TENTERDEN, a mun. bor., mar. town, and par. of England, in Kent, like Scray, the mun. bor., comprising all the land of Teutenden, and the par. of some name, together with a part of the par. of Ebouy, 43 m. S.E. London. Area of par. 8,620 acres. Pop., in 1831, 3,177. The town, which is finely situated on an eminence, environed by hop-grounds, is well built. It consists principally of a single street, continuous with which is the straggling village of Bird's Isle to the N., and a little to the E. is the hamlet of Lye Green. The par. church, a spacious structure, consists of a nave, N. aisle and chancel, with a well-built lofty tower at the one end, on which are sculptured the arms of the monastery of St. Augustine, to which foundation this church was appropriated in 1259. The living of Teutenden, a vicarage, worth 1771. a year, is in the gift of the dean and chapter of Canterbury. It has, also, chapels for Baptists, Wesleyans, and Unitarians, a free school founded in 1521, for six scholars, and which has been greatly enlarged by voluntary subscriptions, and several minor charities. Teutenden has no manufactures, and depends entirely on its retail trade with the rich agricultural country in which it is situated, and upon its proximity to Romney marshes: which has made it be selected as a place of residence by persons engaged in the grazing of sheep and cattle on the marsh. There are also a few gentlemen of independent fortune living in and about the town. There seems but little probability of its becoming a place of much greater importance than it is at present. It is neither paved, lighted, nor watched. (*Mun. Bound. Rep.*) In the reign of Henry VI., Teutenden was incorporated and annexed to the town and port of Rye; but the earliest existing charter is that of Elizabeth. It is governed, under the Mun. Reform Act, by a mayor, 3 aldermen, and 12 councillors, who hold petty sessions weekly, and a court of record every fortnight. Corp. rev., in 1840, 505*l*. Market day, Friday; fair, first Monday in May, for horses, cattle, and pedlery. (*Mun. Bound. and Corp. Rep. Append.*)

TEQUENDAMA (FALL OF), a celebrated cataract in the repub. of New Granada, Colombia, in the course of the Bogota river, a tributary of the Magdalena, a few miles W. from Bogota. A short distance above the fall the river is 140 ft. in breadth; but being forced into a narrow, though deep bed of only 40 ft. in width, it is precipitated at two bounds down a perpendicular rock, to the depth of 600 ft.; and even in very dry seasons, Humboldt says the volume of water still presents a side view of 90 sq. metres. The cataract forms an assemblage of every thing that is sublimely picturesque in beautiful scenery. This fall is not, as has been commonly said, the loftiest in the world; but there scarcely exists a cataract which, from so lofty a height, precipitates so voluminous a mass of waters." (*Humboldt's Researches*, i. 17.) The body of water, when it first parts from its bed, forms a broad arch of glassy appearance; a little lower down it assumes a fleecy form; and ultimately, in its progress downwards, it shoots forth into millions of small tubular masses, which chase each other like sky-rockets. The noise which attends the fall is quite astounding; and dense clouds of vapour are sent up, which rise to a considerable height, and mingle with the atmosphere, forming in their ascent the most beautiful rainbows. The comparative smallness of the stream which runs off from the foot of the fall, proves that a large proportion of the water is lost by evaporation. (*Ibid. Trav.*, xxvii. 330.) What gives the Fall of Tequendama a remarkable appearance, is the great difference in the vegetation surrounding its different parts. At the summit the traveller "finds himself surrounded, not only with the *aralia*, begonia, and the yellow bark tree, but with oaks, elms, and other plants, the growth of which recalls to his mind the vegetation of Europe; when suddenly he discovers, as from a terrace, and at his feet, a country producing the palm, the banana, and the sugar-cane. The true cause of this phenomenon has not been satisfactorily explained. The difference of altitude, about 175 metres, is, as Humboldt has stated, too inconsiderable to have much influence over the temperature of the air. (*Researches*, p. 79, &c.)

**TERAMO** (an. *Interamnia Præstulia*), a city of the Neapolitan dom. prov. Abruzzo Ultra, of which it is the cap., 947 ft. above the sea, in the angle formed by the Vezzoia, where it joins the Tordino, 16 m. W. from the embouchure of the latter in the Adriatic, and 19 m. N.N.E. Monte Corno, the highest summit of the Appennines. Pop., in 1830, 10,231. It was formerly surrounded by strong walls, but is now quite open. With one exception, its streets are narrow and dirty, and its houses, for the most part, mean-looking. In the outskirts, however, some of the houses are in better taste. The cathedral has been modernized. There are several convents, hospitals, asylums, &c. It has but few manufactures or industrial establishments; but it is the seat of the civil and criminal tribunals of the prov., and has a royal college, a seminary, or establishment for the instruction of the clergy; and is the residence of several opulent families. Its vicinity is in general fertile, producing corn, wine, and oil in abundance: in the time of the Romans its wine was in high estimation:—

*Tum qua vitiferos domitat Præstulæ pulvis  
Læta laboris agros. Silius Italicus, lib. xv. v. 568.*

Some buried arches, the vestiges of a theatre, baths, and some other edifices, are the principal remains of the ancient city. (*Del Re Descrizione delle Due Sicilie*, li. 47., &c.; *Craven, Excurs. in the Abruzzi*, l. 310.)

**TERCERA.** See AZORES.

**TERLIZZI**, an inland town of S. Italy, kingd. of Naples, prov. Bari, cap. cant., on an elevated site, 18 m. W. Bari. Pop. said to amount to about 10,000. Notwithstanding its size, it seems to possess little worth notice beyond the usual superabundance of religious edifices, if we except a gallery of pictures, comprising works by several of the great Italian masters, in the mansion of a noble family.

**TERMINI** (an. *Therme Himenses*, and simply *Therme*), a marit. town of Sicily, on the N. coast of the island; intend. of Palermo, cap. district and canton, near the mouth of the river of its own name, 24 m. S.E.E. Palermo, lat. 37° 57' 28"; N. long. 14° 42' E. Pop., in 1831, 18,942. It is finely situated on the declivity of a hill rising from the sea; and besides being surrounded by an old wall, is farther defended, towards the sea, by a castle on a high rock, commanding the town and port. The streets are, for the most part, narrow and dirty; but it has some pretty good public buildings, among which are several churches and convents, a royal college, 2 hospitals, a *monte-di-pietà*, an asylum for females, and convenient baths over the hot springs, for which the city has been celebrated from the remotest epoch, and from which she has derived her modern as well as her ancient name. The town is a *calefature*, or shipping port, and exports (mostly coastwise to Palermo), corn, oil, shumac, dried fruits, manna, &c. The sardine and anchovy fisheries are also actively carried on. The harbour, which is but indifferent, is open to the N. (*Smith's Sicily*, p. 95; *Rampoldi*, &c.)

About 6 m. E. by S. from Termini, are the ruins of the ancient *Himera*, near which Gelon, tyrant of Syracuse, totally defeated and destroyed an army of Carthaginians, said to have comprised no fewer than 300,000 men, commanded by Hamilcar, grandfather of Hannibal, who lost his life in the action. The Carthaginians were the allies of Xerxes, and their defeat is said by Herodotus (lib. viii. cap. 195.), to have happened on the same day that the Greeks gained the victory of Salamis, anno 480 B.C. But though it be abundantly certain that Gelon gained a great victory over Hamilcar, it is extremely improbable that the forces of the latter amounted to half the number mentioned above. Hannibal never had 100,000 men at any one time under his command; and the probability is that 30,000 would be much nearer the number of Hamilcar's army than 300,000. The ships which had conveyed the troops to Himera, are said to have been drawn up on the beach; and Captain Smyth says that so great a fleet and army could not possibly have been accommodated in the situation where the battle is said to have been fought. In fact, very little dependence is to be placed on the statements as to numbers, in most ancient authors; they are almost invariably much exaggerated.

At a subsequent period Hannibal avenged his grandfather's disaster by taking and utterly destroying Himera. Such of its citizens as escaped the massacre which took place on this occasion, sought an asylum in Therme. (*Cicero in Verrem*, li. cap. 35.) Augustus raised the latter to the rank of a colony. Stesichorus, one of the most ancient and celebrated of the Greek poets, was a native of Himera.

**TERNATE.** See MOLUCCA ISLANDS.

**TERNI** (an. *Interamna*), a town of the Papal States, deleg. Spoleto, in a rich and fine valley, near the right bank of the Nera (an. *Nar*),

*— Sulphura Nar albus aqua.  
— Euseb. lib. vii. lin. 614.*

about 4 m. W. from the famous falls of the Vellino, and 49 m. N.N.E. Rome. Pop., circ. 9,000. It is surrounded by a wall and towers; but though it has wide streets, some tolerable buildings, and a charming situation, it is, on the whole, poor and mean, retaining but few traces of its ancient splendour. It has a cathedral with a superb altar, an hospital, a monte di-pietà, and some other charitable foundations, a handsome theatre, and a building, erected in 1827, for the reception of the waters of the Vellino for the public accommodation. Among the remains of antiquity are some vaults of an amphitheatre constructed under Tiberius, portions of temples of the Sun and Cybele transformed into churches, and the remains of public baths. The surrounding country is extremely productive, *fecundissimos Italie campos* (Tacit. Annal. lib. i. cap. 79.); and on the river are flour and oil mills, tanneries, &c. (*Rampoldi*, &c.)

The historian Tacitus is said to have been a native of *Interamna*; but there is no evidence that such was really the case. The emperors Tacitus and Florianus are also said, but on no better grounds, to have belonged to it.

The falls of the Vellino, called the *Cascata del Marmore*, about 4 m. E. from Terni, are amongst the most striking objects of the kind that are any where to be met with. The total height of the fall, which is divided into three leaps, is probably (for there is the greatest discrepancy in the statements on the subject) from 650 to 750 ft. The water is conveyed to the fall in an artificial channel, more than 1 m. in length, originally dug by the consul Curius Dentatus, anno 274 B.C. (*Cicero, Epist. ad Atticum*, Epist. 15.); but the channel having been filled up by a deposition of calcareous matter, it was widened and deepened, and in part altered, in 1596, and again in 1785. Byron has appropriated some magnificent stanzas to a notice of these falls (*Child Harold*, cant. iv. st. 69—72.); and he adds in a note, "I saw the Cascata del Marmore of Terni twice at different periods; once from the summit of the precipice, and once from the valley below. The lower view is far to be preferred, if the traveller have time for one only; but in any point of view, either from above or below, it is worth all the cascades and torrents of Switzerland put together." (See *Cellarii Geographia Antiqua*, l. 751—778; *Eustace*, i. 327. oct. ed.; *Wood's Letters*, li. 97, &c.)

**TERRACINA** (an. *Anzur* and *Terracina*), a sea-port town of the Papal States, deleg. Frosinone, at the S. extremity of the Pontine Marshes, close to the Neapolitan frontier, 59 m. S.S.E. Rome; lat. 41° 18' 14" N., long. 15° 33' 37" E. Pop. about 6,000. This town, which is on the Appian Way, and adjoining the embouchure of the canal for the draining of the marshes, stands partly on low ground, and partly on the declivity of a hill. With the exception of the portion along the shore, it is ill built; and, owing to the deleterious air of the contiguous marshes, it is unhealthy, and the inhab. have a sickly appearance. On the hill is the cathedral, erected, as is supposed, on the site of the temple of Jupiter Anxurus; higher up are the ruins of the ancient Anxur—

*"Impositum saxis late cadentibus Anxur."  
Hor. Sat., lib. i. sat. 5.*

And crowning the brow of the rock which overhangs the modern town are the ruins of the palace of Gaeta, repaired and reoccupied by Theodoris, commanding a magnificent view of the Pontine Marshes, Monte Circeo, and of Gaeta and the Neapolitan shore, as far as Baia. Pope Pius VI. endeavoured, by improving the drainage of the marshes, and by clearing out and deepening the harbour, which had been completely filled up, to recover for Terracina some portion of its former importance. But his efforts have not had the anticipated success; and though the fishery be carried on to some extent from the port, it has little or no trade. In 1810, Napoleon suppressed the bishopric of Terracina.

Anxur, which was originally a town of the Volsci, subsequently became a Roman colony, and an important naval station. It was sacked by Alaric, and was occupied by the Arabs for about a century. It was also taken and sacked by a French force in 1798. (*Rampoldi*; *Cellarii Geographia Antiqua*, l. 812; *Wood's Letters*, li. 176., &c.)

**TERRANOVA** (an. *Gela*), a sea-port town of Sicily, prov. Caletanacta, cap. district, on the S. shore of the island, near the mouth of the river of the same name, 18 m. E. Alicata; lat. 37° 4' 30" N., long. 14° 17' E. Pop., in 1831, 9,780. It is well situated on a bank near the sea, and has a fine palace, belonging to its proprietor, the Duke de Monteleone; but the streets are irregular and dirty, and its castle, churches, and convents appear to be neglected. It has a tolerably good hospital. Water is said by Swinburne to be scarce, and dear. *Coarse cloth* is manufactured in the town; and having a *calefature*, or shipping station, it has some trade in the exportation of corn, wine, sulphur, soda, &c. The cloth made in the town finds a good market at the commercial fair

held in August. The anchorage at Terranova is opposite to, and about 1 m. from the shore, in from 7 to 11 fathoms. It is, like other places on the same coast, open to the southerly gales, which sometimes throw in a heavy sea. In 1839, 67 ships (35 of which were British), of the burden of 4,881 tons, cleared out from the port. Smyth says that a party of strolling players has existed in this town for more than half a century, called the *Compagnia degli Uniti*, from their all sharing alike in the gains of the society.

Though the question be not free from difficulty, there seems every reason to think that Terranova, and not Alicata, occupies the site of the ancient Gela. It has some remains of antiquity, consisting of the foundations and mutilated fragments of a great temple, and of a Doric column. Gela was a Rhodian colony, and early attached to considerable distinction. But it is principally memorable for having given birth to Gelon, prince or tyrant of Syracuse, famous alike for his virtues, and for his great victory over the Carthaginians, commanded by Hamilcar, grandfather of Hannibal. Gela was subsequently destroyed by Phintias, tyrant of Agrigentum, and is included by Strabo among the uninhabited towns of the island. The modern town was founded by Frederick of Arragon, towards the close of the 13th century. (*Smyth*, 196.; *Swinburne*, ii. 301.; &c.)

TERUEL (an. *Turdeto*), a town of Spain, cap. prov. of its own name in Aragon, on a hill, at the foot of which flows the Guadalquivir, 75 m. N.W. Valencia. Pop. about 8,640. It is walled, and tolerably well built. Being a bishop's see, it has numerous churches and convents; one of the latter, belonging to the Jesuits, being the largest edifice in the town. The cathedral, an extensive building, though its architecture be not wholly in good taste, is sumptuously adorned within, and has, or, at all events, had, many fine paintings. It has several fountains supplied with water by an ancient aqueduct. Its manufactures comprise woollen and linen fabrics, shoes, and earthenware, with fulling-mills, dyeing houses, tanneries, &c. The vicinity is very fertile, and near it are some celebrated warm sulphur springs. Teruel is the residence of a military governor, and was a fortress of some consequence under the Moors, from whom it was taken by Alphonso II. in 1171. (*Milano*, &c.)

TESCHEN, a town of Austrian Silesia, cap. circ. and duchy of same name, on the Olsa, a tributary of the Oder, 36 m. E.S.E. Troppan. Pop. about 7,000. It is well built and has three suburbs, a ducal castle, several Rom. Cath. churches, a Lutheran church, and gymnasia for both persuasions, that of the former possessing, it is said, a library of 12,000 vols. (*Berghaus*). There are several other superior schools, and a military asylum. Teschen is the seat of the circle tribunal and other courts, and has manufactures of woollen cloths, cassimeres, leather, fire-arms, &c. Here was signed a treaty between Austria and Prussia, in 1779.

TESSIN, or TICINO, the most S. canton of Switzerland, between lat. 45° 50' and 46° 37' N., and long. 8° 25' and 9° 12' E., being separated by the main chain of the Alps from Uri and the Grisons on the N., while on other sides it is surrounded chiefly by the Austrian and Sardinian territories, the lakes Maggiore and Lugano forming parts of its S. frontier. Area estimated at 1,034 sq. m. Pop., in 1837, 113,923, all Rom. Catholics. Most part of this canton is either mountainous, or divided into numerous valleys by alpine ramifications: in the S., however, it sinks to the level of the plain of Lombardy. The Ticino, whence this canton derives its name, has its sources in Mount St. Gothard, in the Valtè Bedretto, Piora, Blegno, &c. Its course is generally southward, and after intersecting the canton near its centre, and traversing the Lago Maggiore in its entire length, it forms the boundary between Lombardy and Piedmont, falling into the Po at Pavia, after an entire course of about 100 m., about 60 of which are navigable. The climate of Tessin is mild; and though its pastures be not so good, nor so well watered as those of the cantons N. of the Alps, its soil is generally very fertile. Agriculture is, however, extremely backward, partly from the ignorance and want of industry of the inhabitants, and partly from the too great subdivision of the surface into small properties, portions of which at great distances from each other sometimes belong to the same proprietors. Wheat, rye, and maize are the principal grains raised; a good deal of tobacco is cultivated. Wine is grown in many districts; but, like the Italian wines, that of this canton will not keep for any considerable period. The silk of Tessin is of superior quality; and a supply worth from 200,000 to 300,000 Swiss francs is sent annually into other parts of Switzerland. (*Pictet*.) Most of the fruits common to Lombardy flourish here: the chestnut woods are extensive, and chestnut flour is largely consumed by the inhabitants. The canton abounds with timber, but much of it is useless from the want of roads and expense of carriage. About 3,000 quintals a year of cheese are sent into Italy, and calves, sheep, and hogs are also exported.

The chamois is a native of this canton. It sometimes breeds with the domestic goat, and the resulting progeny is greatly prized for its skin. There are scarcely any manufactures, and the trade of Tessin is chiefly in the conveyance of goods between Switzerland and Italy. A great many of the male natives of the canton emigrate to Milan, Venice, Trieste, Turin, Marseilles, and the adjacent countries, where they serve as confectioners, chocolate manufacturers, waiters in coffee-houses, &c.; leaving the labours of the field and the care of the cattle to the women.

Tessin was merely a territory subordinate to Switzerland till 1815, when it was admitted into the Confederation, in which it holds the eighteenth rank. Its government was materially altered in 1830; when the grand council, which holds the sovereign and legislative power, was made to consist of 114 mems., chosen in the different communes by all the citizens born in the canton twenty-five years of age, and who possess immovable property to the value of 200 Swiss francs, or the usufruct of such property to the value of 300 francs. It chooses its own president, and meets each year by rotation in Bellinzona, Locarno, and Lugano. The executive body, or lesser council, consists of 9 mems., chosen by the greater council among its mems. Equality before the laws, the freedom of the press, and the right of petition, are guaranteed. Tessin is subdivided into 8 districts and 38 circles, and the latter again into communes. In every commune there is a municipal council of from 3 to 11 mems., with whom rests the direction of the local police. A justice of the peace sits in each circle; in each district there is a court of primary jurisdiction; and for the whole canton there is a supreme tribunal of 13 mems. Criminal processes appear to be more common in this than in most other cantons of Switzerland. The public revenue, principally derived from salt and custom duties, in 1833-34, amounted to 897,300 Swiss livres: expenditure to 787,640 ditto. Public debt, in 1830, 5,041,450 ditto. Contingent to the army of the Swiss Confederation, 1,804 men.

The inhabs. of Tessin are of middle stature, and generally square and strongly built; though, on account, it is said, of their irregular mode of life, among other causes, they seldom attain a great age. In many respects they resemble their Italian neighbours, and their language is a dialect of the Italian. Among them have been several eminent painters, sculptors, and architects; the latter including Domenico Fontana, who completed the dome of St. Peter's, and executed many other great works in Rome. But the bulk of the inhabs. are very backward in point of education, and some of the communal magistrates can neither read nor write. It has no council of public instruction, no literary association (except, perhaps, in Lugano), and scarcely a library. The habits of the people are dirty and depraved. According to Pictet, "*L'Eloge de la sobriété Italienne ne convient aux habitants du Tessin, ni sous le rapport de la boisson, ni sous celui du manger. Quoique dorénavant naturellement des dispositions les plus heureuses, ils manquent d'amour du travail, d'industrie, et de ressources, en sorte qu'ils sont inférieurs aux autres peuples de la Suisse en moralité et en aisance, malgré tout ce que la nature a fait pour eux*." (*Pictet*, *Statistique de la Suisse*, p. 474-490.; Ebel, &c.)

TETBURY, a market-town and par. of England, co. Gloucester, hund. Longtree, near the source of the Avon, 163 m. S.S.E. Gloucester. Area of par. 4,980 acres. Pop., in 1831, 2,939. The town consists of several streets, meeting in its centre, in which is a large market-house. It is well built, the houses being mostly of stone. The par. church is a handsome edifice: having, with the exception of the tower and spire, been rebuilt in 1781. It has chapels for Independents and Baptists, a grammar-school, a well-endowed Sunday school for all the poor children of the par., an almshouse for 8 poor persons, &c. The businesses of woolcombing and wool-stapling are carried on, but to no great extent. The supply of water used formerly to be very deficient; but the deficiency has been obviated by the sinking of several deep wells. Markets on Wednesdays; fairs, four times a year, for corn, cheese, cattle, lambs, and horses. A fortified camp, probably of the ancient Britons, formerly existed here; and Roman coins have been frequently dug up in and near the town.

TETUAN, a town and sea-port of Morocco, kingd. Fez, prov. Hasbat, on the shore of the Mediterranean, 33 m. S.E. Tangier. Pop. said to amount to 16,000; of whom 9,000 may be Moors, 4,200 Jews, 2,000 blacks, and 800 Berbers. (*Griëberg of Hemsé*.) The town stands on the declivity of a hill crowned with a square castle, the residence of the governor. It is of considerable extent, and its walls are flanked in different parts with square forts, on which a few pieces of ordnance are mounted. Cannon are also placed on the castle, and on a square tower at the mouth of the river forming the port; but it could not oppose any effectual resistance to a European force. The streets are narrow and dirty, and as in Fez and other cities of Morocco, many aro

nearly covered in by the upper stories of the houses. The latter are frequently of two stories, and tolerably well built and finished; and there are several good mosques. In commercial importance Tetuan ranks next to Fez, from which place it receives the goods brought by the caravans from Tunis, Algiers, Alexandria, Timbuctoo, &c. Wool, corn, and other provisions, wax, hides, cattle, leather, some manufactured stuffs, and other African produce, are exported to Spain, France, and Italy, in return chiefly for European manufactures. The port of Marteen is about 2 m. from the sea, on a small river, the mouth of which is now so choked up with sand as to admit only of the entrance of small craft. The roadstead, formed by a high point of land which runs out into the sea W. of the river, is sheltered from W. winds, but during the prevalence of those from the E. vessels must retire to some other place. Tetuan was formerly the residence of several European consuls; at present, however, no Europeans being allowed to reside in the town, their functions are performed by vice-consuls, who are mostly Jews. (*G. af. Hensö, Imp. dal Morocco; Mod. Trav. xx.*)

TEWKESBURY, a parl. and mun. bor., market-town, and par. of England, co. Gloucester, hund. Tewkesbury, on the Avon, near its confluence with the Severn, on the border of Worcestershire, 9 m. N.E. Gloucester, and 90 m. N.W. London. Area of the mod. parl. bor., which is identical with the par., 1,830 acres. Pop., in 1831, 5,780; in 1841, 5,861. It consists of two principal thoroughfares, meeting in the form of the letter Y, and from which many smaller streets branch out. The three principal streets are wide and respectable, but the other streets are inferior, and are principally occupied by the poor and labouring pop. (*Mun. Bound. Rep.*) The town is nearly insulated by the "Mill Avon" (an ancient cut, by which the Avon has been nearly diverted from its original channel), and its tributaries, the Carran and Swillgate brooks; and it is in consequence compactly built. Many of its houses are handsome, and it is well paved and lighted with gas. The rivers encircling the town are crossed by several bridges; and, in 1826, an elegant cast-iron bridge, having an arch 172 ft. in span, was thrown over the Severn, about 1 m. from the town. The par. church, which formerly belonged to a flourishing Benedictine abbey, that grew out of a monastery founded here in 715, is a large and noble structure. Its length is 317 ft. within the walls, and that of the transept 122 ft.; the choir and side aisles are 70 ft. in breadth, and the W. front 100 ft.; the height from the area to the roof is 120 ft.; and the height of the tower is 152 ft. Mr. Rickman says of this church, that it "is one of the most curious and magnificent edifices in the country. The nave is Norman, the piers are round and very lofty; at the intersection of the cross is a very fine Norman tower, adorned with arches both within and without, in several stages. The choir has a multangular east end, with additional chapels and a chapter-house, all of excellent decorated character; the windows of the aisle and transepts are some decorated and some perpendicular. The W. window is perpendicular, inserted into a very lofty Norman arch of great depth, with shafts and mouldings. In the windows of the choir are considerable remains of ancient stained glass. There are some traces of the cloisters remaining on the S. side of the nave; they were perpendicular and very rich. There are several portions of very good screen-work and stalls. The abbey gate is standing, though much dilapidated." (*Gothic Architecture*). It has many fine old monuments. The living of Tewkesbury, a vicarage in the gift of the crown, is said in the Ecclesiastical Report to be worth only 313*l.* nett, but it is affirmed to be worth above 500*l.* The market-house, a handsome structure, has Doric columns and pilasters, supporting a pediment in front. The town-hall, the lower part of which is reserved for the courts, and the upper part as a council-hall and assembly-room, was erected in 1788 by Sir William Codrington. The other public buildings include various dissenting chapels, a theatre, the borough gaol, and house of industry. Tewkesbury has a free grammar-school, founded in 1576; blue-coat, national, and Lancastrian schools, with almshouses, a dispensary, lying-in-charity, and several other benevolent establishments. The town formerly produced considerable quantities of woollen cloth and a superior kind of mustard. At present (1842) its principal manufactures consist of cotton hosiery. About 600 stocking-loomers are now employed in the bor. Wages vary from 3*s.* to 8*s.* a week, the average being about 6*s.* About 30 persons are also employed in the bobbinet-lace trade, earning about 15*s.* a week; and 25 workmen are engaged in the manufacture of nails. The carrying trade up the Severn and the corn-market have declined since the improvements in the navigation at Gloucester and the construction of the railroad between Stratford and Moreton; but, on the whole, the town is still in a thriving state. Tewkesbury has returned 2 mems. to the H. of C. since the 7th of James I. The right of voting, down to the Reform Act, was in freemen and holders of burgage tenements, of whom there were then 500. Registered

electors, in 1839-40, 409. The mun. is co-extensive with the parl. bor. The town is governed by a mayor, 4 aldermen and 12 councillors. It has a commission of the peace, a separate court of quarter sessions, a court of record for debts not above 50*l.*, &c. Corp. rev., in 1840, 1,306*l.* Markets, Wednesday and Saturday, for corn, cattle, poultry, &c. Fairs are held nine times yearly.

In a field in the immediate vicinity of the town, still called, from the circumstance, the "Bloody Meadow," was fought, on the 4th of May, 1471, a decisive engagement between the Yorkists, under Edward IV., and the Lancastrians, under Queen Margaret and her son. The Lancastrians were totally defeated, with the loss of a great many persons of distinction, and about 3,000 soldiers left on the field. Margaret and her son, having been taken prisoners, the latter was immediately assassinated. (*Bound. and Munic. Reports and Append.; Hunt's England, cap. 22.*)

TEXAS, a new and independent republic of N. America, between the U. States and Mexico, extending from 29° to 40° of N. lat., and from 94° to 108° W. long. It is separated from Mexico on the W. and S. by the Rio Grande, or Bravo del Norte; on the N. the Red River, and the Arkansas chiefly separate it from the W. territory of the U. States; on the E. the river Sabine divides it from Louisiana; and S. E. it borders the Gulf of Mexico. Its area has been estimated at 310,000 sq. m., of which rather more than one-fourth part has been appropriated. Its pop. is differently stated at from 200,000 to 350,000, but may probably amount to at least 300,000, chiefly Anglo-Americans.

The general aspect of the country is that of a vast inclined plane, gradually sloping from the mountains on the W. eastward to the sea, and intersected by numerous rivers, all having a S.E. direction. The territory is, however, naturally divided into three separate regions, which in many respects differ from each other. The first or level region extends along the coast, with a breadth inland varying from 100 m. where greatest in the centre, to 70 and 30 m., being most contracted towards the S.W. extremity. The soil of this region is principally a rich alluvium, with scarcely a stone, yet singularly free from stagnant swamps. Broad woodlands fringe the banks of the rivers, between which are extensive and rich pasture lands. The second division, the largest of the three, is the undulating or rolling-prairie region, which extends for 150 or 200 m. farther inland, its wide grassy tracts alternating with others that are thickly timbered. These last are especially prevalent in the E., though the bottoms and river valleys throughout the whole region are well wooded. Limestone and sandstone form the common substrata of this region: the upper soil consists of a rich friable loam, mixed indeed with sand, but seldom to such an extent as to prevent the culture of the most exhausting products. (*Iken.*) The third or mountainous region, situated principally in the W. and S.W., forms part of the great Sierra Madre, or Mexican Alps (see AMERICA, vol. i. 78.), but little explored and still unsettled. Its remote extremity it consists of an elevated table land, "where the prairies not infrequently resemble the vast steppes of Asia except in their superior fertility." The mountain sides are clothed with forests of pine, oak, cedar, and a great variety of trees and shrubs, and they inclose extensive alluvial valleys, most of which are susceptible of irrigation and culture. Mr. Kennedy says, that the sides of the mountains, and even not a few of their summits, are adapted to agriculture; and, if we might depend on the lately published statements, it would appear that there are very few, if any, countries of the same extent which have so small a proportion of unproductive land.

After the rivers already named, the principal, proceeding from N. to S., are the Neches, Trinidad, Brazos de Dios, Colorado, Guadalupe, San Antonio, and Nueces. They all fall into the Gulf of Mexico, or rather (except the Brazos de Dios) into its bays and lagoons. The latter bear a considerable resemblance to the halfs along the S. shore of the Baltic, except that they are upon a much larger scale: and the coast, as Humboldt has stated, presents every where formidable obstacles to navigation, in the long, low, narrow belts of land by which it is fenced, and which bound the lagoons, in the want of harbours for vessels drawing more than 12*ft.* feet water, and in the bars at the mouths of the rivers; still, however, steam vessels have been able to enter and ascend the Sabine to a considerable distance. The Neches is navigable for small steam boats for upwards of 100 m.; Trinidad river for 300 or 400 m.; and the Brazos de Dios, for at least half that distance. The Rio Colorado, a river larger than the Thames between Chelsea and Richmond, is obstructed by a raft about 10 m. above its mouth, but measures are in progress for removing this, when it is anticipated that it will be navigable for small steamers as high as Austin, the cap. of Texas, about 220 m. from its mouth. The San Antonio and Nueces are navigable only for comparatively short distances; but the Rio Grand del Norte, a noble stream, having an estimated course of 1800 m., will most probably, though in parts broken by rapids, become

hereafter an important commercial channel. Galveston Bay, into which the Trinidad flows, by far the finest on the coast, is about 35 m. in length N. and S., and from 12 to 18 E. and W. Its average depth is from 9 to 10 feet, but in the channel there are from 18 to 30 ft. water.

The Texan year is divided into a wet and a dry season. The former lasts from December to March, during which N. and N.E. winds are most prevalent; the latter, from March to the end of November, during which the winds vary from the S.E. round to S.W., may be subdivided into the spring, summer, and autumn. From April to September the thermometer in different parts of the country has been found at a general average to range from 63° to 100°; average heat 9 A.M., 73° F.; at noon, 83°; 3 P.M., 77° (Kennedy.) These great heats are, however, tempered by continual and strong breezes, which commence soon after sunrise, and continue till about 3 or 4 o'clock P.M., and the nights throughout the year are cool. From March to October little rain falls, though thunder storms frequently occur. During the rest of the year wet weather is prevalent; the rivers swell and inundate the country, and the roads are generally rendered impassable. Snow is seldom seen in the winter, except on the mountains. The climate is said by its pancyrists to be decidedly more salubrious than that either of Louisiana or of the adjacent parts of Mexico; but it is very difficult to imagine any satisfactory reasons why such should be the case, and we confess we entertain some considerable doubts as to the accuracy of the statement. On the low alluvial sea coast, intermittent fevers are admitted to be prevalent in summer, though not, it is said, to an epidemic extent; and the yellow fever, it is further stated, rarely if ever, occurs: indeed, Mr. Kennedy goes so far as to affirm, that "nine-tenths of the republic are considered healthier than the most healthy parts of the U. States." (i. 74.)

But, after making every fair allowance for exaggeration, there can be no doubt that Texas is both a fine and a fertile country. The surface is in most parts covered with luxuriant native grass, comprising, with the common prairie grass, the gama, musquite, wild clover, wild rye, &c., and affording excellent pasturage. It has, also, an ample supply of timber, as well for use as for ornament. Live oak (*Quercus sempervirens*), so valuable for ship-building, is here more abundant and of better quality, perhaps, than in any other part of America. White, black, and post oak, ash, elm, hickory, musquite (acacia), walnut, sycamore, *bois d'arc*, so called from the Indians using it to make their bows, cypress, caoutchouc, &c. are among the common trees; and the mountainous parts in the S.E. abound with pine and cedar of fine quality. Among the natural curiosities of the country, the "Cross-timber" of N. Texas, a continuous series of forests, varying in width from 5 to 50 m., and extending in a direct line about the long, of 97° W. from the woody region at the sources of the Trinidad, northward to the Arkansas river. It appears at a distance like an immense wall of wood; and from the W., such is its linear regularity, that it looks as if it were planted by art. It forms the great boundary of the W. prairies.

Texas is amply supplied with fruits and garden products. The climate of the lowlands is too warm for the apple, but almost every other fruit of temperate climates comes to perfection. Peaches, melons, figs, oranges, lemons, pine-apples, dates, olives, &c., may be grown in different localities with little cost.

Grapes are abundant; and being free from the "foxy" flavour common to the grapes of most parts of America, very tolerable wine has been made from them. Vanilla, tobacco, sarsaparilla, and a large variety of dyeing and medicinal shrubs and plants are indigenous; and on all the river-bottoms is an undergrowth of cane, so thick as to be almost impenetrable. Along the water-courses also, and near the sea, the larger trees are sometimes wreathed with Spanish moss, which serves both for fodder and for the manufacture of cheap bedding, &c. The flora of Texas is particularly rich and copious.

Cotton is the great agricultural staple of the republic; and it is affirmed, and perhaps truly, that it is very decidedly superior, as a cotton-growing country, to the best districts in the United States; producing a greater quantity of cotton per acre, and of a longer and finer staple. The best of the long-stapled cotton is produced in the low alluvial soils, and the short-stapled on the rolling or undulating lands. According to Mr. Iken, whose statements, however, we do not presume to guarantee, the advantages of the cotton planter in Texas over the planter in the U. States consists in the following particulars:—"He has cheaper land, a larger crop, a better staple, an earlier season to plant, and therefore to pick; likewise a longer season for the latter precarious operation prior to the rains and frosts doing injury; by the superior facilities for raising stock, he can feed his labourers about 50 per cent. cheaper than in the U. States; their clothing, owing to the lower tariff, will be far less expensive, and the more salubrious climate will make their lives a better purchase." (P. 45.) Superior cotton-

growing lands yield, it is said, from 1½ to 2 bales of clean cotton per acre, worth, in the Galveston market, perhaps 4d. per lb. Its cultivation hitherto has been principally on the Brazos and Colorado, Red and Trinidad rivers, and Caney creek; but it is steadily on the advance, and, according to Mr. Iken, the crop of 1841 may be estimated at 50,000 bales, of which, however, a considerable portion came down the Red river, and was included in the exports from New Orleans. Cotton planting begins in February, and picking in June. The latter employment is an easy and profitable occupation for women and children. Texan cotton has been for several years shipped direct to Liverpool in British bottoms.

The grains chiefly cultivated are maize and wheat. The average crop of the former, on good ground, is from 50 to 60 bushels per acre; but 75 bushels are said to be frequently obtained, and two crops may be gathered in the year, the first being usually planted in February, and the second late in June. (Kennedy.) A crop of excellent wheat has been cut in May, and the same land has yielded a heavy crop of maize in the ensuing October. The corn, we are further told, is generally worth from 1½ to 2 dollars per bushel at the farms, and from 2 to 3 dollars in the market. (Kennedy, i. 93.) But we incline to think that there must be some error about this statement: such prices are really higher than those of England; and appear to be wholly irreconcilable with the accounts of the wonderful productiveness of the soil. We have, in fact, little doubt that either one or the other statement, or, which is most probable, that both, are erroneous. Rye, barley, oats, &c., are suited for the upper country, and rice near the river estuaries; but small quantities only of these grains have hitherto been raised. The sugar-cane is also said to attain to greater perfection than on the Mississippi; and Mr. Kennedy states that the produce on a small plantation, despite the waste arising from very imperfect machinery, has averaged about 3,500 lbs. to the acre. (i. 92.) Tobacco will probably hereafter become an important staple. The mulberry grows vigorously, and the experiment of rearing silkworms has already, we are assured, been successful; and common and sweet potatoes are said, like every thing else in this fortunate land, to attain to perfection!

The rearing of live stock has, however, been long the principal and favourite occupation of the Texan settlers, and many of the prairies are covered with a valuable breed of oxen, which scarcely require, and certainly do not receive, much more care or attention than the prairie deer. It is usually estimated that 100 cows and calves, purchased for 1,000 dollars, will, in ten years, have increased about thirty-six fold, thus numbering 3,600, worth, at the same price, 36,000 dollars; though we may remark by the way, that, with such an enormous increase, it is not easy to see why the price should be the same. A profitable trade in cattle is opened with New Orleans, &c., and the West India islands offer coffee, of which the Texans use large quantities, in exchange for cattle. Salt, for curing beef, is obtained every where near the coast; and the hide, horns, and tallow, shipped to Europe, Mr. Iken says, will alone pay more than the cost of the animal. The rearing of horses and mules is also pretty extensively pursued: sheep thrive on the upper lands, but require folding. Hogs are very profitable; and bees, which are produced in great numbers, might also be made productive, there being an extensive demand for wax in Mexico. Vast herds of buffaloes and wild horses wander over the prairies, and deer are every where abundant. Bears, cougars, panthers, peccaries, wolves, foxes, raccoons, &c., are common; and most of the planters are obliged to keep packs of large and powerful dogs to prevent the destruction of their stock. Most of the birds known in the U. States are common to Texas, and the bays, &c., abound with fish of excellent quality, beds of good oysters, and other *testacea*. Alligators of 16 ft. in length are sometimes met with in the rivers, particularly Red River and its tributaries: turtles, tortoises, &c., in the estuaries. There are several venomous serpents, and, as in all other warm countries, mosquitoes and other insect plagues are common. But Mr. Iken, notwithstanding his wish to represent every thing belonging to Texas in the most favourable light, admits that "the inclination for luxurious indolence, to which the climate predisposes," is a worse evil than either serpents or mosquitoes; and "the settler," he adds, "will have much greater reason to be on his guard against this agreeable poison, than against that of the anguis in herbi!"

After the statements previously made, the reader will not be surprised to learn that Texas is represented as a peculiarly eligible country for emigrants, particularly agriculturists. Mr. Iken, among other practical hints to emigrants, lays it down that the first objects of a settler should be to fix himself in a decidedly healthy situation, with a fertile soil, plenty of timber, and good water; and, truly, if the emigrant whose estate comprises these advantages be not satisfied with his lot, it would be hard to say why he should go to improve it. In purchasing lands, the price varies greatly; but good land, with an

unquestionable title, may be obtained for from 3 to 5 dollars an acre, or even cheaper. Inferior capitalists will find the rearing of stock the easiest and most profitable pursuit; and those of a still lower class may, it is said, employ themselves profitably in cultivating a garden in the neighbourhood of some town, which generally affords a ready market for garden produce. The formation of such gardens is looked upon by Mr. Iken as "an object secondary only to the planting of fields." Agricultural labourers, without capital, are said to find little difficulty in connecting themselves with farmers already established, on advantageous terms. "The modes of husbandry in Texas are of the most simple description. The first object of the farmer, after building a small and temporary log-house, is to enclose a sufficient space of the open land adjoining, by the erection of a rail fence. He then proceeds to break up the land with a light plough, which is usually drawn by oxen. A yoke of large oxen, broken, is worth from 30 to 60 dollars; a horse, for general agricultural purposes, about 20 dollars. The Texan farmers generally content themselves with one ploughing, previously to planting. Manuring is altogether dispensed with. The seed-time for maize, cotton, and most other crops, is in February and March. A few hoeings to destroy weeds, to thin and to earth up the young plants, is all that is required on the part of the farmer to bring them to perfection." (*Iken's Texas*, 51, 52.)

In many parts of the rolling prairie region, coal of a superior quality, and iron ore have been found; and it has been supposed that beds of these valuable minerals extend over a great part of the country. Silver mines were wrought towards Santa Fé, in the N.W., till the works were destroyed by the Comanche Indians. Nitre abounds in the E.; salt is obtained from numerous lakes and springs; and bitumen in several places. Granite, limestone, gypsum, shale, &c. are abundant, except in the low alluvial region.

**Probable Progress of Texas.**—The reader will have already seen that we are disposed to entertain some considerable doubts with respect to the statements as to the extraordinary fertility of Texas. But admitting them to be true to the letter, still we should not be at all sanguine as to its future progress, and should think that European emigrants would do well to pause before they decide on establishing themselves in Texas. The soil is too fruitful, and the climate, especially in the lower and more fertile parts of the country, is decidedly too hot and relaxing to permit of any laborious employment being vigorously prosecuted by free labourers. Had the free importation of slaves into Texas been permitted, its progress might, and, most probably, would have been as rapid as that of the Southern States of the American Union. But the importation of slaves into Texas, except from the United States, is prohibited; and if the supply from this quarter should fail, and the prohibition of their importation from other quarters be really enforced, its progress will, we apprehend, be comparatively slow. It is a contradiction and an absurdity to suppose, that free settlers in such a country, should exhibit any considerable portion of the energy and industry they would exhibit if they had to cultivate a less fertile soil, or were placed under a severer climate. Mexico and the United States may both be referred to in illustration of this principle: industry is, in the former, at the lowest possible ebb (*see Mexico*); though it is needless to add that the incentives to labour are there quite as great as in Texas. And does any one suppose that the cultivation of cotton and sugar would have been carried to near its present extent in the Southern United States, but for their all but unlimited command of slave labour? We, therefore, are well convinced that the future progress of Texas will depend principally on the fact, whether it can or cannot derive ample supplies of slave labour. If it can (whether with or without the sanction of the law, is in this respect of no importance) the fair presumption is, that it will make a rapid progress; whereas if it cannot, the progress will, most probably, be comparatively slow; and we should anticipate that, under such circumstances, its inhospitable will gradually fall into the same state of semi-barbarous indolence into which the Mexicans have already sunk.

The geographical position of Texas is eminently favourable to the growth and extension of commerce. Its rivers and the facilities which the country affords for the completion of railways, will enable the traders and agriculturists to forward their produce easily to the coast, whence it may be forwarded to the European markets, and to those of Cuba and the West Indies generally. In exchange for the cotton and other products sent to Great Britain, the Texans import British manufactured goods, not only for their own consumption, but partly, also, for the supply of the N. states of Mexico. Indeed, Santa Fé has been, since 1825, the great emporium of N. or New Mexico; and in it the traders of that country meet those of the U. States; the former purchasing the manufactures brought by the latter with peltry and bullion, so that a good deal of specie reaches

the U. States by this route. The annual amount of the trade at Santa Fé was estimated, in 1834, at 2,000,000 dollars; and, in 1841, Iken estimated it at 3,000,000 dollars. Most of the articles for this trade are purchased in Philadelphia, whence they are transported overland to Pittsburgh, where they are shipped for St. Louis, being thence conveyed in waggon to Santa Fé, which they reach after a journey of at least 4,000 m. From St. Louis to Santa Fé, about 1,200 m., the road is extremely bad, running through a country so infested by hostile Indians, that the U. States government is obliged usually to send an escort of cavalry with the larger caravans: Indeed, 200 dragoons were sent in 1839, for the protection of one body of traders! (*Kennedy*.) But Santa Fé is only 600 m. from the Texan coast, so that it may not unreasonably, perhaps, be anticipated, that eventually Galveston, and other Texan ports, will be the principal routes by which European goods will reach N. Mexico. As already stated, a good deal of Texan cotton wool is exported to Europe from New Orleans, in which it is brought by way of the Red River, without its appearing to be the growth of Texas. The total export of cotton direct from the latter in 1846, amounted to 15,304 bales; in addition to which, hides, deer, otter, beaver, and other skins, cattle and other stock, and bullion from Mexico, are the principal articles of export. Money is very scarce in Texas: not one sale in ten is made for cash; and Mr. Iken is entitled to credit for recommending "shippers to be cautious as to the extent of their consignments, and to recollect that however great the commercial prospects of the country may be, it is at present only a new market, whose own consumption must necessarily be limited, and the channels of whose interior or transit trade, are as yet but very partially opened." (*Id.* pp. 66, 67.)

The duties on most manufactured goods imported into Texas are nominally 45 per cent.; but, being paid in a depreciated paper currency, do not actually exceed 10 per cent. Books, farming and other tools and utensils, wearing apparel, and French wines, are mostly imported duty free. The same rules and regulations observed on the importation of goods into the U. States are observed in Texas, consular certificates being, however, dispensed with. The currency weights, &c. are similarly calculated, except that land measures and a few others are identical with those of Mexico. The principal Texan ports of entry are Galveston, Matagorda Bay, and Aransas, to all which pilots are attached. Vessels of about 250 tons, or not drawing more than 10 or 11 ft. water, are the best suited to the trade. (*Iken's Texas*, &c.) The tonnage duties on merchant ships in the Texan ports are 60, and those on steamers 30 cents per ton.

Texas is an integral, and not, like the U. States, or Mexico, a federal republic. The president is elected for 3 years, and is not again eligible for a similar term. In other respects the constitution generally resembles that of the U. States. The legislative power is vested in the congress, composed of a senate, and a house of representatives. The latter body consists of not less than 40, nor more than 100 members, who are annually chosen by universal suffrage, and each of whom must be at least 25 years of age, and have resided in the co. or district which he represents for the 6 months next preceding his election. The senators are annually chosen by districts as nearly equal in free pop. as practicable, and are not less than 1-3d or more than half the number of representatives. One-third of their number is replaced annually. Ministers of religion are ineligible to a seat in either house of congress. All members of the government are paid for their services: the president's salary is 10,000 dollars a year, and that of members of congress 8 dollars a day, during session. A bill passed by a vote of 2-3ds of the members of the legislature becomes law without the sanction of the president; and congress reserves to itself the right of declaring war, levying imposts, contracting loans, &c. The executive power is in the hands of the president, assisted by the vice-president, both of whom must be full 35 years of age, and have been inhab. of the republic for 3 years preceding their election. The different branches of public business are conducted by 12 committees of 5 members, each appointed by the legislature.

Texas is subdivided into 3 great departments; those of Bexar in the S., Brazos in the centre, and Nacogdoches in the N.; and at present into about 40 counties. It is further divided into 7 judicial districts, in each of which is a judge. The judges are appointed by congress, and hold office for 4 years. The salary of the chief justice is 5,000 dollars; and of the district judge, 3,000 do. The supreme court consists of the chief justice of the republic and the judges of each district; and sits at Austin on the second Monday in each year, continuing in session till all the business before it be disposed of. Assize courts, courts of probate, justices' courts, &c. are held in each county; the common law of England, together with the acts of congress, having been adopted as the law of the land.

The towns are incorporated on the plan of the United

States, the principal being Austin, Galveston, Houston, Bexar, Goliad, Matagorda, and Santa Fé. The last has a pop. of about 7,000; Houston and Galveston about 5,000 each. Freedom of the press, and the free exercise of religion, are guaranteed. Slavery is permitted; and the number of negro slaves in 1840 was estimated at 11,300, since which there has been some increase. Most of these slaves have been brought from the United States by the planters from that country who have settled in Texas; and, as already stated, the importation of slaves from elsewhere is declared to be piracy punishable with death. Unreasonable or cruel treatment of a slave is punishable by a heavy fine. According to Iken, there are several schools and colleges in Texas; Sunday-schools, bible, temperance, &c. societies are already numerous; 12 newspapers were regularly published in Texas in 1841, and few free inhabs. are unable to read and write. (P. 78, 79.)

The present military force is chiefly composed of volunteer troops and militia, whose services are sometimes required against the Comanches, and other hostile Indian tribes of the N. and W. The navy consists of a sloop of war, 2 frigates, an armed steamer, several schooners, &c. The public revenue, derived from a land tax of  $\frac{1}{4}$  to 1 per cent. on its estimated value, custom duties, licences, &c., amounted in 1840 to 802,054 dollars, which is said to have considerably exceeded the expenditure. The public debt is stated by Kennedy to have been, according to the last accounts, 5,893,000 dollars.

Previously to 1630, Texas formed a remote and merely nominal part of the conquests of Cortez, inhabited almost wholly by predatory Indian tribes; but in that year the Spaniards, having driven out a colony of French who had established themselves at Matagorda, made their first permanent settlement at San Francisco. On the consummation of Mexican independence, Texas was constituted one of the federal states of Mexico, in conjunction with the adjacent state of Coahuila; a union very unpopular with the Texans, and which was productive of the first disagreement with the central government. The war of separation commenced towards the end of 1835, and on the 21st of April, 1836, the independence of Texas was finally secured by the defeat of the Mexican president, Santa Anna, at San Jacinto. (For further particulars, we beg to refer the reader to *Kennedy's Texas*, 2 vols. 8vo., and the shorter compendium of Iken; from which works we have derived most of the statements in this article.)

TEXEL (THIR), an island belonging to Holland, at the entrance of the Zuyder-Zee, off the point of the Helder, at the N. extremity of the prov. of North Holland, from which it is separated by the channel, about 2 $\frac{1}{2}$  m. across, called Mars-Diep. Its most southerly point being in about lat. 53° 1' N., long. 49° 46' E. It forms a canton of the arrond. Alkmaar; length N.E. to S.W. 13 m., and where broadest nearly 6 m. in width. Pop. from 5,000 to 6,000. It is low, and in part marshy, but is defended from the irruptions of the sea, partly and principally, by a line of *dunes*, or sand-banks, which extend along the W. coast, and partly by strong dykes. The district of Eyerland (country of eggs), so called from the vast numbers of eggs deposited by the sea-fowl on its shores during the breeding season, was formerly a distinct island, having been united to the Texel by a dyke in 1630. The soil, which is extremely fertile, is mostly employed in the feeding of cattle and sheep, the latter being of a peculiarly fine long-woolled breed. The inhabs., who occupy a town, Burg, in the centre of the island, and some villages, in addition to agriculture, engage in fishing, boat-building, &c., and act as pilots. There is an excellent roadstead on the E. coast of the island, which is the usual place of rendezvous for merchantmen from Amsterdam, waiting for a favourable wind to leave the Zuyder-Zee. The number of sand-banks make the approach to the island difficult; and on the W. side it is all but inaccessible.

During a tremendous storm in February 1825, the sea broke through the dyke by which the island is defended, and laid a large portion of its surface under water, destroying great numbers of cattle and sheep, and otherwise occasioning a heavy loss of property. The breach, however, was soon after repaired, and it is now supposed to be better protected than ever.

Several naval engagements have taken place off this island. Of these, the most celebrated was that between the Dutch fleet under the famous admiral the senior Tromp, and the English fleet under Monk, afterwards Duke of Albemarle, on the 31st of July, 1653. The action was maintained with the utmost vigour on both sides, till the death of Tromp, who was shot through the heart by a musket-ball, decided it in favour of the English. (*Buchting, Geographic Universelle*, xiv. 137. Fr. ed. of 1779; *Dict. Géographique*; *Campbell's Lives of the Admirals*, li. 35. ed. 1766.)

THAME, or TAME, a market-town and par. of England, co. Oxford, hund. Thame, on the Thame, a tributary of the Thames, 12 m. E. Oxford. Area of par.

5,310 acres. Pop., in 1831, 2,885. The town consists of three principal streets, uniting in a spacious market-place. It has also a market-house, over which is the town-hall. The par. church, a large well-built cruciform structure, comprises a nave, two aisles, a N. and E. transept, a chancel, and has a fine embattled tower, supported by four meagre pillars. The interior is of noble proportions, and contains numerous monuments, but is ill laid out, and spoiled by irregular galleries, &c. The united living of Thame, Powersey, Tetsworth, and Sydenham (two vicarages and two curacies), worth 300*l.* a year, is in the gift of a Long, Esq. Near the church are some remains of the prebendal house of Thame, now occupied by offices belonging to the parsonage farm; and in Thame Park, about 1 m. S.E. the town, considerable portions of an ancient Cistercian monastery adjoin the mansion. In 1558, Lord Williams established a free school, "of noble dimensions," at Thame; it is open to all boys of the par. and in trust of the warden and fellows of New College, Oxford, who nominate the master, subject to the approbation of the Earl of Abingdon. It had a high character during the 17th century, but is now much fallen off. Another free school, an almshouse for five poor people, and various annual donations for the poor, exist here. The pop. is mostly agricultural; in the making by women and children is the only manufacture. The Thame being navigable for barges, promotes the traffic of the town, and the market is well supplied with corn and cattle. Thame is supposed to have been a Roman station, and was of some consequence in the time of the Saxons, and during the civil wars of Charles I. The famous constitutional lawyer, Sir John Holt, Chief Justice of the King's Bench, was a native of this town, where he first saw the light in 1612. Market, on Tuesday; fairs, Easter Tues. and Old Michaelmas day, for cattle, &c. (*Revenues of England, Wales, Oxfordshire*, &c.)

THAMES, a river of England, being the largest in that part of the U. Kingdom, and, in a commercial point of view, the most important in the world. It rises in Gloucestershire, being formed by the junction of the Isis, Lech, Coln, and Churnet, rivulets which have their sources in the Cotswold Hills. The first, which is the most important, rises on the borders of Wiltshire, a little to the S.W. of Cirencester: it flows E. by Cricklade; and, being augmented by the other streams, the combined river takes the name of Thames, and becomes navigable for barges at Lechlade, on the confines of Gloucestershire and Berkshire. Its course is thence N.E., till, being further augmented by the Windrush and the Evenlode, from the borders of Gloucestershire, it turns, a little to the N. of Wytham-house, to the S. After passing Oxford, it bends suddenly to the W. by Neneham Park to Abingdon. Having again resumed its southerly direction, it is joined, a little below Dorchester, in Oxfordshire, by the Thame.

This latter river has several sources, of which the most remote are in the central part of Buckingham, near Kreslow and Wendon Lodge. They unite at Thame in Oxfordshire, from which point, to where it joins the Thames, it is navigable.

It may here be proper to state, that, according to the common opinion, the Thames obtained its name (said to be Thame-Isis, shortened to Thames) from the junction of the Thame with the Isis, or with the river coming from Gloucestershire. Probably, however, this opinion, notwithstanding its apparent accuracy, has no good foundation. At all events, it appears to be abundantly certain that the river which passes Lechlade, formed by the junction of the rivulets already referred to, has from a very remote period been called the Thames; and that the name Isis, given to it by the literati of Oxford, is not mentioned in ancient charters or by ancient historians, and is wholly unknown to the common people in the country through which it flows. (*Campden's Britannia*, Gibson's edition, l. 100; *Campbell's Political Survey*, l. 133.)

From Wallingford, a little below the influx of the Thame, the river flows almost due S., till, passing Basildon Park, it turns E. to Reading, where it is joined by the Kennet; it then flows N.E. to Great Marlow; thence S. to Maidenhead, and S.E. by Windsor and Staines, till it receives the Wey. Its course is then E., with many bold sweeps, to London; and flowing through the metropolis, and being augmented by the Lea from Hertfordshire, and the Darent, it continues its course E. till it unites with the sea at the Nore light, 45 $\frac{1}{2}$  m. below London Bridge.

The distance from London Bridge to Lechlade, where the Thames becomes navigable, following the windings of the river, is 146 $\frac{1}{2}$  m.; the total rise from low-water mark at the former to the latter being about 258 ft. This ascent is overcome by means of several locks, constructed at different periods, of which the first is at Teddington, 18 $\frac{1}{2}$  m. above London Bridge; this, consequently, is the limit to which the tide flows. The low-water surface of the river, from Teddington Lock to London Bridge,

falls about 16 ft. 9 in., or about 103 in. a mile at an average. The high-water mark at Teddington is about 1 ft. 6 in. above the high-water mark at the bridge; and the time of high water is about two hours later. The average fall in the bed of the river, from Teddington to London Bridge, is about 1 ft. a mile; the breadth of the river at London Bridge is 692 ft.

Though not a rapid, the Thames is by no means a sluggish river; it rolls forward with an equable and steady current, and is remarkable for the purity of its waters. It has been admirably described by Denham, in his *Cooper's Hill*:—

"Though deep, yet clear; though gentle, yet not dull;  
Strong without rage; without effort flowing, full."

But it is as a navigable and commercial river, having London on its banks, and bearing on its bosom numberless ships fraught with the produce of every country and every climate, that the Thames is principally distinguished. Its depth of water is so great, that, as a shipping port, London enjoys peculiar advantages; even at ebb tide there is from 12 to 13 ft. water in the fair way of the river above Greenwich; and the mean range at the extreme springs is about 22 ft. The river is, in fact, navigable as far as Deptford for ships of any burden; to Blackwall for those of 1,400 tons; and to the St. Katherine's Docks, adjoining the Tower, for vessels of 800 tons. As already stated, it is navigable by barges to the confines of Gloucestershire; and the navigation is thence continued by canals through Cirencester and Stroud to the Severn; but the usual water communication between London, Bath, and Bristol is by the Kennet, which unites with the Thames at Reading. The conveyance of goods by this channel usually occupies about seven days; and the navigation is besides exposed, particularly between Reading and London, to much interruption from droughts, floods, &c. The whole course of the river, from its source to the Nore, is reckoned at from 235 to 210 m.

The removal of the old London Bridge has caused a considerable change in the river above, and also, though in a less degree, below the bridge. Owing to the contracted arches through which the water had to make its way at the old bridge, there was a fall of from 4 ft. 9 in. to 5 ft. at low water; this fall is now reduced to about 2 in.; so that the low-water line above the bridge is nearly 5 ft. lower at spring tides than formerly. In consequence, a greatly increased body of tidal water flows up and down the river; and as it meets with no obstruction, it flows with a decidedly greater velocity. The effect of this is to scour and deepen the channel of the river; its influence in this respect being already sensibly felt as far up as Putney Bridge,  $\frac{7}{8}$  m. above London Bridge. The shores above the latter, that were formerly foul and muddy, are now becoming clean shingle and gravel, and, near low water, the beach is quite hard and firm. The shoals are also decreasing below the bridge; and there can be little doubt that the change will, at no distant period, be felt from the Nore up to Teddington.

Before the removal of the old bridge, a barge, starting from the pool with the first of the flood, could not get farther than Putney Bridge without the assistance of oars. But, under similar circumstances, a barge now reaches Mortlake, 4 m. farther up, before using oars, and, with a little help, she may reach Richmond, and, taking horses there, may get to Teddington in a tide. The descent down the river has been equally facilitated; the mean velocities of the flood and ebb, between London Bridge and Westminster Bridge, a e, flood, 3 m. an hour, extreme,  $3\frac{1}{2}$ ; ebb,  $3\frac{1}{4}$  m., extreme,  $3\frac{1}{2}$ .\*

Of the tributaries of the Thames, the Kennet, Wey, Lea, and Darent only are navigable, and are, therefore, the only ones that we need notice.

"The Kennet swift, for silver eels renowned,"

rises on Marlborough Downs, in Wiltshire, and, pursuing an easterly course, falls into the Thames at Reading. It has been made navigable as far as Newbury; whence the canal previously mentioned is carried, by Devises and Bradford, to Bath and Bristol. The Wey falls into the Thames near Otford; it has its source in the eastern part of Hampshire, and has been rendered navigable from Godalming to the Thames, a distance of about 20 m. The first navigation locks used in England are said to have been constructed on this river. The Lea rises in the chalk hills near Luton, in Bedfordshire; and, preserving a southerly course, falls into the Thames near the East India Docks. It has been made navigable, by collateral cuts and otherwise, as far as Hertford. This navigation, which is of considerable importance, began to command the attention of the legislature so early as 1425, in the reign of Henry VI. It has not yet, however, received all the improvement and extension of which it is capable. (*Priestley on Inland Navigation*, &c., p. 411.) The Darent has its source near Westerham, in Kent; it falls into the Thames about 4 m.

\* We are indebted for these details to John Smeaton, Esq., engineer.

below Dartford, to which it is navigable. (*Statistics of British Empire*, 1. 30.)

THANET (ISLE OF). See KENT.

THAXTED, a market-town and par. of England, co. Essex, hund. Dunmow, on the Chelmer, near its source, 34 m. N. E. London. Area of parish, 5,890 acres. Pop. in 1831, 2,253. The town is irregularly built, and, excepting its church, has no public edifice worth notice: this is a large and fine structure in the perpendicular style, its earliest existing part probably dating from the middle of the 14th century. It is built cathedral-wise, with a transept between the nave and chancel: its internal length is 183 ft.; breadth, 87 ft.; and at its W. end is a tower, with a very rich crocketed spire, 181 ft. in height. The whole fabric is embattled and supported by strong buttresses, terminated by canopied niches and pinnacles, curiously purfled. The N. porch is richly ornamented with sculpture, and the cornice and upper part charged with various figures. Above the entrance are two esculineons, one containing the arms of France and England, and the other those of the House of York; a part of the edifice having been constructed at the expense of Edw. IV., the last, chiefly at that of the noble families of Clare and Mortimer. "The nave is curious, being not so wide as either of the aisles. Most of the buttresses of the aisles are enriched with panelling, and have fine pinnacles. Some of the windows are square-headed; their tracery has been much mutilated. This church had, at one time, a considerable portion of fine stained glass, which has, however, long been gradually diminishing." (*Rickman, Gothic Architecture*.) The living, a vicarage, in the gift of Lord Maynard, is worth 450*l.* a year. Thaxted has meeting-houses for several sects, a par. school for 50 children, an endowment of nearly 4,000*l.*, by Lord Maynard, in 1698, for general charitable purposes, and many minor charities. It was a mun. bor. till the reign of James II., when, on the corporate officers being served with a *quo warranto*, its privileges were dropped; and its former guildhall is now the workhouse. The town is of high antiquity, its church being mentioned in the time of Edw. the Confessor. Markets on Fridays; fairs, Monday before Whits, and Aug. 10., for horses, &c. (*Parl. Reports*, &c.)

THEBES, THEBE\*, or DIOSPOLIS (the city of Jupiter), a once famous, but long ruined city of Upper Egypt, the cap. of the kingdom of the Pharaohs when in the zenith of their power, and whose remains exceed in extent and magnificence all that the most lively imagination could figure to itself. The ruins are situated in about lat. 26° 43' N., long. 32° 39' E., in the narrow valley of the Nile, stretching about 7 m. along both banks of the river, and extending to the mountains on either side. One might suppose, seeing the vast magnitude of its public edifices, that its private buildings would be in a corresponding style of magnificence; but Diodorus tells us that the Egyptians were little solicitous in respect of the latter; and at all events, all traces of private fabrics have disappeared; and temples, palaces, colossal statues, obelisks, and tombs, alone remain to attest the wealth and power of its inhabs. Thebes was undoubtedly one of the most ancient, as well as one of the greatest and most splendid of cities. Its most flourishing period was probably from about anno 1700 to anno 700 B.C. Homer has alluded to her in terms which, but for the ruins, might have been deemed extravagant:—

"Not all proud Thebes' univall'd walls contain;  
The world's gr. art' confines on the Egyptian plain—  
That spreads her conquest o'er a thousand states,  
And pours her heroes through a hundred gates;  
Two hundred horsemen and two hundred cars  
From each wide portal issuing to the wars."

Pope's *Iliad*, ix. lin. 500.

Modern travellers have not been able to find any distinct traces of walls round the ruins; and the opinion has prevailed from a very remote epoch, that Homer, in the passage now referred to, did not allude to gates in the city walls, but to the gates of the different temples, or, as Pomponius Mela supposes, to the palaces of great men (lib. i. cap. 9.). Probably, however, the poet, by this expression, merely meant to convey a lively idea of the prodigious pop. and power of the city.

The seat of government had been removed from Thebes to Memphis (near Cairo), previously to the invasion and conquest of Egypt by the Persians under Cambyses. This event took place anno 525 B.C., when, according to Diodorus, the Persians plundered and set fire to Thebes. It appears, however, to have, in some degree, recovered from this disaster. But after the conquest of Egypt by the Greeks, their whole attention was directed to the improvement and embellishment of Alexandria, so that the cities in Upper Egypt, and especially Thebes, progressively declined in importance and pop. Its fall was accelerated by its having revolted against Ptolemy Philopater, by whom it was subsequently reduced, and

\* It has been supposed that the word *Thebe* is derived from the Egyptian word *Thabki* (the city).

given up to military execution. In Strabo's time it was only partially inhabited. In the earlier ages of the Christian era it was still of some little consequence; but for these many centuries it has been only inhabited by a few wretched Copts and Arabs, who, with bats and owls, occupy miserable hovels, mostly in the courts, and sometimes on the roofs of the ancient structures.

The principal ruins on the E. or Arabic side of the river are those of Carnac and Luxor, about 1½ m. apart. The first of these, which there can be no doubt is the temple of Ammon, the Jupiter of the Egyptians, is described by Diodorus as a vast structure, or rather collection of structures, the principal being erected on an artificial elevation. It has various entrances, the avenues to which have been flanked on each side with rows of sphinxes. The principal front to the Nile is of enormous magnitude, being 368 ft. in length by 148 ft. in height, with a doorway in the middle 64 ft. in height. Entering this superb gateway, and passing through a large court, we pass between two colossal statues through another propylon, entering by a flight of steps to a vast hall, the roof of which, consisting of enormous slabs of stone, has been supported by 134 huge columns. This gigantic hypostyle hall is about 338 ft. in width, by 170½ ft. in depth, so that its area comprises 57,629 sq. ft., being considerably more than 1½ acre, or more than 5 times the area of St. Martin's church, Trafalgar Square, London; and yet this magnificent hall does not occupy one seventh part of the space included within the walls of the temple! (*Egyptian Antiquities; Library of Entertaining Knowledge*, i. 89.) The entrance to what is supposed to be the adytum of this famous temple is marked by 4 noble obelisks, each 70 ft. in height, but of which 3 only are now standing. "The adytum consists of 3 apartments, entirely of granite. The principal room, which is in the centre, is 20 ft. long, 16 wide, and 13 high. Three blocks of granite form the roof, which is painted with clusters of gilt stars on a blue ground. The walls are likewise covered with painted sculptures of a character admirably adapted to the mysterious purposes mentioned by Herodotus, on the subject of the virgins who were introduced to the Theban Jupiter. (*Herod.* i. 182.) Beyond this are other porticoes and galleries, which have been continued to another propylon at the distance of 2,000 ft. from that at the W. extremity of the temple." (*Hamilton's Egyptica*.)

The great temple is supposed to have had 4 grand entrances, one fronting each of the cardinal points. Deducting its porticoes or propyla, the length of this stupendous structure, measured on the plan of the French savans, is 1,215 ft., and its least breadth 321 ft.; so that its area must be rather above 9 acres! And "besides the great edifice, with its propyla, obelisks, and avenues of colossal sphinxes, it has magnificent temples to the N. and S., altogether forming an assemblage of remains such as, perhaps, no other spot on earth can offer." (*Egyptian Antiquities*, i. 94.)

Champollion says, with reference to the ruins of Carnac, "La m'apparut toute la magnificence Pharaonique, tout ce que les hommes ont imaginé et exécuté de plus grand. Tout ce que j'avais vu à Thèbes, tout ce que j'avais admiré avec enthousiasme sur la rive gauche, me parut misérable en comparaison des conceptions gigantesques que j'étais entouré. Il suffira d'ajouter qu'aucun peuple, même à moderne, n'a conçu l'art d'architecture sur un échelle aussi sublime, aussi large, aussi grandiose, que le firent les vieux Égyptiens: ils concevaient en Europe de 100 pieds de haut; et l'imaginaient qui, en Europe, s'élevait bien au dessus de nos portiques, s'élevait, et tombe impuissante au pied des 140 colonnes de la salle hypostyle de Karnac." (*Lettres Ecrites de l'Égypte*, &c., 98.)

The palace of Luxor (*El kusr*, the ruins) about 1½ m. S. from Carnac, on the same side of the river, though inferior in size to the latter, is also a structure of vast dimensions. Its principal entrance facing the N. is most magnificent. On either side the doorway stood two obelisks, or monoliths, each formed out of a single block of red granite, 80 ft. in height, about 8 ft. square, and most beautifully sculptured. Recently, however, one of these obelisks has been taken down and conveyed at an immense expense to Paris, where it has been erected in the Place de la Concorde; but it is as little in unison with the objects among which it is now placed as a Pharaoh would be in the court of the Thuilleries, and it is to be regretted that it should have been separated from the venerable structure of which it formed so splendid an ornament. Between the obelisks and the propylon are two colossal statues, each measuring about 44 ft. from the ground. The entire palace is about 800 ft. in length, by about 200 ft. in breadth. It is in a very ruinous state; but though most part of the outer walls have been thrown down, the greater number of the columns in the interior are still standing. It is sadly encumbered with the hovels of the modern Copts and Arabs, and with the accumulated filth and rubbish of centuries. The victories of Sesostris are sculptured on the

B. wing of the propylon and on other parts of the palace with infinite spirit, and the greatest amplitude of detail. "It was impossible," says Mr. Hamilton, "to view and reflect upon a picture so copious and detailed, without fancying that I here saw the original of many of Homer's battles, the portrait of some of the historical narratives of Herodotus, and one of the principal groundworks of the stories of Diodorus; and to complete the gratification, we felt that, had the artist been better acquainted with the rules and use of perspective, the performance might have done credit to the genius of a Michael Angelo or a Giulio Romano. Without personally inspecting this extraordinary edifice, it is impossible to have any adequate notion of its immense size, or of the prodigious masses of which it consists. In both these respects, and, combined with them, in respect to the beauty and magnificence of its several parts, it is, I should imagine, unrivalled in the whole world." (*Egyptica*, 121.) This palace is supposed to have been founded by Amenophis Memnon, about anno 1650 B. C.

The ruins on the W. or Libyan side of the Nile are not less interesting than those on its E. side. About 2,500 ft. from the river are two sitting colossal, each about 50 ft. in height, and seated on a pedestal of corresponding dimensions. The probability seems to be, that the most northerly of these colossal is the statue of Memnon, which has obtained an immortality of renown, from its being believed to have emitted a sound when it was first struck by the rays of the morning sun! (See Vol. I. 751.) Champollion has, however, shown, from the hieroglyphics on its back, that this famous statue really represents the Pharaoh Amenophis II., who reigned about anno 1680 B. C. These statues are supposed, by the same distinguished authority, to have decorated the facade of the principal front of the celebrated structure, the *Amenophion* of the Egyptians, and Memnonium of the Greeks. But if such be really the case, the destruction of this building has been incomparably more complete than that of any one else of the famous structures belonging to the city; and it is now, indeed, next to impossible to form any thing even like a ground plan of the ruins. (*Lettres d'Égypte*, 307.)

Between Medinet-Abou and Kournak are the remains of a noble building, about 530 ft. in length and 240 ft. in breadth, supposed by some to be the tomb of Osymandus, described by Diodorus, but which has been more generally supposed to be the Memnonium. Champollion, however, has shown that neither of these suppositions is correct; and that it was built by, and hid in fact between the residence of Rhamses the Great, or Sesostris, the most illustrious of the Egyptian monarchs. The *Rhamession*, for such is its proper name, is very much dilapidated; but its immense and noble proportions, and the beauty of its sculptures, make it one of the most interesting, as well as magnificent, of Theban structures. Between the propylon and the front of the palace, a distance of about 56 paces, are the fragments of a stupendous colossal statue of Rhamses the Great. It has been broken off at the waist, and the upper part is now prostrate on the ground. This enormous statue measures 63 ft. round the shoulders, and 13 ft. from the crown of the head to the top of the shoulders. The barbarian energy exerted in its destruction has been such, that nothing of the general expression of the face can now be discerned; and, as Mr. Hamilton has truly stated, "Next to the wonder excited by the boldness of the sculptor who made it, and the extraordinary powers of those by whom it was erected, the labour and exertions that must have been used for its destruction are the most astonishing." (P. 167.)

It would be to no purpose, even did our space permit, to attempt giving any account of the innumerable hieroglyphics, pictorial tablets, and bas-reliefs on the ruins of the Rhamession. They principally relate to the triumphs of its illustrious founder, and his adoration of the gods of his country. The author of *Scenes and Impressions in Egypt* alludes as follows to the representation of the victories of Sesostris:—"The hero, as compared with the rest of the figures, is of great size; he stands erect in his chariot; his horses on their speed—a high, cloud-pawing gallop; his reins drawn to the head; the reins fastened round his loins; you have the flight of the vanquished; the headlong fallings of the horse and the chariot; you have the hurrying crowd of the soldiers on foot; a river; drowning; the succouring of warriors on the opposite bank; and, in a compartment beyond, you have a walled town; a storm; the assailants climbing ladders; the defenders on the parapet; the upheld shield; the down-thrust pike; a sad but yet a stirring picture, bringing to your mind many a historic scene, alike memorable and melancholy." (P. 95.)

The following, according to Champollion, is the dedication of the great hall of the palace, sculptured in the name of the founder, in beautiful hieroglyphics, upon the architraves of the left side:—

"HAROU, all-powerful, the friend of truth, the lord of the upper and lower regions, the defender of Egypt,

the castigator of countries; Horus, the resplendent possessor of the palms, the greatest of conquerors, the king-lord of the world, sun, guardian of justice, approved by Thér, the son of the Sun, the well-beloved of Ammon; Rhamssa, has caused these structures to be erected in honour of his father Ammon-Ra, king of the gods. He has caused to be constructed in good white sandstone the great hall of assembly, supported by large columns with capitals imitating full-blown flowers, and flanked by smaller pillars with capitals imitating a truncated bud of the lotus; and he has dedicated the hall to the Lord of Gods, for the celebration of his assemblies: this is what the king ever living has done." (*Lettres d'Egypte*, p. 273; we have used the translation given in the art. on *Egypt* in the new ed. of the *Encyc. Britannica*.)

The tombs of the kings of Egypt in the valley or rather rocky ravine of Biban-el-Muluk, to the S.W. of the ruins on the W. side of the river, are not less extraordinary than the structures previously noticed. They have been described as follows in the elaborate and learned article on *Egypt* now referred to:—

"The site chosen for the royal necropolis appears to be eminently suited to its melancholy destination; for a valley or ravine, encased as it were by high precipitous rocks, or by mountains in a state of decomposition, presenting large fissures, occasioned either by the extreme heat or by internal sinking down, and the backs of which are covered by black bands or patches, as if they had in part burned, is a spot which, from its loneliness, desolation, and apparent dreariness, harmonises well with our ideas as to the most fitting locality for a place of tombs. No living animal, it is said, frequents this valley of the dead; even the fox, the wolf, and the hyena, shun its mournful precincts; and its doleful echoes are only awakened at intervals by the foot of the solitary antiquary, led by inquisitive curiosity to pry into the very secrets of the grave. The catacombs, or *hypogææ*, are all constructed on nearly the same plan; yet no two of them are exactly alike; some are complete, others appear never to have been finished, and they vary much in the depth to which they have been excavated. In general, the entrance is by the exterior opening of a passage 20 ft. wide, which descends gradually about 50 paces, then expands, whilst the descent becomes more rapid, and is continued for some distance farther. On either side of this passage is a horizontal gallery, on a level with the lowest part of the first descent; at the interior extremity there is a spacious and lofty apartment, in the centre of which is placed the royal tomb; and beyond this there are commonly other small chambers at the sides, whilst in some cases the principal passage is continued a long way into the rock. The royal tomb is for the most part a sarcophagus of red or grey granite, circular at the one end, and square at the other; but where there is no sarcophagus, a hole or grave is discovered, cut in the rock to the depth of from 6 to 30 ft., and which appears to have been covered by a granite lid. Almost all the lids, however, belonging to the graves excavated in the rock, have either been removed or broken. In those sepulchres which have been finished, the walls from one end to the other are all covered with sculptures and paintings, executed in the best style of ancient art; and owing to the unparalleled dryness of the atmosphere in Egypt, the colours, where they have not been purposely damaged, are as fresh as when first laid on. The labours of Belzoni in exploring these tombs, and the success with which they were rewarded, are well known. Strength and resolution as herculean and inflexible as his were required to overcome the suspicions of the Arabs, the want of mechanical aid, and the heat and closeness of the caverns; but his perseverance was amply recompensed by the discovery of six tombs in this hypogæan city of the dead. The most remarkable of these, with all its galleries, is upwards of 300 ft. in length, and is called by Belzoni the tomb of Apia, from his having found the mummy of a bullock in one of its chambers. In another apartment was a magnificent sarcophagus of white alabaster, almost as transparent as crystal; and the whole excavation, sculptured and painted in the most finished style of art, was in the most perfect preservation. These catacombs, as already stated, were the sepulchres of the kings of the three Diospolitan dynasties; and accordingly, by means of the hieroglyphical inscriptions, Champollion discovered the tombs of six kings of the 18th dynasty; that of Amenophis-Memnon, the most ancient of all, in an isolated part of the valley towards the W.; and, lastly, those of Rhamssa-Memnon, and six other Pharaohs, his successors, belonging either to the 19th or 20th dynasty. No sort of order, either in regard to dynasty or succession, appears to have been observed in the choice of situations for the different royal tombs; on the contrary, each sovereign seems to have caused his own to be dug wherever he found a vein of stone adapted for the purposes of sculpture and the immensity of the projected excavation. The royal cata-

combs, however, which have been thoroughly completed and finished, are but few in number: these are, the tomb of Amenophis III., or Memnon, the decoration of which has been almost entirely destroyed; that of Rhamssa-Memnon; and of Rhamssa V.; probably also that of Rhamssa the Great; and, lastly, that of Queen Thaisos. All the others are incomplete. The tomb of the great Rhamssa, or Sesostris, still exists, according to M. Champollion, and is the third on the right of the principal valley; but it has sustained greater injury than almost any other, and is filled nearly to the ceiling with rubbish."

Such is a very brief and imperfect notice of some of the more important ruins scattered over the site of this ancient capital of the Pharaohs—"*veterum Thebarum magna vestigia*." (*Taciti Annal.*, lib. ii. cap. 70.) Their vastness is such as almost to stagger belief; and the traveller who finds himself among these gigantic monuments of remote antiquity feels an almost overpowering sensation of astonishment and awe. It is extremely difficult to form any apparently satisfactory conclusions as to the means which the Theban monarchs must have put in motion to raise such stupendous edifices. Their extraordinary magnitude, the size and hardness of the blocks of stone (usually granite) of which they are built, and the countless numbers, depth, and nicety of the hieroglyphics and pictorial tablets with which they are profusely covered, must have occasioned the employment of an enormous quantity of labour, and an all but boundless expense. Most probably the work was principally executed by slaves, or by requisitions of compulsory labour furnished by subjugated countries; but, in whatever way it may have been effected, it must, especially when we consider the limited advance then made in mechanical science, have involved an outlay which only a very great revenue could have sufficed to meet.

It is impossible to form any just idea of what Thebes must have been in the days of her glory, previously to the Pharaohs leaving her palaces for those of Memphis, while her porticoes were crowded with merchants and merchandise, and before

"Relentless war had pour'd around her wall."

Thebes had little in common with most ancient and still less with most modern cities. She in fact was, as it were, the capital of a by-gone world, of which we know little or nothing save what may be learned and conjectured from her own monuments.

THEBES, a famous city of ancient Greece, the capital of Boeotia. The modern town is, however, of comparatively limited dimensions, being confined to the eminence occupied by the Acropolis of the ancient city, and the pop. is supposed not to exceed 5,000. It is the cap. of a prov. of the same name, and is situated in a fine plain 23 m. N.N.W. Athens, lat. 38° 22' 30" N., long. 23° 45' 15" E. When seen from a distance, the modern town still assumes the appearance of a considerable city. Prodigious ramparts and artificial mounds appear on its outside; it is surrounded by a deep fosse; and the traces of its old walls may yet be discovered. But the contrast between its external and internal appearance is most striking. Previously to the late revolution, the streets were narrow and dirty, the houses being either constructed of the ruins of ancient edifices, or mere wooden hovels. It had, however, some handsome mosques and minarets, with a bazaar shaded by gigantic plane trees, and extensive gardens; but these have been almost wholly destroyed during the late struggle. The town, however, is again beginning to be rebuilt, and Mr. Mure says that "the principal street is of considerable width, with some good new houses on each side, interspersed with the usual number of hovels, wooden sheds, ruins, and rubbish." (*Tour in Greece*, i. 260.) It retains very few traces of its ancient magnificence, and the sacred and public edifices mentioned by Pausanias and others have wholly disappeared. It is now, however, as of old, extremely well supplied with excellent water.

The ancient city of Thebes, or rather its citadel, is said to have been founded by Cadmus (and hence called *Cadmicia*), a Phœnician, or perhaps Egyptian, adventurer, who introduced the knowledge of letters into Greece, anno 1549 a.c. (*Larcher, Chronologie d'Hérodote*, p. 569.) Its walls were constructed at a later period by Amphion and Zethus, the former of whom is believed to have been the earliest of Greek musicians, and hence

"Dictus et Amphion, Thebæ conditor aris,  
Sicæ movere sono testudinis, et præce blandâ  
Ducere quo vellet." *Hor. Art. Poet.* lib. 3rd.

The city had seven gates; its circ. is variously stated at from 43 to 70 stadia, and its pop. might perhaps amount to about 50,000. It had many magnificent temples, theatres, gymnasia, and other public edifices, adorned with noble statues, paintings, and other works of art. Its government, like that of all other Greek cities, was fluctuating and various. Originally it was subject to kings or tyrants; and after the republican government had been established, the aristocratical and democratical

\* This article was written by the late Dr. Brown of Edinburgh, and is a favourite specimen of his great learning and research.

parties alternately prevailed. Owing to her proximity to Athens, from which, of course, she had everything to fear, Thebes was for a lengthened period what may be called the natural enemy of Athens, and during the Peloponnesian war was the most efficient ally of Lacedæmon. But after the failure of the expedition against Syracuse had broken the power of Athens, and Thebes had no longer any fear of her hostility, discussions began to spring up between her and Lacedæmon, and the Thebans, under their great leaders Pelopidas and Epaminondas, acquired a decided superiority over the latter, and became for a short while the leading Greek state.

After the battle of Cheronea, in which the Thebans bore a principal part, Philip placed a garrison in the citadel of Thebes; but, on his death, the Thebans rose in arms against his son, Alexander the Great. The latter, however, having taken the city by storm, anno 335 B.C., rased it to the foundations, the house that had been occupied by Pindar being alone excepted from the general destruction; such of the inhabs., amounting, it is said, to 30,000, as had not been killed, being at the same time sold as slaves. (See *Mifford's Greece*, vii. 339., 8vo. ed., and the authorities there quoted.)

But about twenty years after this catastrophe, the city was rebuilt by Cassander, when the Athenians, forgetting the ancient animosities that had subsisted between them and the Thebans, generously contributed towards the reconstruction of its walls. Subsequently the city underwent many vicissitudes. It appears to have suffered from the exactions of Sulla. Strabo calls it a poor village (lib. ix.); and Pausanias, who describes its temples and other remains, says, that, with the exception of the temples, the lower town was wholly destroyed. (lib. ix. cap. 7.) The fertility of the surrounding plain, which produces corn, wine, and oil in the greatest abundance, and the excellence of the air and water, appear to have been the principal cause why Thebes has been able to survive so many disasters, and is still a considerable and increasing town.

Thebes is particularly famous in the early and heroic ages of Greek history. "*Nec cedentes Athenis claritate, que cognominantur Bæotie Thebes, ædorum numinum, Thebæ tunc Herculis, ut voluit, patria.*" (Plin. Hist. Nat. lib. iv. cap. 7.) The stories, also, of Lains, Jocasta and Œdipus, and their unfortunate progeny, and of the wars of the seven chiefs and their descendants, the Epigoni, against Thebes, have supplied topics of the deepest interest that have engaged the attention of the greatest poets of antiquity and of modern times.

The air of the Boeotian plain is less pure than that of Attica, and this circumstance was pretty generally believed in antiquity to be the cause of the dulness of the Thebans, who, speaking generally, wanted the quickness, penetration, and vivacity, that distinguished the Athenians. But this difference of character was probably owing rather to a difference in the education and institutions of the two people than to any difference of soil or climate. In respect of illustrious men, Thebes need not fear a comparison with any city of ancient or modern times. The names of Ilesodotus and Pindar, of Pelopidas and Epaminondas, are alone sufficient to illustrate and ennoble a nation. It was, indeed, as already stated, the extraordinary talents and virtues of the latter that raised his country to a preponderating influence in the affairs of Greece. It deserves, also, to be mentioned, to the honour of the Thebans, that the odious practice, tolerated in other Greek states, of exposing children at their birth, was forbidden in Thebes. (In addition to the authorities already referred to, see *Clarke's Travels*, vii. 61., &c., 8vo. ed.; *Dodwell's Greece*, i. cap. 9.; *Voyage d'Anacharsis*, cap. 34.; *Antient Universal History*, vi. p. 189—200., &c.)

THEISS (an. *Tibiscus*), a great river of Hungary, being the most important of the tributaries of the Danube, parallel to which it flows in the lower part of its course through the great Hungarian plain. It has its sources in the Carpathian Mountains, on the confines of the Bukowina, within a short distance of the sources of the Pruth, in about lat. 48° N. long. 24° E., being formed by the junction of two streams, the Black and the White Theiss. Its course, which throughout is extremely tortuous, is first generally W.N.W. to Tokay, from which point it flows with innumerable windings, S.S.W. and S., till it enters the Danube, nearly opposite to Salankemen, in lat. 48° 10' N. long. 20° 23' E., after a course of at least 500 m., taking only its more important windings into account, for the greater part of which it is navigable. It constitutes the line of separation between 2 of the 4 great divisions of Hungary, thence called Hungary-on-this-side (or N. and W.), and Hungary-beyond (or S. and E.) the Theiss. Its chief tributaries are the Bodrog, Schajo, with the Hernad, and Zagaya on the right, and the Szamos, Körös, Maros, &c., with the other principal rivers of Transylvania, on the left. The area of its basin is estimated by Berghaus at upwards of 6,000 sq. m. (*All. Länder*, &c., iv. 766.) The traffic on the Theiss is at present

mostly confined to the conveyance downwards of salt (from the co. Marmaros, in which it rises), and of timber in rafts. "Hitherto no steam-boat has been established on the Theiss; but from the extreme richness of the surrounding country, the size and importance of many of the places on its banks, and above all from the exceedingly bad roads in its neighbourhood, there can be little doubt that the establishment of steam navigation will be undertaken before long. The depth, width, and force of the stream of the Theiss are as favourable as could be desired; but it is objected that the windings of the river require to be cut off by canals; and in some cases 30 or 40 miles would be saved by a cut of 3 or 4. Should the canal be formed between the Danube at Pesth and the Theiss at Szoluck, as is contemplated, this river will assume an importance far greater than it is at present imagined. The slow muddy waters of the Theiss seem to suit the fish better than those of any other river in Hungary. It is said that, after an overflow, they have been left in such quantities as to be used for feeding the pigs, and manuring the ground. The sturgeon of the Theiss, though smaller than that of the Danube, is remarkable for its fitness and delicate flavour." (*Page's Hungary and Transylvania*, i. 478, 479.)

THEIKMOPYLÆ (from *theikos*, hot; and *πύλη*, a gate, or pass); a famous defile on the shore of the Mallian Gulph, on the N.E. coast of Greece, near the mouth of the Helioda (an. *Sperchius*), between the steep precipices at the E. termination of Mount Ōtæ, and the sea, in about lat. 38° 52' N. long. 22° 39' E. The defile is about 5 m. in length, and, where narrowest, was not, anciently, more than 60 paces across. *In cæcis valle ad Malicæum sinum vergente iter est non latius quam scægula passus. Hæc una militaris via est, qua traduci exercitus, si non prohibeantur, possunt.* (Liv. lib. xxx. cap. 15.) At present the only practicable road through the strait is by a narrow causeway, on either side of which is an impassable morass, bounded on the one side by the mountains, and on the other by the sea. This pass is now, as in antiquity, the principal, and, indeed, almost the only road by which Greece can be entered from the N.E.; and as it may be defended by a comparatively small force, its occupation is of the utmost importance for the defence of the country. At the narrowest part of the pass are hot springs, a circumstance which, as seen above, has given the defile its peculiar name. (*Clarke's Travels*, vii. 317., &c., 8vo. ed.)

It was in this pass, as every body knows, that, anno 480 B.C., the Spartan king Leonidas, with about 4,000 Greeks, resisted for a while the whole force of the Persian army invading Greece under Xerxes. After the Persians had succeeded in opening a passage by another route across the mountains, Leonidas, having dismissed almost all the other Greeks, devoted himself with 300 Spartans, in obedience to the laws, which forbade Spartans, under whatever disadvantage, to fly from an enemy, and, agreeably to the answer of the oracle, a sacrifice to insure the independence of his country. (*Herodotus*, lib. vii. cap. 210—228.) This event has given Thermopylæ all its interest and will make it be remembered as an everlasting remembrance." After the final defeat of the Persians a magnificent monument, the ruins of which still remain, was erected in honour of Leonidas and his heroic companions. It had an inscription, said by Cicero, by whom it has been translated, to have been written by Simonides (*Tuscul.*, i. cap. 42.), and which has been rendered into English, as follows:—

"To Lacedæmon's sons, O stranger, tell  
That here, obedient to their laws, we fell!"

The ground near the Sperchius, on which the army of Xerxes was encamped during the attack on Thermopylæ, could not possibly have accommodated his troops had their numbers approached to anything like those specified by Herodotus. But there cannot be so much as the shadow of a doubt that these are grossly, and, indeed, ludicrously, exaggerated. To suppose, as is stated by the venerable father of history, that the army which Xerxes led to Thermopylæ and his fleet comprised 5,283,220 troops, sailors, and male followers of all descriptions (*Herod.* lib. vii. cap. 187.), exclusive of women, eunuchs, &c., is a palpable absurdity. It may be confidently affirmed that no such force ever was brought together, and that if it were it could neither be fed nor kept together for the shortest period. If we estimate the troops, seamen, and other followers of all kinds employed by Xerxes in this expedition at 500,000 individuals, we shall certainly be not within, but far beyond, the mark.

The statements of Herodotus are founded merely on rumour, which is always sure to exaggerate that which is really great; and the Greeks were particularly prone to magnify their exploits beyond all reasonable bounds.

THETFORD, a par. and mun. bor. of England, chiefly in the co. Norfolk but partly in Suffolk; being separated by the little Ouse into 2 unequal parts, connected by an iron bridge, constructed in 1829, at the intersection of the roads from Newmarket to Norwich, and

from Rottesdale to Lynn; 26 m. S.W. by W. Norwich, and 70 m. N.E. London. Area of par. bor., which comprises the 3 pars. of St. Cuthbert, St. Mary, and St. Peter, 8,270 acres. Pop., in 1881, 3,462. The town is straggling, and irregularly built, with little trade or manufactures; but it does not appear to be decaying, and has a clean and respectable appearance. It is not paved, lighted, nor watched. It has increased of late years very little beyond its former limits. (*Bund. and Mun. Cor. Rep.*) St. Peter's, called the "black church," from being constructed mostly of flint, was principally rebuilt in 1789; it is provided with buttresses, battlements, &c. The living is a rectory, worth 55*l.* a year. St. Cuthbert's and St. Mary's (which last par. is in Suffolk), are both perpet. curacies, the former worth 50*l.* and the latter 83*l.* a year. All the livings are in the gift of the Duke of Norfolk. The guildhall is a fine old building, erected in the time of Charles II. The market-house, roofed with iron, is a tall, large built-in contrived building; the brewer's, workhouse, several dissenting chapels, and theatre, are occasionally opened, are the other principal buildings. An hospital for two poor men and two women, and a free grammar school, were established in the reign of James I.; and it has besides, almshouses founded in 1680, a national school, funds for apprenticing poor children, and many minor charities. Thetford is governed by a mayor, 3 other aldermen, and 42 councillors: its earliest extant charter is of William III. It has no commission of the peace, but petty sessions and a court of record are held weekly. The corp. revenue is principally derived from the tolls on navigation from Thetford to White House ferry, under local acts; gross amount in 1840, 637*l.* Thetford has sent 2 mems. to the H. of C. since the reign of Edward VI.: previously to the Reform Act the right of voting was vested in the mayor, burgesses, and commonalty. The limits of the par. bor. were not affected by the Boundary Act. Reg. electors, in 1835-40, 160. The town is a polling place for the W. div. of Norfolk. Thetford is generally supposed to occur the site of the *Sitomagus* of the Romans. During the II. plan by it was the cap. of the East Anglian kingdom, and on the E. side of the town are remains of intrenchments, &c., supposed to date from that period. In the time of Canute a convent was founded in the town, some remains of which are still extant. The gateway, &c., of a priory, founded in 1104, and some traces of a monastery, established at a later period, may also be seen. In the reign of Edward III., it is said to have had 21 principal streets, 5 market-places, 20 churches, 8 monasteries, and 6 hospitals, besides other public foundations; but these statements are of doubtful authenticity, and are most probably much exaggerated. It has been occasionally visited in more modern times by some of the British sovereigns, particularly James I., who had a hunting-seat in the neighbourhood. Among the natives of Thetford who have attracted notice, the most celebrated by far was Thomas Paine, author of the once famous but now forgotten pamphlets entitled "Common Sense," "Rights of Man," "Age of Reason," &c. Paine was born on the 29th of January, 1737; his father, who was a stay-maker in Thetford, belonged to the Quakers. Markets, Sat., fairs, May 14, Aug. 2 and 16, for sheep; Sep. 25, for cattle, cheese, and toys.

THIBET, or TIBET (native *Tou'p'ho*, *Bhot*, and *Puê-koachim*, "snowy region of the north"), a very extensive region of Central Asia, mostly comprised within the Chinese empire, between lat. 22° and 31° N. and long. 72° and 104° E., having N. Chinese Turkestan and the Desert of Gobi; E., the Chinese prov. of Se-tchuen; S., Yun-nan; N., Birmanah, and the Great Himalaya, separating it from Assam, Bootan, Sikim, Nepal, and the upper British provs.; and W. the Punjab territory, N. of the Himalaya, Budukh-shan, the Beeloot Tagh Mountains, &c. The W. parts of this vast tract, called Little Thibet (including Ladakh, Lé, Baltes, &c.), appear, however, to be independent of China. Its boundaries on every side but the S., being so uncertain, and our knowledge of the country so limited, it is impossible to form any thing like an accurate estimate either of its area or pop. Thibet, though it does not include the highest summits of the Himalaya, comprises a large portion of the elevated table land in the centre of the continent, with the sources of almost all the great rivers of S. Asia, including the Indus, Sutlej, Ganges, Brahmaputra, Irrawadi, Than-lweng, and Menam-kong or river of Cambodia, as well as those of the great Chinese rivers, the Yang-tse-kiang, and Hoang-Ho. Its mountain-chains generally run parallel to the Great Himalaya, of which Thibet is the N. slope; but some are said to stretch in a N.E. direction to the frontiers of Koko-nor, and others extend from N. to S. between the valleys of the great rivers in the S.E. Thibet has numerous lakes; the chief are the Tengki-nor, the largest, about 110 m. N.W. Lassa, and the Koko Fato or Yaino-rouk, S. of the San-po river, which surrounds in the form of a ring a large island of a shape similar to its own. (*Chinese Dic-*

According to Mr. Turner, there is a very striking contrast in the face of the country in passing from Bootan into Thibet. "Bootan presents to the view mountains covered with perpetual verdure, and rich in forests of large and lofty trees, while not a slope or narrow slip of land between the ridges lies unimproved. Thibet, on the other hand, strikes a traveller at first sight as one of the least favoured countries under heaven, and appears to be in a great measure incapable of culture. It exhibits only low rocky hills, without any visible vegetation, or extensive arid plains, both of the most stern and stubborn aspect, promising full as little as they produce. Its climate is cold and bleak in the extreme, from the severe effects of which the inhabs. are obliged to seek refuge in sheltered valleys and hollows, or amidst the warmest aspects of the rocks. Yet the advantages that the one country possesses in fertility and in the richness of its forests and fruits, are amply counterbalanced in the other by its numerous rocks and invaluable mines. As one seems to possess the pabulum of vegetation, in the other we find the superabundance of animal life. The variety and quantity of wild-fowl, game, and beasts of prey, deer, droves, and herds in Thibet, are astonishing. In Bootan, except domestic creatures, nothing of the sort is to be seen." (*Turner's Thibet*, &c., p. 216.)

The same division of the seasons prevails here as in Bengal. The spring, from March to May, is marked by a variable atmosphere, heat, thunder-storms, and occasionally refreshing showers. From June to Sept. is the damp season, when heavy and continued rains throughout most parts of the country swell the rivers, which bear off the surplus waters to augment the inundation of Bengal. From Oct. to March a clear and uniform sky succeeds, seldom obscured either by fogs or clouds, and for the first three months of this season a degree of cold is felt, among the lofty mountain ranges of the S., far greater, perhaps, than is known to prevail in Europe. This region is remarkable, at all seasons, for the dryness of the winds, and meat and fish are prepared for carriage to any distance, and will keep in any season of the year, by being dried up by exposure to the frosty air. Vegetation is frequently dried to brittleness, and every plant may be rubbed between the fingers into dust. (*Turner*, p. 303.)

Goutte, syphilis, and smallpox appear to be the most severe diseases in Thibet, and, unfortunately, are very prevalent. Syphilis is said, by an English surgeon, to make a more rapid progress, and rage with more violence here than in any other country. (*Saunders*, p. 410) Catarrhs and rheumatism are more frequent than in Bengal.

Of the geology of Thibet we have only scattered notices. Moorcroft found that the hills in parts of Little Thibet consisted apparently of clay-stone, fragments of granite, quartz, &c. being strewn upon their sides. (*Moorcroft's Travels*, i. 439.) The latter rocks, with primary limestone, talc, and similar formations, seem to enter most largely into the mountain ranges, where they are often interspersed with beds of clay and sand, and occasionally of chalk. Tincal is obtained in inexhaustible quantities; rock salt is met with in many parts, and nitre effloresces abundantly on the surface of the soil. Gold is found in lumps and irregular veins, or in the form of dust in the rivers, and is frequently of great purity. There are mines of lead, silver, copper, and cinnabar, but few if any of iron, though chalybeate springs are very frequent. The difficulty of procuring fuel for smelting the less valuable ores proves an insuperable obstacle to success in mining; timber of all kinds is rare, and the dung of animals is the only substitute for fire-wood. The discovery of a coal mine would be an invaluable acquisition to Thibet.

The usual crops are, barley, coarse pease, and wheat. The first grows by far the largest proportion of the whole; wheat never enters into the food of the poorer classes, and rice is not cultivated. A brief notice of the agriculture and vegetable products of Little Thibet will be found under the article *LADAKH* (*ante*, p. 131.). Turnips and radishes are almost the only garden vegetables, and fruits are of little variety. For most vegetable products, and, indeed, medicinal plants, Thibet is dependent on Bootan, Nepal, and the other countries S. of the Himalaya.

Among the useful animals of Thibet, sheep merit a distinguished rank. The flocks of these are numerous; and upon them the chief reliance of the inhabs. is placed. A peculiar variety, which seems indigenous to the country, is of small size, with black heads and legs, and soft wool; their mutton, which is almost the only animal food used in Thibet, being said by Mr. Turner to be the finest in the world. The sheep are occasionally employed as beasts of burden, being laden with salt, grain, &c. They are the bearers of their own coats to the best markets, where the wool is usually made into a narrow cloth resembling frieze or thick coarse blanketing. The skins of both sheep and lambs are commonly cured with the

wool on; and, in order to secure a silky softness of the fleece, the ewes are sometimes killed before their time of yearning, when their skins bear a high price in China and all over Tartary. (Turner, p. 302.) The Thibet goat (*Capra hircus*), which affords the valuable material for the shawl manufacture, feeds, like the sheep, in large numbers together. These are perhaps the most beautiful among the whole tribe of goats. Their colours are various; black, white, of a faint bluish tinge, and of a shade something lighter than a fawn. They have straight horns, and are of a lower stature than the smallest sheep in England. The material used for the manufacture of shawls is of a light fine texture, and clothes the animal next the skin. A coarse covering of long hair grows above this, and preserves the softness of the interior coat. The creature is, no doubt, indebted for the warmth and fine quality of the latter to the nature of the climate and country it inhabits. On removing some of the goats to the hot atmosphere of Bengal, Turner says they quickly lost their beautiful clothing, and a cutaneous eruptive lamour soon destroyed almost all their coat. He was also unsuccessful, after repeated trials, in attempting to acclimatise the animal in England. (Turner's Thibet, p. 396.) Recently, indeed, the Thibet goat has been naturalised in France; but it is quite certain, from the great difference of the climate, that the wool will, in no long time, lose all its distinguishing and most valuable qualities. The most valuable species of cattle is the yak, or grunting ox (*Ox grunniens*), which is also indigenous to the country. Their cows supply an abundance of rich milk; they are very useful as beasts of burden, and throughout Hindostan their busby tails are in great request as chowries to drive away flies, &c. For agricultural labour, small cattle, like those of Bengal, are chiefly employed. Most of the native animals of Thibet, as the hare, blaral (*Ovis ammon*), dog, &c., have long furry coats. Among the wild animals, perhaps the most curious is the musk deer, which delights in excessive cold. It is about the height of a moderately-sized hog, which it closely resembles in the figure of the body. It has a small head, a thick and round hind quarter, no tail, and extremely delicate limbs. The hair with which it is covered is prodigiously copious, and grows erect all over the body, in some parts to between two and three inches in length, thin, flexible, and undulated. Its colour at the base is white, in the middle black, and brown at the points. The musk is a secretion formed in a little bag at the navel, and found only in the male. The musk deer, valuable for this product, is deemed the property of the state, and is hunted only by permission of government. (Turner, p. 206.)

At the end of the last century, the valley of Jhansu in Thibet was particularly famous for the manufacture of woollen cloth, for which there was an extensive demand. The cloths, which were confined to two colours, garnet and white, seldom exceeded half a yard in breadth, and were woven very thick and close. A good deal of cloth is also said to be made at Lassa, great quantities of a red colour being annually exported into China. Moorcroft describes the process of weaving at Piti, in Little Thibet, as follows:—"The two ends of the warp are fastened together, and it is then stretched upon two rods, one fixed to the body of the weaver (who is invariably a woman) by a cord, which admits of the work being loosened or tightened at pleasure, and the other well fastened to some stones at a distance, equal to half the length of the cloth. The whole is close to the ground, on which the workwoman sits, but the portion close to her is slightly elevated by a third rod; loops, each including a thread, and received upon a small stick like a rattan, supply the place of a heddle: of these there are three sets, which draw up parts of the warp alternately as required. A large heavy mesh, into which a thin bar of iron is inserted, is a substitute for the reed, and three or more heavy strokes are made with its armed edge upon every thread of the wool. The last instrument must be taken out after the insertion of each piece of yarn, and when placed perpendicularly, with its two edges separating the warp, abundance of room is given for the passage of the hells of worsted made use of without the covering of a shuttle. This part of the process is tedious, but the warp is prepared in a quick and simple way: several pegs are driven into the ground, so near each other that the whole may be reached without any material movement of the body: the yarn is fastened to one of them, and carried on round the others till a sufficient quantity has been wound; all are then taken out except three, which have their places supplied by rods, and the warp only requires spreading. Every woman knows how to weave, but only half their number may be considered as employed in the manufacture, for if a house contain two, one is usually busy in domestic affairs. 26,000 yards, 17 inches wide, may be fabricated annually in the Piti district, of which about half is exported. Further N. a coarse loom is in use, not very unlike that common in Europe. Several varieties of cloth are manufactured; some thick and heavy, with a long nap, others fine. All the wool used is of a

coarse kind, and in consequence the finer cloths have a hardness, something similar to that of camel or plaid, to which they are little inferior. Very good sackings is also made of the hair and wool from the yak. (Moorcraft, Trav., p. 71-74.)

Thibet has, from time immemorial, been a country of considerable traffic; but here, as in Bootan, foreign trade is monopolised by the government, and a few of the first officers of state. The commerce is principally with China, the Chinese trade being carried on partly at Sin-ning, a garrison town on the W. frontier of China, and partly at Lassa, by caravans, which come there in October. These consist of 600 or 600 persons, who bring goods on cattle, mules, and sometimes horses, exchanging tea, silver bullion, brocades, fruits, &c., for fine and coarse woollen cloths, gold dust, and Bengal goods. The imports from China are large. Turner was informed, that in the territory of Tesboo Loomboo tea to the value of 60,000, or 70,000, sterling was annually consumed, and Bootan is supplied with tea from Thibet. The other imports from China are tobacco, quicksilver, cinabar, furs, porcelain, musical instruments, European cutlery, pearls, coral, &c. From Bootan and Bengal Thibet receives English broad-cloths, piece goods, Allahabad cloth, kimcoats, coarse sugar, tobacco, indigo, paper, rice, sandalwood, spices, gums, and other skins. Many of these articles come through Nepal, which receives all its Chinese imports through Thibet. The trade with Assam is very limited, but small quantities of rice, coarse silk, iron, stick lac, &c. are imported; from Turkestan come horses and camels. From Ladakh E. Thibet receives dried fruits, shawls, gamboge, saffron, &c. The general returns of Thibet are in gold dust, silver, tincal, musk, woollen cloths, goat and lamb skins, and rock salt; the goats' hair is almost all sent through Ladakh to Cashmere for the manufacture of the Cashmere shawls. (See vol. I. p. 592. of this Dict.)

Moorcroft says that in Little Thibet traffic is carried on chiefly by barter, and money is almost unknown. Salt, wool, turquoises, sheep, and goats, are imported from Chan-than, or Chinese Thibet, and are paid for with grain, woollen cloth, and horses. From Bisahar and Kulu (to Piti) come iron, cooking utensils, brass, copper, tobacco, rice, dried fruits, tea-cups, timber, amber, &c., paid for in a similar way. The iron and metal vessels of the S. are sent to L., in exchange for tea, coarse cloth, coral, and dyeing drugs. (Trav. 71.) Further details respecting the trade of Little Thibet will be found in the art. LADAKH (ante, p. 131.).

The modes of conveyance in Thibet differ altogether from those of Bootan. In the latter all species of goods are carried on the shoulders of the people, chiefly the females: in Thibet, they are conveyed by the chowry cattle, horses, mules, and asses. The horses, which are very docile, are not natives of Thibet, but mostly brought from Turkestan, after having been carefully emasculated, to prevent their propagating their species.

China has been justly celebrated for her magnificent bridges and public works, but Thibet is far from sharing in this celebrity. Over one river, crossed by Mr. Turton, was constructed a long bridge, upon 9 piers, of very rude structure. "The piers were composed of rough stones, without cement; but to hold them together, large trees, with their roots and branches, had been inserted; and some of them were vegetating. Slight beams of timber were laid from pier to pier; and upon them large flat stones were loosely placed, that tilted and rattled when trod upon; and this, I fear, is a specimen of their best bridges. Many were extremely dangerous to pass over." (P. 229.) The boats, also, used to cross the rivers are of a very rude kind; some are made chiefly of leather, consisting of a rude skeleton of wood, with thwart and ribs, over which a bull's hide is stretched.

The country is politically divided into Wei and Tsang, or Hither and Farther Thibet. Wei is that division bordering on China, having for its cap. Lassa, or H'lassa, the residence of the Dalai Lama. It is divided into 8 cantons, that of Lassa being the principal; and 39 feudal townships, called *toozes*, which lie northward, contiguous to some similar townships in the country of Koko-nor. Tsang, or Ulterior Thibet, is W. of the former, and extends W. from about long. 90° E. It is divided into 7 cantons, its cap. being Tesloo-Loomboo. These 2 provs. are under the direction of two ministers, sent from the imperial cabinet at Pekin; and of two high priests of Thibet, called Dalai Lama and Bantchin-erendi. The ministerial residents govern both provs. conjointly, consulting only with the Dalai Lama for the affairs of Hither, and with the Bantchin-erendi for those of Farther Thibet. All appointments to offices of government and titles of nobility must be approved by the Chinese officers. But in minor matters the residents do not interfere, leaving such affairs to the secular deputies of the high priests, called *Dzeds*. The government of the 39 feudal townships in Hither Thibet, and of the Lamuh or Dan Mongols inhabiting the N. frontier, is entirely in the hands of residents. (Chinese Repository, i. 174.) Two officers,

natives of the country, are sent to each canton from Lassa, and relieved every three years. The subordinate management of the communities is intrusted to two officers in each, the *d'heba* and *vatir*, the former appointed from Lassa, the latter a native of the place, who, with the chief lama of the village, form a sort of local council, dependent on the provincial authorities; who again are obliged to refer to the capital for instructions in all extraordinary cases. (*Moorcroft*, i. 365.)

Thibet is remarkable as being the central seat and headquarters of Buddhism, where the Buddhist religion is preserved in its greatest purity. The whole nation is divided into two distinct and separate classes, those who carry on the business of the world, and those who hold intercourse with heaven. No interference of the laity ever interrupts the regulated duties of the clergy, nor do the latter ever employ themselves in secular affairs. In this, and in the absence of castes, consist some of the most striking differences between the religion of Thibet and that of Hindostan, all distinction of caste being utterly repudiated by the Buddhist faith. The priests of Thibet are all called *lamas*; and the Grand, or Dalai Lama, who resides at Lassa, is believed by his adherents to be an incarnation of the Divinity in a human form. On the dissolution of this body, he is supposed to reappear in the body of some infant, who subsequently passes through the term of his mortal existence with all the honours of the Grand Lama. The mode of ascertaining the identity of the new lama is described at length in Hamilton's *E. I. Gazetteer*, art. THIBET. The Teshoo Lama, and others, are also supposed to be divine incarnations, occupying successively different bodies; and Turner (p. 333-336.) gives an amusing account of an interview with the former, who, although only 18 months old, appears to have conducted himself with astonishing dignity and decorum! The Buddhists of Thibet have convents for men and women, and their religious institutions present several striking coincidences with those of the R. Catholic church.

The written laws of Thibet, which are said to be of high antiquity, have in recent times been modified in accordance with those of China. Robbery or dacoity is usually punished by perpetual banishment; murder by death. Adultery is not classed among serious criminal offences; and strict chastity before marriage is not expected in the fair sex. In Thibet, as in Bootan and other countries of the Himalaya, the practice of *polyandria* is common; a female associating herself with all the brothers of a family, without restriction of age or numbers. The choice of the wife is the privilege of the elder brother.

The people of Thibet belong to the great Tartar family. Their physical appearance has been already noticed in this work (see *Asia*, l. 192.). They are said to be mild and humane, but their intellect is sluggish, and they have never exhibited the enterprise of their neighbours either to the N. or S. As Dras, in W. Thibet, Moorcroft found the pop. much addicted to pilfering; but he says that this is not the character of the people in general, especially of those who follow the faith of Buddha: the people of Dras are Mohammedans, and like those of Ladakh generally, have suffered much moral detriment from contact with the Cashmerians. (*Travels*, ii. 43.) In this part of Thibet the houses are built of pebbles, cemented with earth, having terraced roofs, without chimneys. Further E. the peasants' dwellings are mean structures, resembling brick-kilns in shape and size, and built of rough stones heaped upon each other without cement. The great scarcity of timber in Thibet prevents the higher class of inhabs. from boarding the floors of their rooms, which are accordingly of stone or marble. Bedsteads appear to be wholly unknown; the general custom is to spread on the floor, by way of a bed, a thick mattress, which serves for a seat by day. Both sexes dress chiefly in woollens, in which yellow and red are predominant colours, with upper garments of sheep, goat, or jackal skins, and high and thick boots, but the upper classes partly in silk, and in cloaks lined with sable or other furs. Their food principally consists of barley, variously prepared, with tea, spirits, beer, and mutton, which last they prefer raw. Their meals are taken at no stated times, but under the impulse of hunger. The business of the day usually begins by prayer; they then follow their peculiar avocations till evening, which is always spent in recreation, music and dancing being among their principal amusements. Mr. Turner found the priests acquainted with the signs of the zodiac, the satellites of Jupiter, Saturn's ring, &c.

The art of printing has also, from a very remote age, been practised in Thibet. But no improvements appear to have been made in this country in any branch of science known to the inhabs. Their mode of printing has probably been derived from China; but they esteem the city of Benares as the traditional source of both their learning and religion. (*Turner*, p. 281.) There appears to have been from the remotest time a connexion

between Thibet and India; and the *uchen* character, in which the sacred writings of this people are preserved, bears a strong resemblance to that of the Sanscrit. The *umia*, or ordinary character of business and correspondence, is distinct from the former.

Several remarkable customs prevail in Thibet. In every visit of ceremony, a silk scarf, usually white, and with the mystic sentence *Dom mane pace me om* interwoven at both ends, is invariably exchanged at every visit of ceremony, and accompanies every letter sent between people of every rank and station in life. "This usage," says Turner, "is observed in all the territory of the Deb Rajah (Bootan); it obtains throughout Thibet; it extends from Turkestan to the confines of the Great Desert; it is practised in China, and I doubt not, reaches to the limits of Mantchoo Tartary." Another custom, which the people share with the Parsees, is that of exposing the bodies of the dead among the laity to be devoured by carnivorous birds. The bodies of sovereign lamas after death are dried by exposure to the air, and preserved enshrined; those of inferior lamas are usually burnt, and their ashes inclosed in little metallic idols. Other corpses are committed to the rigors; but the inhumation of the dead is totally unknown.

Thibet appears to have had relations with the Chinese empire at a very early period; but it was governed by its own princes till about 1720, when the emperor Kang-he acquired its sovereignty. Still the greater share of power was left in the hands of the Grand Lama till the invasion of the Nepal Gorkins in 1790; when, on their expulsion by the Chinese, the present form of government was established, and strangers, formerly permitted to enter the country, were altogether excluded. (*Note in Chinese Repository*, l. 175; *Turner's Embassy to Thibet*; *Moorcroft's Trav. in the Himalayan Provs.*, &c.)

THIELT, a town of Belgium, prov. W. Flanders, arrond. Bruges, cap. cant., a little S. of the railway between Bruges and Ghent, 13 m. S.S.E. the former. Pop., in 1836, including commune, 11,500. It has no government establishments or public buildings of any consequence; but it is a busy and flourishing town, with manufacture of leather, hats, soap, and lace, being indebted for its prosperity to its situation near a tributary of the Lys, which gives it the advantage of a considerable inland navigation. It unites with Poperingen in sending 3 mems. to the provincial states. Among the natives of Thielt was Oliver Leduin, the barber, and afterwards the favourite, of Louis XI. This unworthy minion, who figures as an important personage in Scott's novel of *Quentin Durward*, did not escape the fate due to his deserts, having been hanged, in 1484, after the death of Louis.

THIERS, a town of France, dep. Puy de Dôme, cap. arrond., on the Duirolle, 23 m. E.N.E. Clermont. Pop., in 1836, 6,907. The appearance of the town is picturesque, being situated on the declivity of a hill, and tolerably well built; but its streets are narrow and steep, and its vicinity is so arid and bare that the inhabs. have been always obliged to depend mainly on their manufacturing industry. It has considerable fabrics of hardware and cutlery, and of woollens, paper, leather, &c. It is the seat of tribunals of primary jurisdiction and commerce, a chamber of manufactures, a council *des prud'hommes*, and a communal college. It owes its origin to a castle existing here in the earliest period of the French monarchy, and is supposed to derive its present name from Thierry, King of Metz, early in the 6th century. (*Hugo*; *Dict. Géog.*, &c.)

THIONVILLE, a fortified town of France, dep. Moselle, cap. arrond., on the Moselle, 16 m. N. Metz. Pop., in 1836, 4,201. It is, in general, well built; and, unlike most fortified towns, has broad streets. It is entered by 3 gates, and communicates with its citadel across the river by a wooden bridge. It has a handsome *place d'armes*, three sides of which are occupied by barracks, and the fourth by the cavalry stables, considered among the best in France. The new par. church, corn market, theatre, college, civil hospital, and the former mansion of the governor, now the sub-prefecture; the tribunal of primary jurisdiction, mayor's residence, and *gendarmerie*, with the botanic garden, are all deserving of notice. Hosiery, woollen cloths, candles, leather, liquors, and spirits, are manufactured in the town and its vicinity. The kings of France, of the first and second races, frequently resided here. After the Carolingians, Thionville successively belonged to the counts of Luxembourg, and to Burgundy, Austria, and Spain. It was repeatedly besieged and taken in the 16th and 17th centuries, but has belonged to France ever since it surrendered to the Prince of Condé, in 1643. (*Hugo*, *Guide du Voyageur*; *Dict. Géog.*)

THIRSK, a par. bor., market-town, and par. of England, co. York, N. Riding, wapent. Birdforth, on the Colldale, an affluent of the Swale (here crossed by two stone bridges), by which the town is divided into Old and New Thirsk, 22½ m. N.W. York. The par. bor. com-

prises the townships of Thirsk, Sowerby, Carlton-Miniot, and Sand-Hutton, in the par. of Thirsk, with the adjacent townships of S. Kelvington and Bagby, including an area of 9,810 acres. Pop. in 1831, 4,672. Thirsk is a country town, situated in an agricultural neighbourhood: the old town is chiefly composed of one long street of rather an unpromising appearance, at the commencement of which is a small open space. In the new town, also, the houses are, for the most part, of an inferior class, and inhabited by small tradesmen. About  $\frac{1}{2}$  m. to the S. of Thirsk is Sowerby, an extremely neat country village. Many of the houses are of a superior class, and have an air of neatness and respectability. Sowerby consists of one long and very wide street; it has been selected as a residence by many persons, who, having retired from business, live upon the produce of the capital they have accumulated. (*Bound. Rep.*) The par. church is a large and handsome edifice, in the Perpendicular style: it has a lofty W. tower, and is wholly of one design, with pierced battlements; the details are good, and the general appearance elegant. (*Rickman's Gothic Architecture.*) A part of this church is said to have been built out of the ruins of the castle, belonging to the Mowbray family, erected in the 10th and destroyed in the 12th century, on the site of which New Thirsk is partly built. The living of Thirsk, a perpetual curacy worth 143*l.* a year, is in the gift of the Archb. of York. There are several places of worship for Dissenters, charity schools, a dispensary, &c. The principal employment is the manufacture of coarse linens and sacking. Thirsk appears to be in a stationary condition. It is governed by a bailiff, chosen annually, and sworn in at the court leet of the lord of the manor. The former bor. comprised only a part of the old town of Thirsk. It sent 2 mems. to the H. of C. in the 23d Edward I., and again from the reign of Edward VI. down to the passing of the Reform Act; the right of election being in the owners of burgage tenements. The Reform Act deprived Thirsk of 1 of its mems. Reg. electors, in 1839-40, 327. Markets on Mondays. Fairs, 8 times a year for cattle, horses, sheep, and leather. (*Parl. Reps. &c.*)

THOMASTOWN, an inland town of Ireland, prov. Leinster, co. Kilkenny, on the Nore, 18 m. N. Waterford. Pop. in 1831, 2,331. The town, which consists mostly of mean houses, is principally occupied by agricultural labourers and small traders, generally in very depressed circumstances. The public buildings include the par. church, a Rom. Cath. chapel, a court-house, and a bridewell. Lighters of from 20 to 30 tons come up to the town, which has 3 large flour-mills, and exports considerable quantities of flour, corn, and provisions: it has also a tannery and 2 breweries. Thomastown sent 2 mems. to the Irish H. of C., but was disfranchised at the Union. Quarter sessions are held in January, April, July, and October; and petty sessions every alternate week. It is a constabulary station. Markets on Mondays and Saturdays. Fairs, March 17, May 25, June 29, and Sept. 15. Post-office revenue, in 1830, 284*l.*; in 1836, 605*l.* A branch of the Agricultural Bank was opened in 1835. There are several resident landlords in the neighbourhood of Thomastown, and the agriculture and trade of the country has improved. But Inglis affirms that the condition of the people has, notwithstanding, visibly deteriorated of late years (I. p. 80.), and this, we regret to say, how anomalous soever it may appear, is true of most country districts in Ireland.

THORN, a fortified town of the kingd. and prov. of Prussia, reg. Marienwerder, cap. circ., on the Vistula, here crossed by a long wooden bridge, about 90 m. from its mouth, and 52 m. S.S.W. Marienwerder. Pop., in 1838, 7,668. It consists of an old and a new town, separated by a wall and ditch. There are 3 Rom. Cath., and 2 Protestant churches; several convents and asylums, a Lutheran gymnasium, &c. It is the seat of the courts for the circ., and has various manufactures, and a considerable trade. It is very strong, its fortifications having been greatly improved and augmented since 1815. It was founded by the first grand master of the Teutonic order, in 1231; and most part of its principal edifices are of old date. But its chief claim to notice is derived from its having been the birth-place of Copernicus, the discoverer, or rather restorer, of the true theory of the world, born on the 19th February, 1473. His great work, *De Revolutionibus Orbium Caelestium*, in six books, was published at Nuremberg, in 1543, a few days before the death of its illustrious author, which took place on the 24th of May of the same year.

THORNBURY, a market-town and par. of England, co. Gloucester, hund. Thornbury, in the vale of Berkeley, 11 m. N. by E. Bristol. Area of par., 11,580 acres. Pop., in 1831, 4,376. The town consists principally of three streets, arranged in the form of the letter Y. The church is a handsome cruciform structure, with a lofty tower, ornamented with rich open-worked battlements and pinnacles. The living, a vicarage worth 500*l.* a year net, is in the gift of the dean and chapter of Christchurch, Oxford. There are two subordinate curacies in the par., at Oldbury and Fairfield. It has also Baptist, Independent,

Quaker, and Wesleyan meeting-houses; a grammar-school for boys, another free school for 36 children, almshouses, &c. But it is principally remarkable for the remains of a magnificent castle, begun by Stafford, Duke of Buckingham, in 1511, but left in an unfinished state, when he suffered on the scaffold, in 1522. Its site is very commanding; Rickman says its style is the late perpendicular, with good details; and it is especially interesting from its affording some interesting specimens of the last gradation of castellated architecture. (*Gothic Architect.*) Thornbury was formerly a municipal bor., governed by a mayor and 12 aldermen; but no charter is extant, and the body being found useless, the corporation was abolished by the Municipal Reform Act. The clothing trade was formerly carried on pretty extensively, but it is now nearly extinct. Market-day, Saturday; fairs, Easter Monday, Aug. 15, Monday before St. Thomas, and Dec. 21, for cattle and pigs. (*Mun. Report & Append., &c.*)

THORNE, a market-town and par. of England, co. York, W. Riding, wapent. Strafforth, &c., near the Don, and on the borders of Lincolnshire, in a low, flat, and mostly fertile, but marshy country, 23*½* m. S. by E. York. Area of par., 10,840 acres. Pop., in 1831, 3,779. The town appears to be prosperous; it is tolerably well built, and the streets are paved. The par. church is a neat building, with a square tower and pinnacles. The living, a perpet. curacy, worth 117*l.* a year, is in the gift of the heir of Sir H. Hotherington. (*Eccles. Res. Rep.*) There are several dissenting chapels, two free schools, &c. At a suburb called Hangman-hill, on the Don, about 1 m. from the town, vessels of considerable burden are built, and a brisk trade in corn and other goods is carried on at Thorne, which is greatly promoted by the Staithforth and Keadby Canal. Market-day, Wednesday; fairs, Monday, Tuesday, and Wednesday, after both June 11. and Oct. 11, for cattle, horses, and pedlary.

THRASYMENE (LAKE OF), or Lake of Perugia (an. *Lacus Thrasymentis*), a famous lake of Central Italy, Papal States, deleg. Perugia, 10 m. W. the city of that name. It is of a circular shape, about 30 m. in circ., has several small islands, and is rather shallow, its greatest depth not exceeding 24 ft.; it is well stocked with fish, and its bank are covered with olive plantations. Being surrounded by ramifications of the Apennines, it has no natural outlet for its waters; and in consequence, when it was swollen by rains, it was apt to overflow its banks, and damage the surrounding country. To obviate this danger, a tunnel (or *cunicularia*), similar to that of Lake Albano (see ALBANO), above  $\frac{1}{2}$  m. in length, has been cut through a hill on the S.E. side of the lake, by which its surplus waters are conveyed to an affluent of the Tiber. This useful work, if not wholly constructed, was, at all events, repaired and renovated, by a lord of Perugia in the early part of the 15th century. (*Rampoldi, Trasimeno, Lago di.*)

This lake is famous in history for the great victory gained on its banks by Hannibal over the Romans, anno 217 n. c. The battle appears, according to the statements of the best critics, to have been fought in a valley near Passignano, on the N.E. shore of the lake, which is entered from the N. by a narrow defile, and is shut up on all sides by steep hills round the lake. Hannibal having entered this defile, posted his troops at the foot and on the slopes of the hills that bounded the valley on either side, and in this position waited the advance of the Romans, by whom he was imprudently followed. The latter entered the valley at night-fall, and at break of day, on beginning their march, they were assailed on all sides with tremendous fury. The disorder caused by this unexpected attack was increased by the circumstance of a thick fog arising from the lake and concealing their enemies. But, notwithstanding they were thus, as it were, caught in a trap, the Romans displayed their accustomed bravery, and struggled, if not for victory, at least to sell their lives as dearly as possible. It is mentioned, as evincing the fury of the contest, and its all-absorbing interest, that a violent earthquake, which in great part overturned several towns of Italy, and otherwise committed great ravages, occurred during the heat of the fight without being noticed by any one! (*Livy*, lib. xxii. cap. 5.) In the end, however, the triumph of Hannibal was complete. The Romans left 15,000 men, including their consul, Flamininus, whose rashness had led them into the snare, dead on the field of battle; and, according to Polybius, they lost about the same number, taken prisoners. The loss of the Carthaginians did not exceed 1,500 men. (See *Livy*, ubi supra, and the excellent account of Polybius, *General History*, lib. iii. cap. 8.)

In noticing the lake of Thrasyment, Byron has alluded to the incident of the earthquake as follows:—

"And such the storm of battle on this day,  
And such the frenzy, whose convulsion binds  
To all save carnage, that, beneath the fray,  
An earthquake reel'd unheeded away!  
None felt stern Nature rocking at his feet,  
And yawning forth a grave for those who lay  
Upon their bucklers for a winding-sheet!

Such is the absorbing hate when warring nations meet!"

Childe Harold, iv. 63.

**THREE RIVERS, or TROIS RIVIERES**, the third town of Lower Canada, cap. distr. of its own name, on the St. Lawrence, where it is joined by the St. Maurice, 66 m. S.W. Quebec, and 75 m. N.R. Montreal; lat. 46° 28' N., long. 72° 29' W. Pop., estimated by M'Gregor at between 4,000 and 5,000. It derives its name from 2 small islands at the mouth of the St. Maurice, which divide it into 3 channels, but the town is on the W. bank of that river. The situation is agreeable, though not the town itself, which is one of the oldest in Canada. It contains about 480 dwelling-houses, mostly built of wood, a handsome court-house, a strong gaol, a decent-looking Catholic, and a Protestant church, an Ursuline convent, founded in 1677, &c. The river is deep near the town, and the steamers stop to take on board passengers and fuel. Here the courts of justice for the district are held; and here, at one period, a great share of the fur trade centred. Some furs are still brought down by the Indians, and purchased by the agents of the Hudson's Bay Company; and there are a few breweries, potash factories, inns, shops, a printing-office, &c. But its general trade has been mostly absorbed by Montreal and Quebec. (*M'Gregor's British America*, &c.)

Trois Rivières was of much more importance formerly than at present, having been originally the cap. of Canada. (*Encyc. America*.) Its pop. is still principally French, and the names of its streets are all traceable to Paris. It sends 2 mems. to the H. of Assembly.

**THURGAU, or THURGOVIA**, a canton of Switzerland, in the N.E. part of the confed., between lat. 47° 20' and 47° 40' N., and long. 8° 40' and 9° 30' E.; having S. St. Gall, W. Zurich and Schaffhausen, and N. and E. the Rhine and the lake of Constance. Area estimated at 268 sq. m. Pop., in 1837, 84,124; this being, with the exception of Geneva, the most densely peopled of the Swiss cantons. Thurgau, though it cannot be called mountainous, has a very uneven surface, consisting of low hills interspersed with narrow valleys. The canton derives its name from the Thur, which traverses it about its centre; next to which, the principal rivers are the Murg and Sittler. Agriculture is the principal occupation of the inhabs., and though the soil in certain parts requires a great deal of manure, Thurgau may, on the whole, be considered one of the most fertile cantons of the confed. There are extensive vineyards over nearly half the canton, and the value of the produce of wine, in average years, is estimated at 80,000*l.* sterling. The internal consumption may be about a fourth part of the whole quantity, the remaining three fourths being exported to St. Gall and Appenzell. Considerable quantities of fruit and cider are exported in the same directions, but the quantity sent to Germany has of late years greatly diminished. About 100,000 hectols. of wheat are raised annually, being about two thirds the consumption. Oats, hemp, flax, potatoes, and hops are the other articles chiefly raised; oats and brandy are among the exports to Appenzell. The breeding of cattle is unimportant; but a large proportion of the S. part of the canton consists of fine pasture-land, and lean cattle being imported and fattened, are subsequently exported to the neighbouring states. The possessors of landed property would seem to be in a very distressed state; for the president of the canton is said to have stated, in 1836, that its estates were mortgaged to neighbouring cantons to the amount of 960,000*l.* sterling, on which an annual interest of 40,000*l.* was paid. (*Bouring's Report*.) The wages of agricultural labour are from 4*d.* to 7*d.* per day, the master providing food, which consists of oat cakes, barley, and sometimes wheaten bread, potatoes, &c. Among the classes engaged in manufactures, the use of coffee is being introduced. The peasantry eat meat once or twice a week: their ordinary beverage is wine or cider, though beer is also brewed in the canton. The male peasantry generally dress in woollens, the females in light cotton stuffs.

The commercial interests of the canton are said to have been injured by the Prussian league; at all events the linen and cotton goods sent into Germany are much less now than formerly. Nearly one third part of the inhabs. are more or less engaged in manufacturing labour, principally in weaving cotton and linen fabrics, and spinning flax. The manufacture of linen is, however, declining, and its annual value is not now supposed to exceed 8,000*l.* a year. From 3,000 to 5,000 looms are employed in weaving cotton goods, the chief *dépôt* for which are St. Gall and Zurich. Weavers' wages range from about 7*d.* to 1*s.* 6*d.* a day. There are some rather extensive establishments for cotton printing, the prints being sent chiefly to the Levant. Silks are manufactured for the French markets; and a good deal of the packing canvass sold in Basle, Zurich, &c. is made in Thurgau.

The government, revised in 1831, is democratic. The great council of 100 mems., which has the sole legislative power, consists of the representatives of the 82 circles, into which the canton is divided, elected by all the citizens above 25 years of age who pay taxes on property to the value of 300 florins, and are not paupers, or otherwise disqualified. The great council assembles

twice a year, for 15 days at a time, unless its sessions be prolonged on special account; it is wholly renewed every two years, half the mems. going out yearly. The executive duties are intrusted to a council of 6 mems., who must be 30 years of age, and who hold office for 6 years. Two *landsmans* are chosen annually, and preside for 6 months alternately in the great and little council. Each commune has its own council, composed of the syndic, or mayor, and 4 other mems., and its police, and petty civil tribunal. There are courts of original jurisdiction in each of the 8 districts of the canton, and a supreme court of appeal, in Frauenfeld, the cap. In 1837, about 72,000 of the inhabs. were Protestants, and 18,500 R. Catholics. Public education is very widely diffused. Public revenue, in 1834, 157,920 florins; expenditure, 107,920 do.

As early as the 5th century Thurgau was governed by its own counts. It afterwards passed to the dukes of Zaeheringen, and the counts of Kyburg; and, in 1264, to the house of Hapsburg. In 1460, it was conquered from the latter by the confederated Swiss cantons, and governed by their bailiffs or prefects till 1798. It was then constituted a separate member of the confed., in which it now holds the 17th place, furnishing a contingent of 152 men to the confederate army. (*Zuphoffer, Der Kant. Thurgau; Bouring's Rep. on Switzerland; Picot Statist. de la Suisse; Echel*, &c.)

**THURLES**, an inland town of Ireland, prov. Munster, co. Tipperary, on the Suir, 77 m. S.W. Dublin. Pop., in 1831, 7,084. The river intersects the town, the communication between its different parts being maintained by a bridge. The public buildings comprise a fine Rom. Cath. chapel, which serves for the cathedral of the see of Cashel, a Rom. Cath. college, 2 nunneries, with chapels annexed, a market-house, a court-house and bridewell, and a barrack. Mr. Inglis speaks favourably of Thurles. "It cuts," says he, "some figure at a distance, owing to the new and very handsome Rom. Cath. chapel, and the unfinished Rom. Cath. college. The town stands on a wide, scantily wooded, uninteresting plain. It contains about 7,000 inhabs., and is tolerably prosperous; for, having no larger town nearer to it than 40 or 50 m., it supplies an extensive interior district, and is besides an important market for country produce. There are no fewer than 15 annual fairs and 2 weekly markets held at Thurles. I saw scarcely any beggars in the place, and the cabins in the outskirts were not of the worst kind. There are two nunneries; in one of which are 20 nuns and 60 boarders: there is also an excellent Rom. Cath. school belonging to the Rom. Cath. institution. I observed no shops to be let, and saw several houses in the course of being built. Land lets very high in the neighbourhood." (*l.* p. 107.)

General sessions are held twice a year; petty sessions on Saturdays: it is a constabulary station. Markets on Tuesdays and Saturdays. Fairs on Easter Monday, Aug. 21, Dec. 21., and first Monday of every month. Post-office revenue, in 1830, 452*l.*; in 1836, 560*l.* Branches of the National and Agricultural Banks were opened in 1835 and 1836.

**THURSO**, a sea-port town of Scotland, N. shore, co. Caithness, on the Pentland Frith, at the bottom of Thurso Bay, between Dwarick Head on the E., and Holburn Head on the W., at the point where Thurso river (here crossed by a handsome bridge) falls into the bay, 84 m. S.W. Dunnet Head. Pop., in 1841, about 2,500. It is irregularly built, and rather ill paved; but in the suburbs are some neat freestone houses and the church, built, in 1832, at an expense of 6,000*l.*, is a handsome structure: it has also a meeting-house for original seceders, an independent chapel, and several schools. A short way to the E. is Thurso Castle, the seat of Sir George Sinclair, Bart., proprietor of the town. Though the most northerly post town of Great Britain, it has a daily communication by a mail coach with Inverness and the south, and it communicates by regular traders and steamers with Leith, Wick, &c. There is a harbour at the mouth of the river for the accommodation of vessels drawing 12 ft. water; and ships of any burden may anchor on the W. side of the bay, in Scrubber Roads, under cover of Holburn Head. At present (1842) about 15 vessels belong to the port. A little straw plait is manufactured in the town; and it has also a rope-walk and some tanneries. The town has 3 magistrates, appointed by the Sinclair family, the successors of its bar. On the whole, the town may be regarded as in a nearly stationary state; and its progress has been by no means commensurate with the sanguine expectations of its late proprietor, the well known Sir John Sinclair. It is obvious, indeed, that the poor and thinly peopled country in its vicinity, and the nature of the remote and dangerous frith on which it is placed, are all but insuperable obstacles to its ever becoming of any considerable importance. (*New Statistical Account of Scotland, art. Thurso*.)

**TIBER** (an. *Tiberis*, Ital. *Tevere*), the most celebrated though not the largest river of Italy, rises in the Tuscan

Apennines, about 5 m. N. Pieve San Stefano, and has a general S.E. course to within 20 m. from Rome, when it turns S.W., and enters the Mediterranean by two mouths, 17 m. below that city, after a course of about 150 m. It is said to have been anciently navigable for vessels of considerable burden as far as Rome, and for small boats to within a short distance of its source (*Dion. Hist.*, iii. 44.; *Syrab.*, v. 218.); and it still continues to be navigable, in certain seasons, as far as the confluence of the Nera; 38 m. N.N.E. Rome; but its navigation is at all times difficult, especially at its *embouchure*, and in the vicinity of Rome, and requires continual attention. The entrance of the river from the sea, and its subsequent navigation, are, in fact, so troublesome, that the harbour of Ostia, at its mouth, was relinquished in antiquity for that of Centum-cellæ, now Civita Vecchia, which still continues to be the port of Rome, though it be considerably more than twice the distance of Ostia from the city, with which it is connected merely by a road. (See the articles CIVITA VECCHIA and OSTIA in this work.) Its principal tributaries are the Toppino, Nera, and Tevere from the E., and the Nestore, Chiana, and Nepi, from the N. and W. By the Chiana, it communicates with the Arno. Besides Rome, Borgo San Sepolcro, Città del Castello, Fratte, Orto, Otricoli, Magliana, and Ostia, are on its banks, and Perugia and Orvieto in its immediate vicinity. In antiquity the Tiber divided Etruria from Umbria, and the territories of the Latins and Sabines: at present it separates the delegs. of Spoleto and Rieti from the deleg. of Viterbo and the Comarca di Roma.

Notwithstanding its immortality of renown, its banks are not generally picturesque, and at first sight it generally disappoints strangers. It is muddy, and during the floods, to which it is very subject, verifies the description of Horace:—

"Vidimus fluvium Tiberim, retortis  
Litorè Etrusco violentè undis;  
Ire delectum monumenta regis." Od. i. 2.

But at other times it flows with a comparatively gentle current:—

"Ad terram Hesperiam venies, ubi Lydius arva,  
Inter opima virum, leni fluit agmine Tiberis."  
*Æneid*, ii. v. 781.

It was anciently called *Albula*, and this name, as well as the epithet *flavus*, given it by Horace and other writers, was no doubt derived from the yellowish hue of its waters, discoloured by the mud with which they are loaded. "Some travellers, measuring its mass of waters by its bulk of fame, and finding its appearance inferior to their preconceptions, have represented it as a petty and insignificant streamlet. However, though far inferior in breadth to all the great rivers, yet as it is generally, from a few miles above Rome to the sea, about 300 ft. wide upon an average\*, it cannot, with justice, be considered a contemptible rill." (*Eustace*, ii. 210., 8vo. ed.) And a much higher authority than Eustace, Mr. Maclaren, says, that though the Tiber at Rome be not so wide as the Clyde at Glasgow, "it is deeper, and has certainly a larger volume of water." (*Notes of a Tour*, 158.) "Above and below the city it runs through groves and gardens, and waters the villas and retreats of the richer Romans; but beyond *Ponte Molle* it rolls through a long tract of plains and hills, fertile and green, but uncultivated and deserted. Yet these very banks, now all silence and solitude, were once, like those of the Thames, covered with life, activity, and rural beauty, lined with villages, and not unfrequently decorated with palaces. *Euribus prope solus quam ceteri in omnibus terris amnes accolitur aspiciuntque villis.* (*Plin. Hist. Nat.* lib. iii. 5.) Below the city, when it has passed the *Villa Malliana*, it falls again into a wilderness." (*Eustace*, *ubi supra*.) It terminates in a marshy pestiferous tract, its two arms inclosing the *Isola Sacra* of the ancients. (See *antè*, *Rome*, p. 593.; *Cramer's Anc. Italy*, i. 240.; *Matthews; Diet. Geog.*, &c.)

TIERRA (vulg. TERRA) DEL FUEGO, "The Land of Fire," so called from its apparent volcanoes by its discoverer Magellan, or Magallana, a large island, or rather group of islands, lying off the S. extremity of S. America, from which it is separated by the Strait of Magellan. The group, which extends between the 53d and 56th degs. of S. lat., and the 64th and 75th of W. long., consists of King Charles' South Land, Navarin, Hoste, Clarence, and some other islands, Cape Horn forming the most S. point. The E. part of King Charles' S. Land, is low, with plains like those of Patagonia; but near its W. side it is traversed by mountain chains nearly 4,000 ft. in height, covered with perpetual snow. Slate is abundant, but hornblende is said to be the prevailing rock here and in all the ad-

acent islands. (*King in Geog. Journ.*, vol. i.) Lava and other volcanic products have been found. The country, in many parts seems well wooded, and Winter's bark (*Drymis Winteri*), introduced into medicine in 1879, was discovered here. A kind of birch (*Betula antarctica*), with a stem from 30 to 40 inches in diameter, is one of the principal forest trees, and probably other trees may be found; but the interior has hitherto been very little explored. Guano, and foxes appear to be the most numerous wild animals. The Fuegians are a peculiar race of savages, in nearly the lowest stage of barbarism. Their most striking physical peculiarities are a very small low forehead, prominent brows, small eyes, wide nostrils, large mouth, thick lips, long black hair, and large body, as compared with the extremities. They go nearly naked, but smear over their bodies with various substances; live in wigwams made of the trunks of trees, and subsist almost wholly on fish, seals, and testacea. They are occasionally cannibals, and have, in fact, no objection to any kind of food. They are not wholly ignorant of the arts, being acquainted with the use of fire, and the availing themselves of bows and arrows, and in the N. of the *bolos* of the Patagonians. On the whole, however, they would appear to be decidedly below many of the lower animals in respect of comfort, and to be but little above them in sagacity and invention. Their language is said to present many affinities with the Araucanian. (For further and numerous particulars we refer the reader to the *Voyages of the Adventure and Beagle*; Cook; Weddell, &c.)

TIGRIS. See EUFRATES.

TILBURG, a town of Holland, prov. N. Brabant, cap. cant., in the arrond. of Bois-le-Duc, near the Ley, 13½ m. S.W. Bois-le-Duc. Pop. about 11,000. This is decidedly the best built town in the prov., though, from lying out of any great road, it is little visited by travellers. It has 3 churches, a chapel, and a handsome castle; and has very extensive fabrics of fine and coarse woollen cloths, cassimeres, &c. It sends 3 deputies to the provincial states.

TILSIT, a town of the Prussian states, prov. Prussia, reg. Gumbinnen, cap. circ. on the Niemen, or Memel, where it is joined by the Tilse, 60 m. N.E. Königsberg. Pop., in 1838, 11,179. It consists principally of a long and wide street, with a few good-looking houses. The Niemen, which is navigable up to the town, is here crossed by a bridge of boats, 1,150 ft. in length. The exports consist of timber, corn, hemp, flax, provisions, wax, leather, &c., sent down the river in flat-bottomed boats, for shipment at Memel. The cutting of the canal of Oginsky has, by uniting the Niemen with the Dulejor, effected a communication between the Baltic and the Black Sea. It has an old castle, several churches, a royal gymnasium, hospital, and board of taxation, with manufactures of woollen cloth, hosiery, gloves, leather, hardware, &c.

This town is famous in diplomatic history for the treaty signed here on the 7th of July, 1807, by France, Russia, and Prussia. The conferences that led to this treaty were held between Napoleon and Alexander, who met, for the first time, with great pomp and ceremony, in a raft moored in the middle of the Niemen, on the 25th of June.

TIMOR (THE EAST), an island of the E. Archipelago, 2d division (*Crauford*), principally belonging to the Dutch, between the 123d and 128th degrees of S. lat., and the 13th and 15th degrees of E. long., 100 m. S.E. Floris, and 260 m. from the N.W. coast of Australia. It extends obliquely from N.E. to S.W., its length being estimated at 250 m., and its average breadth at 35 m. Horschelmann, in his edition of *Stein's Handbuch*, estimates its area at about 8,800 sq. m., and its pop. at 800,000. The natives of the interior are Papuan negroes; the coasts are inhabited mostly by Malays, Chinese, Dutch, and Portuguese, the latter possessing the town of Dilli, on the N.E. side of the island. Surface mountainous, but without volcanoes. Its rivers are small; and the soil is, upon the whole, not particularly fertile. Sandal-wood and wax are the most valuable products; about 10,000 cwt. a year of the first were formerly exported to Java. The natives cultivate rice, maize, millet, yams, sweet potatoes, and cotton; rice and maize, with the sugar of the lontar palm, and sago, are their principal articles of food. Gold is found both in grains and large pieces; but the aborigines are said to have a strong aversion to search for it, and once massacred a party of Dutch, sent inland to collect the metal. The imports are rice, arrack, sugar, tea, coffee, betel nut, and Chinese, Indian, and European manufactures; the duties on the trade have been said to suffice for the keeping up of the Dutch establishments on the island. The Dutch fixed themselves at Coëpang, on the S.W. coast, in 1630; but we learn, from recent accounts, that they have now all but abandoned Timor for Sandal-wood island, about 300 m. more to the W., which abounds with fertile and grassy plains; and where the

\* Mr. Matthews (*Diary*, &c., p. 78), says, at the Ponte S. Angelo, in Rome, the breadth is about 112 English feet. This is the narrowest point. At the Ponte Molle, the breadth increases; and 2 m. above Rome, the Tiber is nearly twice as broad as within the walls.

colonists are much less likely to be disturbed by the hostility of the natives.

About 300 m. N.E. Timor is Timor Lant, an island 70 m. in length, by about 25 m. average breadth. Little, however, is known as to the state of this island. (*Hamilton's E. I. Gazetteer*, &c.)

**TIMBUCTOO, or TOMBUCTOO**, a town of Central Africa, on the S. border of the great desert of Sahara, about 8 m. N. from the Ioliba, or Niger, but near one of its arms or tributaries, in about lat. 17° 50' N., long. 35° 40' W. Stationary pop., probably 10,000 or 12,000. The existence of this city has long been ascertained; but as till recently it was only known to Europeans by vague reports and suspicious narratives, the most conflicting and contradictory reports have been made respecting it. Certainly, however, the *ignotum pro magnifico* has seldom been more strikingly exemplified than in this instance; the most exaggerated and unfounded statements having been put forth respecting its magnitude, commerce, and pop. These, however, have now been completely dispelled, and Timbuctoo is ascertained to be a very poor town in a wretched country.

It is, in fact, situated amid burning and moving sands on the verge of a morass. It is of a triangular form, about 8 m. in circuit, and is surrounded by walls. The better sort of houses, built of bricks dried in the sun, are large, but not high, consisting entirely of a ground floor. Each house forms a square, containing two inner courts, round which are ranged the chambers, without windows or chimnies, and serving at once for magazines and bed-rooms. But within and without the town are many straw huts of a circular form, serving as lodgings for the poor and for slaves, who sell merchandise for their masters. The streets are said to be clean, and sufficiently wide to allow three horsemen to pass abreast. It has seven mosques, two of the largest of which have walls about 15 ft. in height, and are each surmounted by a tower. It is chiefly inhabited by negroes of the Kisuur nation; but it is also the residence of a considerable number of Moors, who carry on the trade of the town, and who leave it as soon as they have accumulated a little property. The inhabitants are zealous Mohammedans.

The trade of Timbuctoo, though much exaggerated, is considerable, it being a station for the caravans between N. Africa and the Soudan, or Nigritia, and also a *dépot* for their produce. Salt is, however, the staple merchandise of the place. This important article, which is wholly wanting in Soudan, is brought from the mines of Towdeyni, in the desert, about 335 m. N. from the town, being conveyed thither in the form of cakes on the backs of camels. In addition to salt, the caravans from the Barbary States bring dates, stuffs of European manufacture, with fire-arms, gunpowder, hardware, glass ware, coral, tobacco, paper, and other articles, which they exchange for slaves, gold-dust, ivory, ostrich-feathers, palm-oil, gum, &c. Owing to the sterility of the surrounding country, all the provisions required for the use of the town have to be brought from Jenné, on the Niger, about 300 m. S.S.W. Timbuctoo. These are conveyed by an arm of the river to Cabra, whence they are carried by camels, about 3 m., to the town. Jenné, according to Caillie, is a more important, richer, and more commercial town than Timbuctoo. The Touriks, a warlike and savage tribe, on the banks of the Niger, exact heavy duties on all the commodities imported into Cabra, and occasionally commit extensive outrages. Timbuctoo is governed by a negro governor or prince; who receives presents, but imposes no duties either on the inhabs. or the products brought to the town. The government is, in fact, patriarchal, and the prince is said, by Caillie, to be just and good. The slaves, of whom there are great numbers, are well treated.

Timbuctoo is said to have been founded A.D. 1213, and to have soon after become the cap. of a great Moorish monarchy (*Walcknaer, Recherches Géographiques*, p. 14.); and since it ceased to enjoy this distinction, its trade, as well as its importance, is believed to have greatly declined. But it is not at all likely that a town in such a situation should ever have been the cap. of any considerable state; and we are inclined to think that the accounts of its ancient have but little better foundation than those of its modern prosperity. We have elsewhere endeavoured to show, that the commerce of which Timbuctoo is one of the centres depends on natural causes; and that it will, most probably, continue to be carried on in time to come in the same way in which it has been carried on from the remotest period down to the present day. (*See vol. i. 31.*) Ritter, who has collected and discussed the different accounts of Timbuctoo published previously to that of Caillie, has exaggerated alike its importance and its trade, and has farther indulged in some rather fanciful speculations as to the increase of the latter. (*Geography of Africa*, Fr. trans., ii. 81—112.) It would, indeed, be easy to show that the barbarism of Africa depends on natural and permanent, and not on artificial or accidental circumstances;

and though its commerce and civilisation may, no doubt, be materially increased in the course of time, the fair presumption seems to be that, owing to the nature of the country and climate, the wants of the natives and their industry will always be much too limited to admit of their ever becoming extensive demanders of European products. (*See Caillie's Travels to Timbuctoo*, ii. 48—78, Eng. trans. This is not only the most recent but by far the most authentic and best account of the town that has ever been published. See also, *Walcknaer, Recherches sur l'Afrique Septentrionale*, passim., for an account of the progress of discovery in this part of Africa in modern times.)

**TINIAN**, one of the Ladrone Islands, which see.

**TINNEVELLY**, a district of British India, presid. Madras, at the E. extremity of Hindostan, between lat. 8° and 10° N., and principally between long. 77° and 78° E., having N. the district of Madura; E. and S.E. the Gulph of Manaar, separating it from Ceylon; and S.W. and W. Travancore, from which it is divided by a chain of mountains. Area, 5,590 sq. m. Pop., in 1836-37, 807,964. The face of the country is a little undulated, but the general appearance is that of an extensive plain interspersed with small hills. The lower parts are well supplied with tanks, and afford great quantities of rice. On the banks of the rivers are also numerous paddy fields. There are several flats that run to a great distance, on which abundance of cotton is produced; the higher grounds are well cultivated, and covered in the season with luxuriant crops of dry grain. S. of Palmarcottah, towards the extremity of the peninsula, the country becomes sandy and bare, covered in general with Palmyra topes. Towards the E. coast, and all round to the S., there are several hills of red sand, with which the atmosphere is often darkened during the windy season. Close to the sea beach, all along from Tutacurin to Cupe Comorin, the small villages are inhabited by fishermen, who are all Christians, and several Roman Catholic churches are situated close to the sea. (*Madras Almanac*.)

Tinnevely is intersected by many winding rivers, which are supplied with water by both monsoons. The climate of some parts is remarkable. In the N. it is similar to that of Madura, but in the mountains on its W. side are several openings or passes, which, while the rest of the country on the E. side of India is parched up with heat, admit the cool winds prevailing at that period on the Malabar coast. The chief of these is the Aringole pass, near which is Kotalum, a place of great resort for Europeans, on account of its bracing climate.

Rice and cotton are the chief products of this district; the last, which is of the Bourbon variety, is grown of a superior quality. Many fruits, roots, and greens are cultivated, but some of the most common Carnatic products are neglected, and in unfavourable seasons rice is imported from Travancore. While Ceylon belonged to the Dutch, an attempt was made to establish spice plantations in Tinnevely, and cinnamon, nutmegs, &c., were planted, but on our acquiring possession of Ceylon these attempts were abandoned. Tinnevely is assessed under the village system, but for a lengthened period great irregularities attended both the assessment and collection of the revenue. (*See Rep. on E. I. Affairs*, 1832, *App. Recenue*, p. 479; *Hamilton's E. I. Gaz.*) Great improvements have, however, been effected in these branches of late years, and in 1837-8, the total revenue of the district amounted to 24,15,106 rupees.

Tinnevely is subdivided into 11 *talooks* or circles. Its chief towns are, Tinnevely, the cap. and residence of the collector and judge, in about lat. 8° 48' N., lon. 78° 1' E.; and Palmarcottah, the head military station, about 5 m. to the E., where a good many fine cloths, silks, muslins, &c., are made for exportation to Madras and elsewhere. Iron is forged and saltpetre obtained in many parts of the district. The inhabs. of Tinnevely appear to live in greater comfort than those of the neighbouring districts, and their dwellings are mostly well constructed. Mohammedans are few, and the primitive Hindoo manners and customs are scarcely anywhere seen in greater purity. (*Madras New Almanac*; *Parl. Reps.*, &c.)

**TIPERAH**, a district of British India, presid. Bengal, between lat. 23° and 24° 30' N., and the 91st and 92d degs. of E. long., having N. Sylhet, E. the Mymensingh territories, S. Chittagong and the sea, and W. the Brahmputra, separating it from the distr. of Dacca. Area, 6,830 sq. m. Pop., in 1822, 1,372,260. This district yields cotton, rice, and betel nut of a very superior quality. Elephants of large size are found in the forests; and in the S. salt is manufactured. The coarse cotton goods, baftaes, cosnaes, &c. made here are durable and substantial, and were formerly exported in large quantities by the E. I. Company and by private merchants. The inhabs. are similar in most respects to those of the adjacent districts beyond the Brahmputra, though the upper classes have adopted many Hindoo usages. In respect of public education Tiperah appears to be extremely backward. It was acquired by the British in

1765. Total land revenue (1829-30) 810,417 rupees. (*Part. Reports, &c.*)

TIPPERARY, an inland co. of Ireland, prov. Munster, having N. the Shannon, by which it is separated from Galway; E. King's County, Queen's County, and Kilkenny; S. Waterford; and W. Cork and Limerick. Area, 1,013,173 acres, of which 182,147 are unimproved mountain and bog, and 11,328 water. The mountainous districts are in the S.W. Adjoining Waterford and Cork, in the S.E. angle, is Sliabhanna Mountain; and a chain of mountains runs across the co. from Limerick to King's County. The bog is mostly a portion of the great bog of Allen. With these exceptions, Tipperary consists principally of extensive and fertile plains, with a calcareous subsoil, forming as rich land as is to be met with in any part of the empire. Some very large estates, but many of a moderate size. Tillage farms generally small, and mostly held under middle-men. The *con-acre* system is very prevalent in some parts of this co., as it is indeed in most cos. of Ireland, though it be carried to the greatest extent in Connaught. By *con-acre* is meant a pernicious custom prevalent among the landlords and occupiers of the larger class of farms, of letting to the peasantry, or cottiers, small slips of land varying from a perch to half an acre, for a single season, to be planted with potatoes or cropped. Old grass-land is frequently let out on this system; and then it is usual to allow the surface to be pared and burned! The rent of this land is enormous, running from 7*l.* to 12*l.* or 13*l.* an acre! Potatoes are invariably planted on *con-acre* land when it is broken up from grass; and afterwards it is usual to take from it successive crops of corn. Wherever this practice exists, there cannot, of course, be the best improvement; and nothing but the extraordinary fertility of the soil could enable it to produce anything under so destructive a system. But, despite the prevalence of *con-acre*, some considerable improvements have been effected of late years, in the introduction of improved implements and improved stock, the extension of green crops, &c. Grazing, however, was formerly, and still is, the principal employment in Tipperary. The native Irish breed of long-horned cattle attain to a very large size, and are found in the greatest perfection in this co. Many thousands are annually exported. There are also many fine flocks of long-wooled sheep. Average rent of land, 17*s.* 8*d.* an acre. Unfortunately, the condition of the peasantry, instead of being improved with the improvements that are admitted to have taken place in agriculture, is, on the contrary, more depressed now than at any former period; and, in consequence, they are extremely turbulent, and agrarian outrages are probably more frequent in this than in any other Irish co. The manufacture of broad cloth was formerly carried on to some extent at Carrick, but is now wholly relinquished. Tipperary has copper and lead mines, coal, slate, &c. Exclusive of the Shannon, the principal river is the Suir. It contains 10 baronies and 186 par., and returns 4 meens to the H. of C.; 2 being for the co., and 1 each for the bors. of Clonmel and Cashel. Registered electors for the co., in 1839-40, 4,143. In 1831, Tipperary had 60,264 inhab. houses; 66,308 families; and 402,563 inhabs., of whom 197,773 were males, and 204,850 females.

TIPPERARY, an inland town of Ireland, prov. Munster, cap. of the above co., near the Arra, an affluent of the Suir, 23 m. S.E. Limerick. Pop., in 1831, 6,372. It is well paved and cleaned under the superintendence of commissioners, and is, for an Irish town, pretty well built. "Tipperary," says Ingles, "is most agreeably situated, in a fine undulating smiling country, and within a few miles of a beautiful range of hills, which divides the cos. of Tipperary and Limerick. Tipperary, though inconsiderable in size to bear the name of the co., is rather a flourishing town; and is what a mercantile traveller would call 'a good little town.' There is no town westward nearer than Limerick, and there is, consequently, a busy retail trade, the result of country wants. There is also a good weekly market, which makes Tipperary the *dépot* of agricultural produce for a range of 12 or 15 m. round. But, notwithstanding the better circumstances of the tradesmen, I found the condition of the labouring classes little better than elsewhere. Wages were only 8*d.* a day, without diet, and there is nothing approaching to constant employment for the population. Enormous rents, varying from 2*l.* 10*s.* to 4*l.*, are paid for wretched cabins in the suburbs." (1. p. 120.) Tipperary has a par. church, a Rom. Cath. chapel, a Methodist meeting-house, schools on the foundation of E. Smith, a market-house, a barrack, and a bridewell. Petty sessions are held on Thursdays. A chief police magistrate resides here. Markets on Thursdays and Saturdays. Fairs, April 5, June 24, Oct. 10, and Dec. 10. Post-office revenue, in 1830, 738*l.*; in 1836, 1,066*l.* Branches of the National and Agricultural Banks were opened in 1835.

TIRHOOT (native *Tirahuti*), a district of British India, presid. Bengal, prov. Bahar, between lat. 25° and 27° N., and long. 85° and 87° E.; having N. Nepal, E. Purneah, W. Sarun, and S. Bhagulpore and the Ganges,

which separates it from the districts of Bahar and Patna. Area, 7,732 sq. m. Pop., in 1822, 1,097,700. The surface is undulating and well watered; the climate is more healthy than that of the districts more to the S. In the N. there are extensive tracts of waste land, but Tirhoot generally is well cultivated, principally in consequence of the number of British settlers. Mr. Robertson says,—"It is impossible to look on this district without being struck with its high state of culture, and the quantity of forest land which has been brought under the plough, which would probably not have been but for the funds of the Indigo planters, who raised indigo on the ground which had been previously given up to corn." (*Evidence before the Lords*, 1830.) Tirhoot is one of the principal districts in India for the growth of indigo; besides which, sugar, opium, tobacco, turmeric, ginger, rice, &c., are its chief vegetable products, and great quantities of salt-petre are procured from the soil. It also supplies great numbers of cavalry and other horses. Timber abounds in the N., but is of little utility from the absence of roots and the shallowness of the rivers. Total land-revenue, in 1829-30, 1,560,563 rupees. Tirhoot appears to have formed an independent Hindoo principality till 1237. It was annexed to the crown of Delhi in 1325, and acquired by the British in 1765. (*Hamilton's E. I. Gaz.*, &c.)

TIREMONT (Flemish *Thienen*), a town of Belgium, prov. S. Brabant, arrond. Louvain, 11 m. S.E. from the city of that name. Pop., in 1836, 7,996. Its extensive, but now dismantled walls enclose a large extent of ground not built on, with a large square, in which is the ancient town hall, church, &c. It has manufactures of woollen cloths, flannel, and hosiery, oil, soap, earthenware, paper, and sadlery, with potteries, breweries, distilleries, &c. It was formerly much more populous and thriving, having been one of the most important places in Brabant; but being repeatedly taken and retaken by the Spaniards, French, and Dutch, in the 17th and 18th centuries, it suffered greatly in consequence. It sends 2 deputies to the prov. states, and 2 others are sent by its districts.

TITCHFIELD, a market-town and par. of England, co. Hants, div. Portsdown, hund. Titchborne; on the Titchfield river, near the mouth of Southampton Water, 7½ m. E.S.E. Southampton. Area of par., 15,960 acres. Pop., in 1831, 3,712. The town is small, but well built, and is the residence of many families of respectability. A part of the church is said to have been built by William of Wykeham, in the 14th century, and other parts are still more ancient. The living, a vicarage worth 250*l.* a year, is in the gift of H. P. Delme, Esq. There is an independent meeting-house, and a charity school for 24 children. Near the town are the remains of Titchfield House, in which Charles I. took refuge after his escape from Hampton Court, in 1647, built by the first Earl of Southampton, on the site of a former Premonstratensian abbey; but the mansion is now nearly dilapidated, the entrance gateway and the stables being the only extant remains. Titchfield gives the title of marquis to the Bentinck family. Markets, on Fridays. Fairs, Mar. 3, May 14, Sep. 25, and Dec. 7.

TITICACA (LAKE OF). This lake, the largest and most elevated of the S. American continent, is partly comprised in the Bolivian republic, and partly in that of Peru: being enclosed by the Cordilleras S. of the tableland of Cuzco, and extending chiefly between lat. 18° and 17° S., and long. 69° and 71° W., about 135 m. S.E. Cuzco. Its outline is very irregular, being divided by a number of headlands into a main body, of an oblong form, and three subsidiary portions. Its area has been estimated by Mr. Pentland at 4,000 sq. m., and its height above the ocean at 12,795 ft. It is said to be in many places nearly 500 ft. in depth. It contains many small mountainous islands, and from the largest, at its S.E. extremity, the lake has received its name, which signifies "the Leaden Mountain." This island is 3 leagues in length by 1 in width, and about 1 m. from the shore. It is mostly uncultivated, but very fertile; and on it tradition places the first appearance of Manco Capac. (*Pentland, in Geog. Journ.*, v. 82.) The island was consequently held in great veneration: a temple was erected on it by the succeeding incas, in which a great deal of wealth is said to have been accumulated; and this, it is alleged, was thrown into the lake by the Indians on the Spaniards becoming masters of the country. Mr. Pennant states that numerous Peruvian ruins are still found on the island.

The Lake of Titicaca receives several rivers, its only visible outlet being the Desaguadero, which flows S. and is soon afterwards lost in the Lake of Paria. Its waters, though not very potable, abound with fish; and sudden squalls and storms render its navigation rather dangerous. "The low banks of the lake are lined with rushes, which are here of great utility, being employed for almost as many purposes as the bamboo in the E. The huts of the poor are made of rushes; as also mats for the floor, and bed covers. The boats used on the lake are also made of rushes twisted together; the rudder

and the most only being of wood. These boats are frequently made with great taste and ingenuity; the larger venture to some distance from the banks of the lake, which, even in calm weather, is subject to a heavy swell." (*Myrae, Reise um die Erde; Mod. Trav., &c.*)

**TIVERTON**, a parli. and mun. bor., town, and par. of England, co. Devon, hund. Tiverton, on the Exe, where it is joined by the Loman, 13 m. N. by E. Exeter, and 184 m. W. S. W. London. Area of par., which is identical with the parli. bor., about 20,000 acres. Pop., in 1881, 9,766. The town is situated partly on the tongue of land between, and partly on the opposite banks of, the two rivers, each of which is crossed by a stone bridge. It is nearly 1 m. in length. N. E. to S. W., by about 5 fur. In its greatest breadth: it consists chiefly of several tolerably broad and well-paved streets, running N. and S. on both sides the Exe, and mostly joining Fore Street, the main thoroughfare, at right angles. The more narrow lanes and streets are S. of Fore Street.

Tiverton is lighted with gas, and watered by small streams from a branch of the Loman, called the Town leet. (*Bound. Rep.*) On an eminence between the rivers are the remains of the castle, a conspicuous object, occupying about an acre of ground. This fortress was erected in the reign of Stephen, and afterwards came into the possession of the Countenays, Barls of Devon: in the civil wars it was garrisoned by the royalists, but after a short siege was taken by Fairfax. The church, on an eminence near the castle, is reckoned the finest ecclesiastical edifice in the co., after Exeter cathedral. It has a tower 116 ft. in height, and is chiefly in the perpendicular style, though there are some remains of an earlier date, and an enriched Norman doorway. A chapel, built by a merchant named Greenway, in 1517, is a good example of the gorgeous style of ornament which then prevailed. The ceiling is coved, and has tracery and rich pendants; like many works of that time, the design is better than the execution. The church has some rich screen-work. (*Rickman's Gothic Archit.*) In the nave are some curious monumental inscriptions; and the pulpit, which was probably made about the time of Charles I., is ornamented with the arms of many Devonshire families painted in separate compartments. The altar-piece is a rich painting of Peter delivered from prison.

Tiverton consists of several ecclesiastical divisions. Clare, Pitt, and Tidcombe quarters, or portions, are all rectories, in the joint patronage of the Earl of Harrowby, Sir W. Carew, Sir R. Vivian, and the Rev. W. Spurway; the nett value of Clare rectory being 452*l.*, of Pitt with Cove 67*l.*, and of Tidcombe 735*l.* a year. A handsome modern chapel-of-ease has been erected, at which each of the portionists officiates in turn. There are various meeting-houses, a spacious market-house built in 1830, a corn market, town-hall, bridewell assembly and subscription reading-rooms, a neat theatre, &c.

Tiverton has numerous charities. A free grammar-school, in an ancient and venerable stone edifice, founded and endowed by a rich clothier of the town, named Blundell, in 1604, has now an income of nearly 700*l.* a year. It furnishes instruction for 150 boys, and sends 6 students to either of the universities, and 1 to Balliol college, Oxford; and it has 2 exhibitions of 30*l.* a year each, besides other scholarships. Another free school was founded by R. Chilcott in 1611, and there are several minor schools of a similar kind. The almshouses for 9 poor men, founded by Greenway in 1529, have an income of nearly 300*l.*, and the market trust money distributed to the poor by the corporation amounts to 336*l.* a year. The aggregate income of the various charities of Tiverton is estimated by the charity commissioners at 2,600*l.* a year. (*Digest of Charity Repts.*) The manufacture of lace employs from 1,200 to 1,500 people. The town was once famed for its bales, serges, plain cloths, kerseys, and other woollen goods, and even as late as 1612 was regarded as the head manufacturing town in the W. of England; but its manufactures received a severe blow from a most destructive fire, which occurred on the 6th of August, 1612, from which it never fully recovered, and the introduction of Norwich stuffs, in the middle of the last century, completed its decline. At present the woollen manufacture employs only a few hands. The town supplies an extensive rural district, but its trade is not said to be increasing. In 1834, a few small houses of 6*l.* or 6*l.* rent were the only class of buildings in progress in the town; and, on the whole, it may be said to be stationary. (*Bound. Rep. and Mun. Corp. Appendix. 1.*)

Tiverton is now divided into 3 wards, and is governed by a mayor, 5 other aldermen, and 18 councillors. It has a commission of the peace, and a court of record for civil actions to the amount of 100*l.* is held once a fortnight. A jail with 6 cells was built about 25 years since. The Boundary Act made no change in the limits of the parli. and mun. bor., which, as already stated, are co-extensive with the par. Tiverton was incorporated by James I. who also conferred on it the privilege of sending 2 mems. to the H. of C., the right of election, down to the Ro-

form Act, being vested in the corporation, consisting of 26 individuals. Reg. electors, in 1830-40, 436. Corp. revenue, in 1840, 610*l.* Markets, Tues. and Sat., and a large cattle market on the 2d Tues. in each mo. Fairs, Tues. after Whitsuntide and Sep. 29.

**TIVOLI** (an. *Tibur*), a town of the Papal States, comarca of Rome, on a steep ridge, on the Tevereone (an. *Anio*), 18 m. E. by N. Rome. Pop. 6,000. In antiquity, Tibur was to Rome what Richmond is to London; but though in a magnificent and highly salubrious situation, the modern town is dirty and disagreeable, with narrow, steep, and ill-paved streets, and inferior houses. It was a cathedral and some other churches. Tibur or Tivoli, which is one of the most ancient cities of Italy, derives its entire interest from the classical associations connected with its ancient name, its scenery, and its remains of antiquity. The Tevereone, coming here to the edge of the cliffs that separate its valley from the Campagna, is precipitated downwards in a series of cascades, the beauty of which has been admired from the age of Horace down to the present time.

"Me nec tam patiens Lacedæmon,  
Nec tunc Larissæ percutit campis opime,  
Quam domus Albunæ resonantis,  
Et præcepit Anio, et Tiburini lucus, et uda,  
Mœnibus pomeriis rivis."

Hor., lib. 1. Od. vii. v. 10

In modern times, the upper or principal fall was, in a great degree, artificial, from the water having been precipitated over an embankment that had been formed to dam up the river. In 1826, however, one of those destructive floods that occasionally occurred in antiquity (*Plin. Epist.*, lib. viii. 17.), as well as in our own times, swept away the whole of this embankment, along with a church and some contiguous houses, so that the upper fall was nearly destroyed; at the same time that a branch of the river which ran through the town was dried up. But new channels have been since cut, by which, we believe, the river has been again precipitated down a lofty fall.

In the court-yard of an inn in the town, overhanging one of the cascades, is the classical ruin of a temple, supposed to be either that of the *Sibylla Tiburtina* or of *Vesta*, constructed in the reign of Augustus. This beautiful structure is a rotunda, 22 ft. 11 in. in diameter, surrounded by an open portico of composite columns. Though exposed to the weather, without any roof or covering, it is better preserved than might have been expected. "It derives," says Eustace, "much intrinsic merit from its size and proportions, but it is not architectural merit alone which gives it its principal interest. Placed on the verge of a rocky bank, it is suspended over the præcepts Anio, and the domus resonantis of the Nalads; Augustus and Mæcenæ, Virgil and Horace, have reposed under its columns; it has survived the empire, and even the language of its founders; and after 1,800 years of storms and tempests, of revolutions and barbarism, it still exhibits its fair-proportioned form to the eye of the traveller, and claims at once his applause and admiration." (*Classical Tour*, ii. 232. 8vo. ed.)

It may be worth while mentioning that an English nobleman, the late Earl of Bristol, obtained permission from the authorities at Tivoli to take down and carry away this classical ruin, in the view of setting it up again in his park in England! Luckily the desecration was prevented by the interference of the Papal government.

Near this temple are the remains of another, now forming a portion of the church of St George, and an inn in the town is supposed to occupy the site of the temple of Hercules, whence Augustus borrowed the treasure collected by the piety of ages. But, besides these, little remains of the ancient Tibur. But though its temples and its theatres have crumbled into dust, its orchards, its gardens, and its cool recesses, bloom and flourish in unfading beauty. The declivities in its vicinity were anciently interspersed with splendid villas, the favourite residences of the refined and luxurious citizens of Rome. Among these may be enumerated the villas of Sallust, Mæcenæ, Tibullus, Varus, Atticus, Cassius, Brutus, &c. The existing remains of what is supposed to have been the villa of Mæcenæ sufficiently attest its ancient magnificence; but probably the modern *villa d'Este*, erected in the immediate vicinity of the ruin, in the 16th century, by a Cardinal d'Este, exceeds in extent and grandeur that of the minister and favourite of the master of the Roman world! Horace, who has over and over again expressed his admiration of Tibur, is supposed to have had a villa in its vicinity, and some ruins in a delightful situation are pointed out as those of his residence. But, notwithstanding the statement of Suetonius to the contrary, we are disposed, in this instance, to agree in opinion with Eustace, that the probabilities are, that the poet was not really master of a *suburbane villa*, and that all his allusions to the gratifications he experienced in the groves and streams of Tibur—

"circa nemus, vridique  
Tibours ripas opacitas parvus  
Carmine flange."

Hor., lib. iv. Od. ii. v. 30.

may be explained by his frequent visits to the villas of Mæcenas and his other friends.

Such is the mutability of human affairs, that two convicts, which raise their white towers above the dark green shade of the olive trees, are now the most striking structures in the neighbourhood of Tivoli; and that monks loiter away their worthless existence under the shades where Virgil and Horace elaborated their immortal works! (Besides the works already referred to, see *Gell's Topography of the Country round Rome*, art. *Tibur*; *Wood's Letters*, ii. 61.; *Matthew's Diary of an Invalid*, p. 238., &c.)

TOBAGO, one of the W. I. islands belonging to Great Britain; in lat. about  $11^{\circ} 15' N.$ , and long.  $60^{\circ} 40' W.$ , 16 m. N.E. Trinidad, and 82 m. S.E. Grenada. Area, 57,408 acres. Pop. 13,700. "It is 32 m. in length and 12 in breadth, on the N. extremity rugged and mountainous, and from the sea appears like a mass of dark abrupt precipices. Towards the S. and W. the ground descends into a succession of conical hills and ridges of no great elevation, which, as they approach the sea, terminate in broken plain and low lands. The E. district is also mountainous. The soil in the valleys is generally a rich dark mould, and is well watered by numerous streams and rivulets. Cultivation being for the most part confined to a portion of the low lands near the sea on the S. side of the isl., the greater part of the interior is still in a state of nature, the high grounds covered with forests, the deep ravines choked up with vegetation, and the bottoms of the valleys, being very narrow and not possessing free drainage, generally of a wet marshy character. The climate and seasons here are much the same as at Trinidad, only rather more humid; but we possess no measurement of the quantity of rain which falls annually. In some of the low grounds, excluded from the influence of the breeze, the heat is described as being exceedingly oppressive, particularly at Scarborough, the cap., which lies at the foot of a hill on the S. side of the island. The troops enjoy the advantage of a more moderate temperature, being quartered in Fort King George, on the summit of the hill above Scarborough, where the heat is modified by a constant breeze, and the mean temp. of the year does not exceed  $79^{\circ} F.$  On the average of the 20 years ending 1836, the mortality amounted to about 153 per thousand of the white, and 34 per thousand of the black troops, annually, the former being nearly double the rate which prevails throughout the whole Windward and Leeward command. But as the climate has by no means affected the blacks in any corresponding degree, the deaths, on the whole, are considerably less than at most of the other stations." (*Tulloch's Report on the Health of the Troops in the W. Indies*.) This island is beyond the range of the hurricanes; though Grenada, at so short a distance, is as subject to them as the rest of the Antilles. Tobago produces almost every kind of plant that grows in the Antilles, besides many common to the adjacent parts of S. America. It was formerly supposed to have given its name to the narcotic plant tobacco, now so widely diffused; but Humboldt has shown that there is no foundation whatever for this opinion, and that tobacco is a word of Mexican origin. (*Nouvelle Espagne*, iii. 50, 2d ed.) Indian and Guinea corn, peas, beans, figs, pine-apples, and all kinds of tropical fruits, are grown, as well as potatoes, yams, carrots, turnips, onions, manioc, &c. Horses, cows, asses, sheep, deer, &c., probably introduced by the Dutch, have multiplied greatly, and wild hogs are very abundant.

The principal imports into the U. Kingdom from Tobago, during the three years ending with 1839, were

Articles and Quantities.	1837.	1838.	1839.
Sugar (unrefined) - - - cwt.	90,802	71,691	66,844
Rum - - - - - galls.	551,779	292,414	249,545
Molasses - - - - - do.	8,277	7,181	4,012
Cocoa - - - - - lb.	10,226		

The total value of the articles imported into Tobago from the U. Kingdom usually amounts to from 65,000*l.* to 75,000*l.* a year.

Tobago has its governor, council of 9 mems., and ho. of assembly of 16 mems., whose powers are similar to those of Jamaica. It is divided into 7 par. No. of pupils in 18 public schools, in 1839, 1,942. No. of militia in do., 230 men. The sum awarded by government, in 1835, for the manumission of slaves in Tobago amounted to 234,064*l.* This island, which was discovered by Columbus in 1498, was colonized first by the Dutch, and next by the Courlanders. It was ceded to Great Britain by France in 1763. It was retaken by the French in 1781, who retained possession of the island till 1793, since which it has belonged to England. (*Parl. Reports*, &c.)

TOBOLSK, a very large government of Asiatic Russia, comprising a large portion of the basin of the great river Obi, or the country between the 50th and 73d degrees of N. lat. and the 60th and 80th of E. long., having E. the gov. Yeniseisk, S. that of Tomsk and the Kirghiz territ., W. the govs. of Orenburg, Perm, and Archangel, and N. the sea of Kara, gulph of Obi, &c. The area may amount to from 900,000 to 1,000,000 sq. m.; and, in 1838, the pop. was estimated at 685,000. Except on its S. and W. frontiers, it is almost every where level, or but a slightly waving plain, though varying greatly in point of fertility. From lat.  $58^{\circ}$  or  $60^{\circ}$  to lat.  $65^{\circ}$  or  $66^{\circ}$ , the country is generally occupied by vast forests of fir and birch; from the woody region N. to the Arctic Ocean, the country, a low plain called the *Tundra*, is the most sterile imaginable, consisting of all but boundless moors and morasses, interspersed here and there with some stunted shrubs, and occupied by only a few Ostiak tribes, who subsist chiefly by fishing, and the chase of fur-bearing animals. Such is the severity of the climate, that this portion is usually covered with ice, now for about 9 months of the year; and during the other months, ice is always found at a little distance below the surface.

Immediately to the S. of the woody region, or between about lat.  $58^{\circ}$  or  $60^{\circ}$  on the N., and  $54^{\circ}$  or  $53^{\circ}$  on the S., is the agricultural portion of the government, including extensive tracts watered by the Irtysh, a part of the Ishim, and the Tobol. Though not generally fertile, this district comprises some very productive tracts, and it has a considerable number of towns, though few of them be of any great size. Even in this part of the government, the climate is very severe; for, though the summer heats be sometimes oppressive, they are but of short duration, and the winters are long and excessively cold. Rye, oats, barley, and buckwheat are the principal crops. Between the agricultural district and the mountains separating the government from the country of the Kirghizes is the very extensive tract called the Steppe of Ishim, from its being in part traversed by that river and its affluents. Except along the river banks, it is mostly sterile; and in extensive tracts the soil is covered with a salt efflorescence.

Iron and copper are extensively raised in various parts of the Oural chain; and gold and silver are produced both there and in the Altai. At Catherineburg, Kolyvan, and Barnaoul, are extensive forges; and soap and tallow-works, tanneries, mat-manufactories, &c., are found in different parts; but the commerce of the government is of more importance than its manufacturing industry. Except the clergy, and persons in the government employment, all the inhabitants are more or less engaged in trade, exchanging their sable and other furs, cattle, cassia, fresh and dried fish, and game, with the Russian traders for corn, flour, hardware, &c. The merchants of Tobolsk, Toumen, and the principal towns in the S. and W., send every summer boats laden with flour and other provisions, by way of the Irtysh and Obi, to Berezov, and the other small towns in the N., which return with cargoes of fish, and with valuable furs, procured from the Ostiaks and other tribes. These furs are afterwards partly sent, with soap, tallow, and hides, to the fair at Nijni Novgorod; partly to the Kirghiz, to be bartered for horses, cattle, and cotton goods, obtained through Bochara; and partly to Kiachta, on the Chinese frontier, where they are exchanged for tea, silk fabrics, and other Chinese products. The government, in common with the rest of Siberia, lies under the greatest disadvantages with respect to water communication; the frozen shores of its N. coast are inaccessible for the purposes of trade; and its rivers, though equal in magnitude to any belonging to the Asiatic continent, are covered with ice for the greater portion of the year. The chief mode of travelling, and conveying goods throughout a great portion of the government is, as in the N. part of Europe, in sledges drawn by dogs or reindeer.

Mr. Bell and Captain Cochrane agree in representing the Tartar villages in the agricultural part of the government, as neat, clean, and comfortable. Their white plastered chimneys and ovens reminded the latter of his own country. The houses consist in general of one or two rooms. Near the hearth is an iron kettle, and at one end of the apartment a bench covered with mats or skins: on this all the family sit by day, and sleep by night. The walls are of wood, and most a layer of moss between every 2 beams. A square hole is cut out for a window, and to supply the want of glass a piece of ice is often put in: 2 or 3 pieces will last the whole winter. They use no stoves, and have neither chairs nor stools. The furniture consists of a few earthenware utensils, and a set of tea-table appendages. The women never eat or drink till the men have done, and then seldom in their presence. (*Mod. Trav.*, xvii. 322.) Owing to the thinness of the pop., and the immense distances between the different towns, education is very little diffused, and besides the schools in the cap. (see

post), there are, perhaps, hardly a dozen in the rest of the government. Except Tobolsk, the cap., and Toumen, there are no towns worth notice.

Tobolsk, a city of Asiatic Russia, the cap. of W. Siberia, and of the gov. of its own name, and, indeed, of the whole of N. Asia; on the Irish, close to its junction with the Tobol, lat.  $58^{\circ} 11' 42''$  N., long.  $68^{\circ} 6' 15''$  E. Pop., in 1835, 15,379. The town proper is built principally on the flat summit of a hill commanding an extensive view, and is surrounded by a strong brick wall with square towers and bastions. When approached from the W. it has a remarkably fine appearance, and it really contains some good and solid buildings, most of the government offices, and the residences of the Russian and German settlers, being within the walls. Along the banks of the river are suburbs, inclosed by a ditch and palisade, and inhabited mostly by Tartars. Tobolsk had, in 1835, 18 churches, and 1,762 houses, of which only 25 were of stone. (*Ann. de St. Petersburg.*) The streets, which cross each other at right angles, are mostly paved with wood. Among its public edifices, the most remarkable are, the cathedral, in the Byzantine style of architecture, with 5 cupolas, the archbishop's and governor's palaces, a monastery, and a large hospital. The climate in winter is very severe, so much so as sometimes to be very mercury; and next to Yakutsk, Tobolsk is one of the coldest towns in Siberia; but the dress and houses of the inhabs. being fitted to resist its influence, it is not so disagreeable as might be supposed, and, in other respects, it is not an unpleasant residence. The rivers furnish an inexhaustible supply of fish, and provisions, fur, and game of all kinds are cheap and abundant; and shops, theatres, and places of public amusement are numerous. Being on the great road from Russia to China, it is well supplied with most European and Chinese goods; and French wines, English porter, and books of all kinds, are to be met with. Dobell says, "the society of Tobolsk may fairly stand a comparison with that of some of the best provincial towns in Russia." Among the inhabs. are many descendants of the Swedish officers sent thither after the battle of Pultawa, to whom Tobolsk is mainly indebted for its superior civilisation. This city, which was founded in 1587, is the residence of the governor-general of W. Siberia, comprising the govts. of Tobolsk and Tomsk; it has 2 ecclesiastical, and several Lancasterian schools, and various charitable institutions. No convicts or malefactors are sent thither from European Russia, although persons banished to Siberia for political offences are sometimes permitted to reside in Tobolsk. (*Mod. Trav.*, vol. xvii.; *Erman, Reise um die Erde*; *Dobell's Trav. in Siberia*; *Journ. de St. Petersburg.*)

TOCAT (an. *Berisa*), a town of Turkey in Asia Minor, pach. Sivas, on the Tossagiu, near its confluence with the Jezil Irmaak (an. *Iris*), on the military road from Sansoun to Kharpost 35 m. S.S.E. Anassa, and 55 m. N.W. Sivas. Lat.  $40^{\circ} 7' 12''$  N., long.  $36^{\circ} 30'$  E. Tocat would appear to have latterly declined rapidly in pop. and importance. Tournefort, by whom it was visited in the early part of last century, says it was then much larger than Erzerum; and he estimated its pop. at 20,000 Turkish families, with 4,000 Armenian, and 200 or 400 Greek do., which, on the most moderate hypothesis, would make an aggregate of above 120,000 inhab. We incline, however, to think, despite the high authority on which it is made, that this estimate must have been beyond the mark. At all events, the pop. was estimated by Kinnelr, in 1810, at only 60,000; and according to Mr. Brant, by whom it was visited in 1830, it was then reduced to a pop. of 6,780 families (between 35,000 and 40,000 individuals), of which 5,000 were Turkish, 1,500 Armenian, 300 Rom. Cath., 50 Jew, and 150 Greek. The position of the town is striking and singular, being built partly at the bottom, but principally on the declivities of two steep hills, on the side of the narrow valley in which it is situated. Tournefort says that the greater number of the houses, which are mostly of wood, have two stories; and that the streets are pretty well paved, and that the springs rising in the hills on which the town is built are so numerous, that each house has its peculiar fountain. (*Lettres*, ii. 432.) According to the same distinguished authority, it was, at the period of his visit, famous for its copper foundries, its Turkey leather, and its dye works; and was then also the centre of the commerce of Asia Minor. (*Lettres*, *ubi supra*.) But Mr. Brant states that the manufactures and, still more, the trade of Tocat, have greatly diminished; that its numerous khans are empty, and that it has no symptoms of activity. Owing to its situation, the climate at certain seasons is oppressively hot; and it is then, also, apt to be unhealthy. With the exception of the mosques, Armenian churches, and khans, it does not appear to have any building of consequence. The valley, for about 3 m. above the town is occupied by gardens and vineyards. According to D'Anville, Tocat occupies the site of the ancient *Berisa*. (*Tournefort*, ii. 431—438;

*Kinnelr's Asia Minor*, 556.; *Geographical Journal*, vi. 219., &c.)

TODMORDEN, a market-town and chapelry of England, partly in the par. of Rochdale, co. Lancaster, and partly in that of Halifax, co. York, 17 m. N.N.E. Manchester. Pop. about 5,000. The inhabs. are principally employed in the manufacture of fustian, dimity, velveteen, and other cotton goods, with woollen fabrics similar to those manufactured at Halifax and Rochdale. The Rochdale Canal, which passes by Todmorden, has greatly promoted its prosperity, which appears to have increased rapidly within the last 20 years. (*Parl. Reports*, &c.)

TOKAY, a town of Hungary, co. Zemplin, at the confluence of the Bodrog with the Theiss, 113 m. N.E. by E. Pesth; lat.  $48^{\circ} 7' 12''$  N., long.  $21^{\circ} 24' 4''$  E. Pop., 3,500. It has a cathedral, a Lutheran, a Reformed, and a United Greek church, a convent of Piarists, and one of Capuchins, and was formerly defended by a castle demolished in 1705.

Tokay derives its whole celebrity from its being the *entrepôt* for the sale of the famous sweet wine of the same name, made in the hilly tract called the Hegyalja, or submontane district, extending 25 or 30 m. N.W. from the town. The Tokay is produced by allowing the grapes to become over-ripe; the finest quality, or *essence*, being that which flows from the grapes before they are trodden by the mere pressure of their own weight; the next quality (*ausbruch*) is that which is obtained by treading the grapes, with the addition of a certain quantity of *must*, or juice derived from common grapes; the third and lowest quality (*maslas*) is that which is obtained by the application of a greater degree of pressure to the grapes, and the addition of a still larger quantity of *must*. When new Tokay wines are of a brownish yellow muddy colour, which, when very old, changes to a greenish tint. The wine made in favourable seasons will keep for almost any length of time, and continues to improve with age. The best qualities are extremely rich and luscious, but cloying; and, unless very old, too sweet for palates accustomed to austere wines. The finest and oldest varieties of Tokay fetch immense prices, as much as 7 ducats a bottle having been paid for it! The best qualities are usually bought up for the imperial cellars; small quantities being sent as most acceptable presents to foreign princes and distinguished individuals. (*Aust. Nat. Encyc.*; *Henderson on Wine*, p. 228.)

TOLEDO (an. *Tolunt*), a celebrated city of Spain, formerly its metropolis, in New Castle, cap. prov. of its own name, on the Tagus, 38 m. S.S.W. Madrid, lat.  $39^{\circ} 52' 24''$  N., long.  $4^{\circ} 49'$  W. Pop., which in the 15th century is said to have amounted, though this no doubt, is a gross exaggeration, to 200,000, is now reduced to about 15,000. It stands on a rocky hill, nearly encircled by the river, and is encompassed by a wall flanked with about 150 small towers, built by the Moors. Internally, Toledo is acknowledged to be ill built, poor, and mean, with narrow, steep, and badly-paved streets. But Inglis says that, with the exception of Granada, its situation is the most striking of any in Spain. Its fine irregular line of buildings covers the summit and upper part of the hill, behind which, as approached from Madrid, the dark range of the Toledo mountains forms a majestic background. "Besides the numerous towers of its convents, churches, and stupendous cathedral—the metropolitan church of Spain—the outline is broken by other buildings of a more grotesque or more massive form; while, here and there, the still greater irregularity of the outline points to yet too remote to have left to modern times any other legacy than their ruins." (*Spain* in 1830, i. 222.)

Down to the recent changes by which, as already seen (*ante*, 71.), the Spanish ecclesiastics have been stripped of the greater portion of their enormous wealth, the revenues of the archbishop and clergy of Toledo were immense; and the pop. of the city consisted principally, in fact, of priests and friars, and their dependants. The cathedral, founded in 587, is in the same style as those of Seville, Burgos, Milan, Siena, and Bologna. Swinburne says that it is not to be compared with many we have in England; but it has attracted the admiration of most other travellers; and Inglis says that, excepting the cathedral of Seville, it is the greatest and most magnificent of Gothic temples. (*Spain*, &c., i. 304.) According to Twiss, it is internally 384 ft. (Engl.) in length, 191 in breadth, and 107 in height. It has a tower and spire, but the latter is said by Swinburne to be in the style of the Flemish and German spires, a heap of blue turrets piled one upon another. The roof is sustained by 85 columns, which divide the church into five aisles. There are 68 painted windows; and surrounding the choir and the high altar are 156 marble and porphyry pillars. (*Twiss's Trav.*, 182.; *Inglis*.) Its interior is elegantly, as well as most magnificently adorned. The choir is covered with carvings representing the conquest of Granada, executed by Berruguete, a pupil of Michael Angelo, and Philip de

Borgona; and among the paintings are (or at all events were) works by Rubens, Titian, Dominico Greco, Vanduyke, Guido, E. Caxee, Vincente Carducho, Bassano, and other masters of the first celebrity. The ceiling of the sacristy is painted in fresco, by L. Giordano, and has a picture of the Assumption, by Carlo Maratti. The pope and the king of Spain are always canons of this cathedral; and the revenue of its archbishop once amounted, it is believed, to little less than 100,000*l.* a year! The gold, silver, and jewels, the plunder of Mexico and Peru, preserved in the church, mostly escaped falling into the hands of the French. The archbishop carried away the more valuable articles to Cadiz; those that remained in their places being redeemed for the comparatively trifling amount of 90 arrobas, or 2,250 lbs., of silver. Townsend says, that the treasures of the cathedral struck him with astonishment; and in 1830, Inglis was told that their total value amounted to upwards of 40 millions of ducats, or 10,000,000*l.* sterling! We have little doubt, however, that had the generally intelligent, but sometimes credulous traveller, inquired into the fact, he would have found that the *relics*, so precious in the estimation of the clergy, made up the far greater part of this enormous sum. We apprehend that any capitalist who should offer 1,000,000*l.* for all the gold and silver that is at present, or that ever was in the cathedral, would make a very bad speculation.

The Alcazar, once the residence of the Moorish, and afterwards of the Castilian sovereigns, is the other principal edifice in the city. It is a noble pile of 3 stories, surmounted by a balustrade, and forming a square of 256 ft., as measured by Twiss. (*Trav.*, 184.)\* It is built chiefly in the Corinthian and Composite orders, of the dark stone with which the Escorial is built. The N. and S. fronts were erected in the time of Charles V., the former by Covarrabias and Vergara, and the latter by Juan de Herrera. When Toledo ceased to be the metropolis of Spain, the Alcazar was converted into a work-house, and it was subsequently employed for a silk manufactory, established by the archbishop; but it is now untenanted, and so utterly neglected, that in one of its extensive vaults underground, Inglis once entered a party of wandering gypsies assembled round a huge fire.

Besides the cathedral, there are, or rather were, innumerable churches, monasteries, nunneries, and other religious buildings. Few, however, of these are worth notice. The Franciscan convent is, indeed, a fine edifice, and has a church built in the time of Ferdinand and Isabella. The late archbp. Lorenzo established a mad hospital at Toledo; built the modern edifice for the university, which in 1830 had more than 700 students, principally in jurisprudence; and founded a college for girls, each of whom is dowried, provided they do not go into a convent afterwards. There are several other colleges, numerous hospitals and asylums, a handsome town hall, two bridges over the Tagus, one originally a Roman work, bearing a Roman inscription, and terminated on the side by an arch with Corinthian columns; a mint supposed to date from the time of the Romans, &c. There are a few pleasant promenades around the city, but the only public lounge in Toledo is the *Plaza Real*; and here, says Inglis, "at certain hours, particularly about twelve, it seems almost like a convent-hall of recreation, and a sacristy of a cathedral united; for canons, prebendaries, and curates, and 20 different orders of friars, are seen standing in groups, strolling under the piazzas, or seated upon benches, refreshing themselves with melons or grapes." But this square is half monopolized with blacksmiths' shops; and all the others are small, mean, and principally useful as market-places. The houses are mostly floored with brick, and are consequently dusty; and the Roman aqueducts being destroyed, water is sold about the streets, carried in small barrels on asses' backs. There is no public place of diversion of any kind: formerly there was a theatre, but it was suppressed by a royal order obtained through the head of the university. "Full fights even are forbidden in this priest-ridden city; so that unless processions of saints, &c., are to be considered an amusement, the inhabs. have positively no resource but in the *tertulia*. Nowhere are Spanish customs seen more pure than in Toledo, and nowhere is the monotony of the *tertulia* more striking. The sole amusements are talking, or playing *basto* for a very low stake; and after a glass of *agua fresca*, the party separates. In Toledo, a certain circle agrees to form a *tertulia*: one house is selected where it is to be held, and the same individuals assemble at the same house, and at the same hour, every day throughout the year! This is Toledo society. No admixture of foreign, or even of modern innovation, is to be seen in Toledo. Men of all ranks wear the cloak; and the small round high-crowned Spanish hat is worn, not only by the peasantry, but almost universally by

persons of all classes. Among the women no colours are to be seen; black is the universal dress, and scarcely any one enters a church unveiled." (*Inglis*, i. 294, 295—303.) We must add, however, that morals are said to be more correct there than in almost any other Spanish city.

Toledo has, from a remote period, been famous for its manufacture of sword blades. The royal sword manufactory, which is of great extent, and about 2 m. from the city, is close to the river, which turns its machinery. It once employed many hundred hands; but, when visited by Inglis, in 1830, only 50 were employed, who finished about 8,000 swords a year. They work by the piece, and make usually about 100 reals (2*sh.*) per week; some of the most industrious 24 reals more. The art of tempering the steel had, for some time, declined, but it has since revived. "The flexibility and temper of the blades are surprising: there are two trials which each blade must undergo before it be pronounced sound; the trial of flexibility, and the trial of temper. In the former, it is thrust against a plate on the wall and bent into an arc, at least three parts of a circle. In the second, it is struck edgewise upon a leaden table, with the whole force which can be given by a powerful man, holding it with both hands. The blades are polished upon a wheel of walnut wood." (*Inglis*, i. 313.) In addition to its sword manufactory, Toledo fabricates church ornaments, a few woollens, for hospital use, with paper, guitar strings, coarse glass, &c., and has some dyeing and filling works. Its general trade is very insignificant; and a few years since there was no conveyance, nor even a continuous road, between it and Madrid.

The origin of Toledo is lost in obscurity. After having belonged to the Carthaginians it became a Roman colony. Few traces of Roman edifices, however, exist, except part of an amphitheatre, and some scattered remains of the Roman walls. In 467, it was taken by the Goths, and became the cap. of their kingdom in Spain, till taken by the Moors in 714. Alphonso VI. and Rodrigo Diaz expelled the latter from Toledo in 1085; and, notwithstanding three vigorous sieges in the succeeding centuries, it has remained in the hands of the Spaniards ever since. Its decay dates from the removal of the court to Madrid, under Philip II. The celebrated Cardinal de Ximenes, regent of Spain during the minority of Charles V., was, for a lengthened period, archbishop of Toledo. (See *Dict. Géog.*; *Milano*, *Géog. de España*; *Antillon*; *Scribnurne*; *Twiss*; *Townsend*; *Inglis*; *Mod. Trav.*, xix. 50—58; &c.)

TOLOSA (an. *Iuris*), a town of Spain, in Biscay, prov. Guipuscoa, of which it is the cap., on the Oria and Arajes, 13 m. S. by W. St. Sebastian. Pop., according to Milano, about 5,000. It is placed in a narrow defile, surrounded by a pentagonal wall, flanked with towers, and entered by several gates. It is said to be handsome, and well built; the streets, which are furnished with footways, are clean, and lighted at night; and it is tolerably well supplied with water. There are 2 parish churches, both fine buildings, 2 convents, a hospital, prison, post-house, a stone bridge across either river, with manufactures of arms, copper and earthen wares, woollen cloths, paper, hats, leather, &c.; three fourths of its inhabitants being artisans. (*Milano*.) A large market is held on Saturdays. Tolosa is one of the 18 indep. towns in which the provincial assembly of Guipuscoa is held, one of the 4 alternately the seat of the high judicial court of the prov., and the place in which the provincial archives and military stores are kept. (*Milano*; *Antillon*; *Inglis*, &c.)

TOMSK, a town of Asiatic Russia, cap. of the gov. of same name, on the Tom, a tributary of the Obi, 650 m. E. by S. Tobolsk. Lat. 56° 29' 6" N., long. 82° 0' 51" E. "It has nearly 2,000 houses, and from 8,000 to 10,000 inhabs. Here are workhouses for exiles; coarse cloth, leather, and soap manufactories; barracks, public magazines, military and other hospitals; an orphan house, a dispensary, &c. There are a number of handsome houses in Tomsk, but the town is irregularly built, except the part that occupies a hill overlooking the river Tom and the country round. Next to Krasnojarsk, Tomsk is the cheapest and most plentiful spot in Siberia." (*Dobell's Trav.*, ii. 110.) Its principal buildings are the cathedral and another church, the tribunals, treasury (in which are the magazines of furs collected as tribute), and two convents. The inhabs. carry on a brisk trade with the Calmucks and Ostiaks, in cattle, furs, &c.; and the town is an emporium for distilled spirits and Chinese goods. It was founded in 1604.

The government of which Tomsk is the cap. is, with that of Tobolsk, under the authority of the Governor-General of W. Siberia. Since 1838, it has comprised a portion of the former government of Omak; and is supposed to have from 1,000,000 to 1,100,000 inhabs. In 1836, no fewer than 255 ponds 19 lbs. and 3,133 zolot. gold were obtained from the different gold washings in this government. In its general features, it is very similar to

\* Townsend states, "the quadrangle is 160 ft. by 130 ft.; and with the great staircase, the gallery, and the colonnade, has an air of elegant simplicity."

the more southerly parts of the governments of Tobolsk, Yeniseisk, &c. (which see).

**TONNEINS**, a town of France, dep. Lot-et-Garonne, cap. cant., on the Garonne, 30 m. N.W. Agen. Pop., in 1836, ex. comm., 1,176; or inc. comm., 7,088. It is one of the best situated and most active towns in the dep., having a considerable trade in cordage, hemp, and dried fruits, and a royal tobacco factory. It is clean and well built, and communicates with the opposite bank of the river by a new suspension bridge. The esplanade, a good square, on the site of an old castle destroyed in the religious wars; the town-hall, a neat theatre, and some public baths, are worthy notice.

**TOPLITZ** (or *Toplitz*), a town and watering-place of Bohemia, circ. Leitmeritz, and next to Carlsbad, the most popular place of resort of its kind in Germany. It is pleasantly situated on the Saubach, a small stream in a valley between the Erzgebirge and Mittlegebirge mountains, 47 m. N.W. Prague. Its resident pop. amounts to little more than 2,700; but in the height of the season, in July and August, it is sometimes visited by 15,000 strangers. (*Murray's Handbook for S. Germ.*) More than 1-4th part of its houses are inns, and nearly all the rest are lodging-houses. The town has lately been improved in late years by the addition of foot-pavements in the streets, and it is well lighted at night; but it has no buildings worthy of notice, except such as are connected with the baths. The principal baths are distributed in 4 distinct buildings; the Steinbad, Fürstenbader, Fürstliche-Frauenzimmerbad, and the Herrnhaus, or mansion of Prince Clary, the proprietor of the town. All these are in the *Baade platz*, or bath square. The Steinbad includes 3 baths, for the gratuitous use of the public; one for the men, a second for the wives and daughters of citizens, and the third for the female peasantry, &c.; the first and last are under ground, and vaulted over, and may be compared to large underground cellars. In the same house are some very comfortable private baths, supplied directly from the source. The Fürstenbad and Frauenzimmerbad comprise a number of superior private baths; the first for gentlemen, and the second for ladies. In the Herrnhaus, which was the usual residence of the late King of Prussia, when at Toplitz, there are many bathing apartments fitted up with great elegance; and attached to this mansion are some extensive and beautiful gardens, always open to the public, a theatre, &c. The baths in the Girdlerhaus also in the *Baade platz*, the Jews' baths and others are supplied from the main springs. Without the town, and in the neighbouring hamlet of Schönau, are many baths of a lower temperature than in the town. In all there are about 90 private baths, which are in such constant requisition when Toplitz is full, that, by a strict regulation, no person is allowed the use of a bath and dressing-room for more than an hour at a time, for which from 10 to 30 kreutzers are usually paid. The springs are saline, with a dash of iron, the hottest, or *Arseniacale*, has a temperature of about 122 Fahr. It emerges from a porphyry rock, and so abundantly that its supply, per hour, has been estimated at 1,189,670 cubic feet of water. The waters of Toplitz are particularly esteemed in gout, and rheumatic affections, diseases of the joints, &c., requiring tonic treatment. The invalids of the Prussian, Russian, and Austrian armies are often sent here, and lodged in appropriate buildings. Of late years a pump-room has been established in the gardens of Prince Clary.

The hotels and lodging-houses are good and cheap. Dr. Granville says, "The living at Toplitz is, beyond comparison, cheaper than in any other watering place I have visited. A dinner at a *table d'hôte* without wine will cost about 1s. 3d. Apartments may be hired at one of the best hotels, consisting of a bed-room and sitting-room, for not quite a guinea a week." (*Spas of Germany*, 336.) Bathing is the chief occupation of the morning. The dinner hour is 1 or 2 o'clock; the afternoon is commonly spent in excursions; the evening in the theatre or the *salons*; but "except on ball nights, and on the occasion of some great concert, the town is buried in dead silence by 10 o'clock." Public gaming is not allowed; but it is alleged that gambling is, notwithstanding, extensively carried on. Toplitz was the seat of a diplomatic congress in 1813, and again in 1835. (*Granville; Spencer; Gleig; Austrian Nat. Encyc.; &c.*)

**TOPSHAM**, a market town and par. of England, co. Devon, hund. Wotford, on the Exe, where it is joined by the Clyst, 4 m. S.E. Exeter, of which it may be considered the port. Area of par., 1,740 acres. Pop. in 1831, 2,194. It consists of several good streets; the Strand, in particular, at its S. extremity, has many respectable residences, and is inhabited by some families of good fortune. The church is built on an eminence overlooking the river. The living, a perpet. curacy, worth 227l. a year, is in the gift of the dean and chapter of Exeter. The chief business of the town is ship-building, and most of the inns are connected with shipping.

The quay, which was originally constructed in the 14th century, is spacious and convenient; but from the corporation of Exeter (to which it belongs), neglecting to clean the channel of the river, vessels drawing more than 9 or 9½ ft. are unable to come up to it. (*Mun. Append. Rec. on Exeter*.) An active coasting trade is, however, carried on from Topsham. Markets on Saturdays; fair, first Wednesday in August.

**TORBAY**, a spacious bay of the English channel on the S.E. coast of Devonshire. It is of a semicircular shape, opening to the E., and nearly 4 m. across from Torquay or Rob's Nose its N. to Berry Point its S. boundary. Its shores at its mouth are on both sides formed by ramparts of rock, but between these, in the centre, at the bottom of the bay, the ground forms a vale, gently declining to the water's edge. Ships anchor all over the bay in 6, 7, 8, and 9 fathoms water. The ground is strong clay, and holds remarkably well. This spacious basin has frequently afforded shelter to the fleets of England, and is celebrated in history as the place where our great deliverer, William III., landed on the ever-memorable 5th of November, 1688.

**TORGAU**, a town of Prussian Saxony, reg. Merseburg, cap. circ. Torgau; on the Elbe, here crossed by a covered bridge, 66 m. S.S.W. Berlin. Pop. about 5,500. It is pretty strongly fortified, is the seat of the principal courts, &c., for its circle; and has manufactures of woollen cloths and hosiery, leather, &c., with some trade in corn and timber. The vicinity of Torgau has been the scene of several conflicts. Of these, the most important took place on the 23d of November, 1760, when the Prussians, under Frederick the Great, forced, after a desperate resistance, the intrenched camp of the Austrian army, under Marshal Daun, and gained a decisive victory.

**TORNEA**, a town of the Russian dom., N.W. frontier of the Grand Duchy of Finland, on a peninsula in the river Tornea, where it falls into the Gulph of Bothnia, lat. 65° 54' 50" N., long. 24° 12' 15" E. Pop. from 500 to 700. This little town, which was built by the Swedes, in 1602, consists of two principal streets of wooden houses. It has a considerable trade in the exportation of stock-fish, rein-deer, skins, furs, iron, planks, tar, butter, pickled salmon, &c. The climate is very severe, though less so, perhaps, than might be expected from its high latitude. In June the sun is visible at midnight above the horizon.

Tornea is celebrated in the history of science for the visit made to it in 1736, by the French academicians Maupertuis, Clairaut, Monnier, and Camus, accompanied by the Swedish astronomer Celsius, with a view to the determination of the exact figure of the earth. The operations do not, however, appear to have been conducted with sufficient accuracy; and there is a discrepancy of about 200 toises between the length of the degree as determined by the academicians and that measured by the Swedish astronomer Svanberg, in 1801. This town, along with the Grand Duchy of Finland was ceded to Russia by Sweden, by the treaty of Frederickshausen, in 1809. (*Clarke's Travels*, ix. 342, &c., 8vo. ed.; *Schmitzer, La Russie*, &c., p. 624; *Biographie Universelle*, art. *Maupertuis*.)

**TORO**, a town of Spain, in Leon, prov. Zamora, cap. intend.; on a hill, at the foot of which rises the Douro, crossed by a narrow stone bridge of 22 arches, 32 m. N.N.E. Salamanca. Pop. about 10,000. (*Milano*.) It is enclosed by old and dilapidated walls, and entered by 6 gates. The streets, though broad, and on a declivity, are dirty, and the houses indifferent. It has a collegiate, and 18 par. churches. It formerly had 13 convents, with 3 hospitals, a ruined alcazar, or Moorish castle, a palace belonging to the dukes of Berwick, a barracks, a prison, &c. The inhab. are principally occupied in the growing and trading in wine, but they have also manufactures of coarse woollen and linen cloths, brandy, and leather. Toro is of great but uncertain antiquity. It is famous in history for the victory obtained in its vicinity in 1476, by Don Ferdinand of Aragon, over Alphonso V. of Portugal; and for the collection of laws framed in 1603, and inserted in the Spanish statutes under the name of *Leyes de Toro*. (*Milano; Dict. Geog.*, &c.)

**TORONTO**, formerly York, a town of Upper Canada, of which it is the cap., on the N. shore of Lake Ontario, towards its W. extremity, in lat. 43° 32' N., long. 79° 20' W. Pop., in 1838, 12,571. It was founded by Governor Simcoe in 1794, and was burnt by the Americans in 1813. In 1831 it had only about 4,000 inhab., its subsequent progress having been more rapid than that of any other town in Canada. It is now a handsome town, with spacious streets crossing each other at right angles; many of its buildings being of brick, and its timber is gradually giving place. The public edifices are well adapted to their purposes, though none of them has a very striking appearance: they comprise government, parliament, and court houses; a new college, consisting of five brick buildings, the central one being surmounted by an orna-

mental dome, government stores, a gaol, bank, hospital, grammar school, episcopal church, &c. The garrison is stationed about 1 m. W. of the town, where the entrance to the harbour is guarded by a battery and two blockhouses. Toronto harbour, or bay, is formed by a long and narrow peninsula, stretching out to the S.W. for about 6 m., and terminating in Gibraltar point, on which a lighthouse has been erected. The bay is nearly circular, and about  $\frac{1}{4}$  m. across; it has a considerable depth of water, and affords extensive and safe anchoring ground. (*Stevenson's Civil Engineering, &c.*)

Toronto is the residence of the governor, the seat of the superior judicial courts, and the place where the parliament of Upper Canada assemble. A good military road leads from it to Cook's Bay in Lake Simcoe, 37 m. distant. (*Mac Gregor's British America, vol. ii.*)

Kingston, at the other extremity of Lake Ontario, on its N. shore, about 140 m. E.N.E. Toronto was the former cap. of Upper Canada, and though less central has been considered by many as more eligible than Toronto for this distinction. It has an excellent harbour where ships of the line may lie close to the shore; and is also the site of the principal naval dockyard in the colony. It covers a considerable extent of ground, and many of its houses are of stone; it has several good public buildings, and though its pop. had declined, in 1838, to 3,877, it continues to be the principal entrepôt of the trade between the Upper and Lower prov. It was founded in 1783 on the site of Fort Frontenac.

TOROPETZ, a town of European Russia, gov. Pskov on the Toropa, 245 m. S. Petersburg. Pop. about 7,500. It is entirely surrounded by lakes and rivulets, and communicates by the Toropa with Riga, which renders it a place of some trade. It has 13 churches, including a cathedral, and 2 convents. A few of its houses are of brick or stone, but the major part are of wood, the streets also being paved with planks. On an island in the Toropa is a dilapidated fort. This town, under the name of Krivitch, is mentioned as early as the introduction of Christianity by Vladimir, about 960. It was the cap. of a republic, which lasted through the whole of the 12th century, but which in the 13th became subject to hereditary princes. Towards the end of the 15th century it belonged to the Poles, but it was retaken by the Russians in 1500. (*Schnitzler, &c.*)

TORRINGTON, a min. bor., town, and par. of England, co. Devon, hund. Fremington, partly on the summit, and partly on the declivity of an eminence on the E. bank of the Torridge, here crossed by 2 bridges  $\frac{1}{2}$  m. S.E. E. Bideford, and 30 m. N.W. Exeter. Area of par., 3,640 acres. Pop. in 1831, 3,693. It consists principally of two parallel lines of thoroughfares, nearly 1 m. in length, connected by several short streets. The par. church, which had been mostly blown up by an explosion of gunpowder in the civil wars, was rebuilt in 1651; and in 1890, a new tower and octagonal spire were erected. The living, a perpet. curacy, worth 1624 a year, is in the gift of Christchurch Coll., Oxford. It has a market place surrounded by good houses, a neat town hall, places of worship for Baptists, Independents, Wesleyans, &c.; almshouses, a charity or blue-coat school for 32 boys, and various minor charities. Near the town is Stevenston, the seat of Lord Rolle, who cut a canal in 1823, which skirts the hamlet of Taddipole, on the opposite side of the Torridge. At this hamlet, is an hospital for the poor or the pars. of both Great and Little Torrington. A bowling-green now occupies the site of a castle erected on an eminence S. of the town in the 14th century. Torrington is watched during the winter months, but is not lighted; and its police is said to be very inefficient. It has a very indifferent jail. The chief occupation of the industrious classes is the manufacture of gloves, which is not confined to the town, but gives employment to many families of the surrounding district. (*Man. Corp. Rep.*) Torrington appears to have been first chartered by Philip and Mary: it is now governed by a mayor and 3 other aldermen and 12 councillors, who hold petty sessions every 3 weeks. Other courts formerly held have gone into disuse. Corp. rev. in 1840, 2711. Torrington sent mems. to the H. of C. down to the reign of Hen. VII., when it appears to have lost or relinquished the privilege. At the Restoration, the earldom of Torrington was conferred on Gen. Monk; and it now gives the title of viscount to the Byng family. Markets on Saturdays; fairs, May 4, July 3, and Oct. 10, for cattle.

TORSHÉK, or Torloj, a town of European Russia, gov. Tver, cap. distr., on the Tverza, 138 m. N.W. Moscow. Lat. 57° 56' N.; lon. 57° 55' E. Pop. about 12,000. (*Possart.*) It was nearly burnt down in 1767, since which it has been rebuilt with considerable regularity and with rather wide streets, and though its houses are still generally of wood, its public buildings are mostly of stone: the latter include a cathedral and 20 other churches, 2 convents, a government house, normal school, orphan asylum, &c. It is famous for a holy spring, which attracts pilgrims from all directions. Being on the high road from Petersburg to Moscow, and having also the

best inn on this road, it is a place of considerable name, and has three large annual fairs. Its principal manufacture is that of saffron, or coloured and prepared Russia leather. A large traffic is carried on in shoes, gloves, and various articles of this material, embroidered with gold and silver; but the traveller had better be on his guard against imposition, as the dealers not only ask three times as much for any article as it is worth and they will take, but also endeavour to substitute articles made of sheepskin for the genuine leather, which is a preparation of ox hides. (*Schnitzler, Possart, Murray's Handbook, &c.*)

TORTOLA, one of the Virgin Islands, in the W. Indies, belonging to Great Britain, lat. 18° 27' N., long. 64° 34' 45' W., between St. John's and Virgin Gorda. It is about 12 m. in length by 3 or 4 in its greatest breadth. Pop., in 1838, 7,731; of whom, 5,192 were blacks. "This island consists of a range of hills rising in some places to the height of 1,600 ft., and encircling a spacious harbour, or basin; they are, for the most part, barren, rocky, and precipitous, and there is but one valley of any extent throughout the island. The town of Tortola is on the W. side of the harbour at the foot of these hills, which rise so close behind it that many of the houses are built within sea-mark, and consequently suffer from damp. The barracks and hospital for the troops are at the S.E. extremity of the town, and as they lie open to the trade winds, which blow across the harbour, they are not much incommoded by heat. But considerable sickness, particularly from fever, has been found to prevail among the troops at Tortola." (*Tullock's Report, p. 37.*) In 1839, 5,429 cwts. sugar, 7,935 galls. rum, and 11,387 lbs. cotton, were imported into the U. Kingdom from Tortola: the total value of the exports from the island, in 1837, amounted to 24,7291., and that of the imports to 10,4261.

TORTONA (an. *Dertona*), a town of N. Italy, in the Sardinian States, div. Alessandria, cap. prov. of its own name, at the foot of a hill crowned by a ruined castle, 13 m. E. of S. Alessandria. Pop. in 1838, 10,621. It was a place of considerable strength till dismantled by the French in 1796. It is the see of a bishop, the seat of a court of primary jurisdiction, and has manufactures of silk, stuffs, &c.; and some trade in corn and wine. It appears from inscriptions to have been a Roman colony, under the name of Julia.

TORTOSA (an. *Dertosa*), a town of Spain, in Catalonia, on the N. bank of the Ebro, about 25 m. from its mouth, and 93 m. S.W. Barcelona. Pop., according to Mifano, between 10,000 and 11,000. It is defended by several outworks, and is divided into the old and new towns, both of which are walled. It is old and ill built, and has but one public fountain. The cathedral is near the river, and under the protection of the castle. The front is Ionic, with massive pillars, some of single stones; the choir is of Corinthian architecture; but the whole edifice is void of taste, and its interior is much overloaded with ornament. Townsend observed in the cloisters a chapel bearing indications of the most remote antiquity. The see of Tortosa is a bishopric, and was very rich. There are several par. churches, nine convents, a Latin school, hospital, public granary, &c.; but, next to the cathedral, the principal edifices are the bishop's palace, and the mansion of the Vall Cabra family. Tortosa is the residence of a military governor, the seat of an ecclesiastical court, &c., and has manufactures of earthenware, paper, and leather; a considerable trade in corn and silk, and an active fishery and coasting trade. Within a league of the city are some quarries of valuable marble, known as Tortosa Jasper. The *luerta*, or plain of Tortosa, says Townsend, "is most delightful. Far as the eye can reach, you look down upon a plain covered with vines, olives, figs, pomegranates, apricots, mulberries, and all kinds of grain; and through this fertile vale you trace the meanderings of the Ebro, which is here wide and navigable" (iii. 305.). This town had the privileges of a Roman *municipium* conferred on it by Scipio. On one occasion, during the wars between the Spaniards and the Moors, the women of Tortosa distinguished themselves so much, that in 1170 the military order of La Hacha, or the "Flambeau," was instituted for them. They also enjoyed several privileges, most of which are now lost; but it is said that in all matrimonial ceremonies they still maintain the right of precedence. (*Peyron in Mod. Trav. xviii.; Townsend; Mifano.*)

TOTNESS, a parl. and min. bor., town, and par. of England, co. Devon, hund. Coleridge, on the Dart, 9 m. from its mouth, and 20 m. S. by E. Exeter. Area of parl. bor., which comprises the whole par. of Totness with the manor of Bridgetown, 1,411 acres. Pop., in 1831, 4,156. The town, which is neat and clean, consists principally of one long street, that communicates at its E. extremity by a bridge of three arches, with the suburb of Bridgetown, on the opposite side of the river. The town is finely situated, the main street gradually rising from the water till it reaches the site of the ancient castle, now a ruin, on an immense artificial mound, commanding an extensive view of the neighbouring country

It was anciently surrounded by a wall, and some of the gateways still remain. The houses are old fashioned, some of them having piazzas, and their upper stories frequently projecting below the lower. But, with the exception of a few on the Plymouth road, all the modern buildings are in the Bridgetown division; and it is here that a further extension of the town may be looked for (*Mun. Bound. Rep.*) The church is a spacious, handsome structure, in the perpendicular style, with a well-proportioned tower at the W. end, which has octagonal pinnacles and rich buttresses. In the chancel is a rich stone screen: it has also a stone pulpit, enriched with tracery and shields; but the altar-piece is Grecian, and does not correspond with the rest of the building. This church appears to have been rebuilt about 1432. The living, a vicarage worth 200*l.* a year, is in the gift of the crown. There are meeting-houses for Independents, Wesleyans, and Unitarians, an old guildhall and council-chamber, a small theatre, assembly-room, &c.

Judhael de Totinai, to whom the manor was given by William the Conqueror, erected the castle and also a Benedictine priory, which, at the dissolution, had a revenue of 124*l.* 10*s.* a year. It has numerous foundations, among which is a grammar school, established in 1554, having an income of 70*l.* a year. Totness had formerly a thriving woollen trade; but at present it has no manufactures. Many of the inhabs. are employed in agriculture, some in fishing, and some in navigation, the Dart being navigable to the town for small vessels. Warehouses have been built at Bridgetown, on the E. bank of the river, and many houses are building in the neighbourhood. The town has some trade in the importation of coal and other articles, and may, on the whole, be said to be improving. (*Mun. Corp. Rep. Append.*) It was first incorporated by King John; and is now governed by a mayor, 3 other aldermen, and 12 councillors. It has no commission of the peace; but a court leet is held once a year, and petty sessions occasionally. Corporation revenue, in 1840, 200*l.* The bor. has sent 2 mems. to the H. of C. since the 23d of Edward I., the right of voting, down to the Reform Act, having been in the corporation and freemen. Registered electors, in 1840, 40.

Among other distinguished individuals, Totness has given birth to Edward Lye, the learned author of the *Dictionarium Saxonico et Gallico Latinitate*, 2 vols. folio, 1772, and to Dr. Kennicott, the Hebraist, to whom the learned world is indebted for a most elaborate and excellent edition of the Hebrew bible. In his younger days Kennicott was master of the grammar school in the town.

TOUL, a town of France, dep. Meurthe, cap. arrond.; on the Moselle, here crossed by a handsome stone bridge of 7 arches, 13 m. W. Nancy. Pop., in 1836, ex. comm., 7,279. It is generally well built, and its streets have recently been macadamized. Its principal buildings are the cathedral, a fine Gothic structure of the 15th century; the town-hall, formerly the bishop's palace; the cavalry barracks and magazines, civil hospital, corn-hall, college, *abattoir*, &c. Its manufactures comprise calicoes, muslins, woollens, hosiery, and earthenware. This town was anciently the cap. of the *Leuci* conquered by Caesar. It was ceded by Charles the Simple to the Emp. Henry the Fowler, and was not definitively annexed to France till 1552. Baron Louis, Admiral de Riguy, and several distinguished generals have been among the natives of Toul. (*Hugo, &c.*)

TOULON, a famous sea-port town of France, being the 2d, or, perhaps, since the conquest of Algiers, the 1st naval port in the kingdom; dep. Var, of which, though not the cap. it is by far the largest and most important town, at the bottom of one of the finest harbours of the Mediterranean, 32 m. S.E. of Marseilles, and 190 m. S.S.E. Lyons; lat. 43° 7' 10" N., long. 5° 55' 40" E. Pop., in 1836, ex. com., 29,518, and inc. com. 35,322; but in 1841, the pop. was estimated at 45,000; this figure, probably, includes the garrison, and the *forçats* in the *bagne*. The town, which is of an oval shape, the longer side facing the sea, "rises gracefully and majestically towards the N., extending her ramparts to the foot of a chain of high mountains, stretching from the E. to the W. The position of the place would be picturesque and beautiful, were there the least verdure; but the rocks and mountains are arid, bare, and totally destitute of covering, or umbrage of any kind. The town is strongly fortified, being surrounded by a double rampart, and a large and deep ditch, defended to the E., W., and N., by hills covered with redoubts. Among the forts that La Malgue (on a peninsula to the S.W.) is the most remarkable, not only for its extent, but the solidity of its construction. "Later works have been in progress for uniting the town to this fortress, and a solid rampart with fosses has been already raised." (*Ports, &c. of France*, 202—205.) Toulon is divided into the old and new town; both are tolerably well built, but the streets of the former are narrow and crowded, and all the squares, except one, are small and irregular. The new quarter, in which are

most of the naval establishments, is much superior in point of appearance. The principal street, the *rue de Lafayette*, which intersects the town in its whole extent, and is partially planted with trees, is the seat of the principal market, and is a scene of great bustle and activity. It terminates near the port in the *Place d'Armes*, a handsome square, planted with trees, one side of which is formed by the admiralty house. The town-hall, facing the commercial port, with two colossal statues in front, by Puget, regarded as *chef d'œuvre*; the house occupied by that distinguished sculptor, the old cathedral, 3 other churches, the court-house, military arsenal, occupying an ancient convent, naval, military, civil, and founding hospitals, and a handsome communal college, are the other chief public buildings. Though on an arid soil, Toulon is well supplied with water, by springs from the mountains; and several of its numerous public fountains are ornamented with statues, &c. (*Guide du Voyageur; Hugo, &c.*) The suburbs are not only increasing, but, from the rapid augmentation of the pop., and importance of the place, of late years, it has been found necessary to add additional stories to the older houses. Since 1830, two new quarters have sprung up without the walls; one on the road north-eastward to Valette, and the other on the road westward to Ollioules. The latter is filthy, fetid, and abominable. It goes by the name of Navarin, and is chiefly occupied by the Genoese labourers, who occupy the same place in this that is occupied by the Irish labourers in most English towns. Owing to its situation at the foot of high bare hills that intercept the winds from the N., and reflect the sun's rays, the climate in summer is extremely hot. (*Ports, &c. of France*.)

Toulon is the Brest of the Mediterranean, and may be looked upon as the Plymouth of France; though since the construction of the breakwater in Plymouth Sound, the latter is superior, perhaps, as a roadstead to the inner road of Toulon. Both the old and new harbours are artificial. The latter, formed by hollow and bomb-proof jetties, running off from the E. and W. sides of the town, is sufficiently extensive to accommodate 30 sail of the line, as many frigates, and an equal proportion of small craft. The entrance is shut by a boom, and it is never ruffled by any wind to occasion damage. The outer sides of the jetties present two large batteries, even with the water's edge. The entrance to the inner road, on which the harbour opens, is between the *Grosse tour* on the one side, and Fort Eguillette on the other, about 620 fathoms apart: the road is a good deal encumbered with banks, and the anchoring-ground is, in part, foul and rocky; but in other places this is not the case, and altogether it is a very fine basin. The outer, or great roadstead, to the E. of the latter, bounded on the S. by the narrow peninsula, terminating in Cape Cépét, has deeper water and better anchorage than the inner, but it is open to E. winds, which sometimes throw in a heavy sea. The lazaretto stands on a secure cove, La Vêche, on the S. side of the outer road, with from 4 to 8 fathoms water.

The arsenal of Toulon is one of the finest in Europe. It occupies a surface of 334,140 sq. metres (87 acres), and has dry docks, and every accommodation for the construction, repair, and outfit of ships. In general, from 3,000 to 4,000 free workmen are employed within its walls; but in 1841, when unusual activity prevailed in all the French ports, there were between 5,000 and 6,000 labourers employed, exclusive of above 3,500 criminals.

The rope house, constructed by Vauban, is 1120 feet in length and 64 in breadth. The docks, slips, sheds, mast-house, sail factory, magazines, &c., are on a grand scale, though, as a ship-building port, Toulon has hitherto been inferior to L'Orient and Rochefort. A new arsenal meant as an appendage to the old, has been recently laid out. The dépôt of oak timber is the largest in France. The *bagne*, instituted in 1682, is, from want of room on shore, established on board some hulks: it is occupied by criminals condemned to hard labour for 19 years and under. The cost of each criminal amounts to very near 1*fr.* a day.

The mercantile port, which is bordered by a fine quay, is shunt off from the harbour, for men-of-war, by a line of dismantled vessels. (*Hugo*.) The imports consist chiefly of corn, flour, salt provisions, timber, &c., for the use of the naval establishments; and the exports, of oil, canvas, figs, raisins, almonds, oranges, and other fruits, with cloth, hosiery, soap, &c., manufactured in the town. The trade of the port has hitherto been inconsiderable, but it has materially increased since the conquest of Algiers, and will probably continue to increase. In 1841 eight steamers were continually plying between Toulon and Africa, Corsica, Italy, and the East, and two small vessels to La Seyne. Toulon is the cap. of an arrond. and 2 cantons, and is the residence of a naval prefect, a commissary-general, and of numerous other government officers and foreign consuls; it has tribunals of primary jurisdiction and commerce, a board of customs, a college, schools

of hydrography and marine artillery, courses of geometry and mathematics, a society of arts, and an excellent naval museum, public library, government, pawn, and savings' banks, a theatre, with a stationary company, public baths, &c.

Toulon appears to have existed in the time of the Romans. In more modern times it was occasionally attacked by African corsairs, and to defend it from these incursions, Louis XII. commenced the erection of the Grosse-tour at the entrance to the inner road, which was finished by Francis I. Henry IV. commenced the construction of the old port, now appropriated for merchant vessels in 1594. But it is wholly indebted for its modern importance as a great naval port and a strong military position, to Louis XIV., who expended vast sums on its fortifications, and on the arsenal and harbour. It was unsuccessfully besieged by Prince Eugene in 1707. Having, in 1793, been delivered up by the royalists to the English and Spaniards, it was retaken by the republicans, after a siege in which Napoleon gave the first decided proofs of his extraordinary military talents. On evacuating the town the allies set fire to the magazines, and to the ships they were unable to carry off; the fortifications have since been thoroughly repaired, and several new works constructed, so that it is stronger now than ever, and if properly garrisoned would be all but impregnable. (*Ports and Arsenals of France; Hugo, Art. Var.; Guide des Voyageurs en France; Dict. Geog.*)

TOULOUSE, or THOULOUSE (an. *Tolosæ*), one of the principal and most ancient cities in the S. of France, dep. Haute Garonne, of which it is the cap., on the Garonne, at the junction of the canals of Languedoc and Briare with that river, 132 m. S.E. Bordeaux; lat. 43° 35' 46" N., long. 1° 26' 30" E. Pop., in 1836, ex. com., 68,015; or with com., 77,372. Inglis calls it a fine large flourishing place, situated in the midst of abundance, and containing many fine edifices, and remarkable objects (*Switzerland and the Pyrenees*, 215.); but, according to Hugo, Toulouse, before the revolution of 1789 was *fort laide*, and is still far from being a fine town, notwithstanding all that has been done for its embellishment. It is very irregularly laid out; its streets, which are mostly narrow, crooked, ill-paved with rounded pebbles from the river, and dirty, form a complete labyrinth. Nearly all the buildings are of red brick cemented with bad mortar, which, being blackened by age, gives the town a gloomy appearance: the older houses, and those in the lower quarters, consist of sun-dried bricks, in frames of wood work, and are greatly dilapidated. But within the last 20 years the civic authorities have undertaken many improvements: *on enlargit, on redresse les principales rues; on plante ce qu'on ne peut rebâtir; on ussaint ce qu'on ne peut embellir; on déblait les anciennes places, on en forme de nouvelles; on jette à bas des constructions religieuses, inutiles depuis la suppression des convents; on utilise des églises abandonnées.* (Hugo, *art. Haute Garonne*.) The shape of Toulouse is an irregular oval; the city comprises an island in the Garonne, and on that side is bordered by good quays: on other sides it has been till lately inclosed by walls, flanked with large round towers. But these are gradually disappearing; and their place is being occupied by good houses, and regular streets. Inglis says that he had not seen any provincial town in France with such extensive suburbs as Toulouse. The city communicates with the suburb of St. Cyprien, across the Garonne, by a massive free-stone bridge of 7 arches, built in the latter half of the 16th century, at the further end of which a modern triumphal arch has been erected.

The principal open space is the *Place du Capitole*, serving for the grand daily market, which, according to Inglis, is admirably supplied. This large quadrangle is ornamented at each of its four corners with a handsome fountain. The capitol, or town-hall, from which it derives its name, on its E. side, in the Ionic order, is nearly 130 yards in length. In it are several spacious halls; one is ornamented with the busts of the most distinguished natives of the city; and another, called the *Salle de Clemence Isaura*, has a marble statue of that distinguished lady, the great patroness of the "Floral Games." The theatre occupies one wing of the capitol; but it is badly planned and decorated. The other sides of the square are chiefly occupied by hotels and cafés. Several of the other squares are ornamented with fountains, and planted like the public promenades on the banks of the canals, and the Garonne.

Several of the churches are worth a visit. The cathedral is planned on a magnificent scale, but unfinished: the nave, which is the oldest part of the building, probably dates from about the 13th century. The most ancient church, that of St. Serrin, has been erected, according to Hugo, on the site of a very celebrated temple of Apollo: it is a heavy Gothic building, part being said to date from the 9th century, though the greater portion is much more modern, particularly the choir. Among its ornaments, if so we may call them, Inglis noticed a *bas-relief* caricature of Calvin, as a hog in

a pulpit preaching! and that there might be no mistake in the matter, the words, *Calvin le porc prêchant*, were inscribed below! This church is rich in relics presented by several popes, and other persons: it has a cupola supporting a lofty spire. The churches of La Daurade and Dalbade deserve mention: in the former Clemence Isaura is supposed to have been buried, and on the grand altar are preserved the golden flowers presented to the successful poets at the floral games. Toulouse is said to have had, at one period, 80 churches, but many have been converted to other purposes. One serves for the museum, in the picture gallery of which are some productions of the best masters of Italy, with a much larger number of copies; while in the cloisters attached is a fine collection of antiquities excavated near Martres, in 1827. The best modern building after the capitol, is the prefecture, formerly the archbishop's palace.

Toulouse was till recently ill supplied with water: but it is now amply provided with that great necessary, furnished to numerous public and private fountains from a handsome *château d'eau*, or reservoir. Among the other public buildings may be specified 2 large hospitals, the *Ponts-Jumeaux*, or double bridge over the 2 canals at their junction, the veterinary school, public slaughter-house, mint, new edifice for the royal court and tribunal of primary jurisdiction; the public libraries, containing together about 60,000 vols., school of artillery, barracks, arsenal, polygon, gunpowder and other large mills, &c. Toulouse is the cap. of the 10th military div. of France, and an archbishop's see. Previously to the Revolution it was the seat of one of the leading French universities; and it has now a university academy, with faculties of law, sciences, literature, and theology: it has also a royal academy of sciences, &c., societies of medicine, painting, arts, and agriculture, some of which grant prizes to successful candidates, after the example set at the floral games of old. The *Jardin des plantes* at Toulouse is the largest and finest in France after that of Paris. (*Guide du Voyageur*, &c.)

The floral games, previously alluded to, appear to have been instituted in the early part of the 14th century. They were originally held on the 1st of May; and consisted of a trial of skill among the poets and *troubadours* of the vicinity, those who recited the best verses receiving the prize, which consisted of golden flowers. Clemence Isaura, the lady mentioned as the great patroness of these games, bequeathed, in 1540, the bulk of her fortune to the civic authorities, to be expended by them in fêtes and prizes at floral games, to be held annually in her house, on the 1st and 3d of May. These games were finally superseded by the creation of the academy of *belles lettres* in 1694, the directors of which gave prizes for the best papers.

Toulouse has manufactures of coarse woollen cloths, silks, gauzes, printed cottons (*indiennes*), cotton yarn, flies and steel wares, paper, wax lights, musical strings, and vermicelli, with dyeing-houses, distilleries, a cannon foundry, and a royal tobacco manufactory. It has also a large trade in the produce of the surrounding country, Spanish wool, and colonial produce. Inglis says, "The neighbourhood of Toulouse will be found one of the cheapest places of residence in Europe. Within the city, every thing is about one fourth part dearer than in its immediate vicinity, owing to the *octrois*. But in the markets held in the neighbouring villages, meat is sold at 3d. and 3d. per lb.; fowls are not more than 10d. a pair; a fine turkey costs but 2s. 6d. or 3s.; eggs, fruit, and vegetables are remarkably abundant and cheap; and wine does not exceed 1½d. per bottle. The country is thickly covered with country-houses; and one of these, furnished, and suitable for a small family, and with an excellent garden, may be had for 400 fr., or 154, per annum."

Nothing is known of the origin of this city but that it is very ancient. It was the cap. of the *Tectosages*; and having been taken by the Romans, *anno* 106 B.C., they afterwards embellished it with numerous splendid edifices; but owing to the combined influence of time and the attacks of the barbarians, these structures have been almost wholly destroyed, so that some vestiges of the amphitheatre, and of a few other buildings, are all that now remain to mark the wealth and power of its Roman masters. It was successively the cap. of the Visigothic kingdom of Gaul and Aquitaine, and was thenceforward governed by its own feudal counts till 1271, when it was annexed to the crown of France.

Toulouse is principally celebrated in recent times for the sanguinary conflict that took place in its vicinity on the 10th of April, 1814, between the allied army, under the Duke of Wellington, and the French, under Marshal Soult. The allies were superior in point of numbers, but the advantage of position was on the side of the French. Notwithstanding a desperate resistance, the latter were driven from the Mont Ilave, and obliged soon after to evacuate the city. The loss on both sides was very great, especially on that of the victors, who had 4,659 men killed and wounded: the French loss amounted to about

3,000 men. Unfortunately, this was a useless sacrifice, as Napoleon had already abdicated; but, though the contrary has been stated, it is certain that Marshal Soult was wholly ignorant of the circumstance. (*Napier's Peninsular War*, iv. 638, &c.)

The habits of Toulouse appear, even in the estimation of their countrymen, to be endowed with a very large share of that versatility which has been said, though, perhaps, without much foundation, to be a distinguishing trait in the French character. "Comme l'exécution n'est pas précédée chez le Toulousain d'un jugement réfléchi, il se livre malheureusement, avec trop de facilité, aux excès dont ensuite il a lieu de se repentir: ainsi, on le voit massacrer, en quelque sort avec joie, les Protestants lors de la St. Barthélemy, et durant les guerres du Calvinisme; le vertueux président Duranton, à l'époque de la Ligue; les royalistes pendant la Révolution, et les patriotes à la Restauration: il accueille avec transport Napoléon durant son règne, et plus tard, avec le même enthousiasme, Wellington et son armée; il assassine ensuite le général Lapelle, qui veut le sauver de l'anarchie; il est toujours jouet de la versatilité de son caractère, et de l'instrument le plus docile de toutes les scènes de barbarie auxquelles le poussent les hommes ardents qui veulent l'égarer." (*Dict. Géog.*)
